The six hot mills of the new tin plate plant of the Columbia Steel Corporation, San Francisco, at Pittsburgh, will be furnished by the United Engineering & Foundry Co., Pittsburgh, Calif.; the six cold mills by the Hyde Park Foundry & Machine Co., Hyde Park, Pa.; the hot mill drives by the Mesta Machine Co., Pittsburgh, and the cold mill drives by the Gears & Forgings, Inc., Pittsburgh.

Coming Meetings

October

American Gear Manufacturers Association. Oct. 11 to 13. Semi-annual meeting, Statler Hotel, Buffalo. T. W. Owen, 3608 Euclid Avenue, Cleveland, secretary.

Society of Industrial Engineers. Oct. 17 to 19. Fifteenth national convention, Hotel Seneca, Rochester, N. Y. George C. Dent, 205 West Wacker Drive, Chicago, secretary.

American Refractories Institute. Oct. 24. Fall meeting, Vanderbilt Hotel, New York. Dorothy A. Texter, 2202 Oliver Building, Pittsburgh, secretary.

American Iron and Steel Institute. Oct. 26. Fall meeting, Commodore Hotel, New York. E. A. S. Clarke, 75 West Street, New York, secretary.

November

Engineers Society of Western Pennsylvania. Nov. 2. All day discussion of welding, William Penn Hotel, Pittsburgh.

American Management Association. Nov. 13 to 15. Fall meeting, Palmer House, Chicago. W. J. Donald, 20 Vesey Street, New York, managing director.

American Institute of Steel Construction. Nov. 13 to 17. Sixth annual meeting, Biloxi, Miss. Charles F. Abbott, 285 Madison Avenue, New York, executive secretary.

American Society of Mechanical Engineers. Nov. 14 and 15. Iron and steel division, Chicago. Thomas Wilson, 7 South Dearborn Street, Chicago, chairman local section.

Second International Conference on Bituminous Coal. Nov. 19 to 24. Carnegie Institute of Technology, Pittsburgh.

Society of Automotive Engineers. Nov. 22 and 23. Production meeting, Book Cadillac Hotel, Detroit. C. F. Clarkson, 29 West Thirty-ninth Street, New York, general manager.

This Issue in Brief

Cost records show that maintenance of machines in apprentice department of electrical equipment plant is slightly lower than for same machines in production line. This is probably due to close supervision of students and more deliberate pace of operations.—Page 880.

* * *

Combination of high temperature with reducing atmosphere in atomic hydrogen welding gives unusually strong ductile welds at a rapid rate. The welds are free from oxides and blow holes, and have smooth finished appearance.—Page 883.

* * *

Building contracts in September set high record for that month. Dodge reports for 37 States east of Rocky Mountains show 14 per cent gain over August and 13 per cent increase over September, 1927. Decline of 15 per cent in value of projects contemplated indicates lower construction during remainder of year.—Page 942.

* * *

Margin of profit said to be growing smaller in reinforcing steel industry in spite of increased sales and better relations with mills. Institute president blames diminishing returns on price cutting within industry and lack of sincerity among competitors.—Page 901.

* * *

Success of airplane industry demands use of efficient machinery for large scale production, says aeronautical engineer. There must also be standardization of product, method and materials, and manufacturers must cease to experiment with too many different types of planes and motors.—Page 893.

* * *

Training of apprentices costs General Electric Co. about \$4,000 per man. Permanency of employee, however, cuts cost to about \$2,800 and debit is immediately wiped out if man enters supervisory position.—Page 881.

Purchasing agent should know what constitutes practical mill practice and should insist that designing and production department adopt reasonable standards and specifications, says flat-rolled steel association head. Large savings could be realized if consumers' designing and inspection department heads could meet with steel makers and adopt practical standards and specifications covering flat-rolled steel.—Page 892.

* * *

Mechanical devices lessen possibility of accidents in foundry. Safety engineer holds that mechanical handling of raw stock, the pouring of molten metal by mechanical means and the installation of modern type of conveyor systems would reduce accidents in foundry to minimum.—Page 897.

* * *

Narrow profit margins per sales dollar have come to stay in industry, analysis shows. Sales at prices closely approximating cost of production are dominant factor in determining commodity prices, forcing producers to seek profit by volume rather than by individual sales.—Page 882.

* * *

September steel ingot production was largest ever recorded for that month. Output of 165,903 tons daily was highest since April and exceeded any previous month in second half of year. Nine months' production was greater than any corresponding period in past by 1,240,000 tons.—Page 907.

* * *

Iron and steel make up 54.2 per cent of materials used in well known airplane engine. Aluminum and its alloys are used as far as possible but are not advantageous for highly stressed parts. Aluminum is not as strong as alloy steel and sections cannot always be increased to offset reduced strength. Steel is always used when extreme hardness is needed.—Page 898.

Extension of conveying equipment in Cadillac plant provides for many economies. Assembly conveyors for axles act as automatic pace setters and split up operations to permit carrying out progressive assembly to fuller extent than was possible under old methods. Discarding of old type floor stands and dolly trucks on casters permits solid support for work during assembling operations.—Page 889.

* * *

All steel received at forge plant is given pile number, and samples from each heat are analyzed and recorded. This system follows work through process and affords identification for steel until finished forging is shipped. Record is kept on file providing check long after forging has gone into service.—Page 888.

* * *

Executive who assumes it is right to bring all pressure to bear upon his purchasing department to secure the lowest possible price in mass buying is doing business as it was done 3000 years ago, says association head. Insistence on unreasonably low prices is "profiteering," and industry which does this must suffer in the end.—Page 892.

* * *

Forging furnaces in Cleveland plant are connected with recording pyrometers and have individual automatic control equipment working through Geisinger valves. Control of heating furnaces is being conducted in experimental way in connection with special forging work and control equipment is being used with view to holding heat control of furnace to closer limits.—Page 886.

* * *

Camshafts in automotive plant are handled from operation to operation on overhead endless chain conveyor 600 ft. long. Saving in space has made room for additional line of machine tools, and number of units on floor or on truck going through department has been greatly reduced.—Page 891.

ESTABLISHED 1855

Voluntary Price Maintenance

IN what may be called the voluntary maintenance of prices there has been much favorable experience in the last few years among various classes of manufacturers. We say the experience has been favorable, for it is obvious that indiscriminate price competition would have sent prices of many commodities well below the full cost of production if not below the bare factory cost. Those who speak out concerning inadequate profits are not to be upbraided for complaining, but it would be well if they considered now and then how much worse things might be. There are few manufacturing lines in which demand does not fall quite short of productive capacity.

While there is reason for urging that the anti-trust laws should be amended, that should be done with eyes wide open to the fact that no panacea could be offered by any amendment likely to be adopted. There is the experience of the past as a guide. When the Sherman law was lightly regarded and when there was no Sherman law there were price agreements and in the majority of cases they did not hold for any length of time, if at all. Even when there were forfeits, or contributions to a general fund for periodic distribution, there were evasions. When an arrangement broke up, it was the usual experience that the latter state of the industry was worse than the first.

It is the will to play fair that counts, and when there appeared to be a tight agreement there was the more temptation to attempt evasion. Not so when there is an open market. A price cut nowadays is known almost immediately, and that furnishes its own incentive to each seller to adhere to the known market. In the old days evasions of a definite agreement were much longer lived.

Supreme Court decisions under the present laws permit trade association data of transactions that have been closed, as in the maple flooring case, while data as to prices that are being quoted, as in the linseed oil case, are inadmissible, since they are related to future sales. It is difficult to see how any great hardship is involved in this particular point, for the competent sales organization generally knows just what is being quoted.

Sight is often lost of the fact that the typical self-respecting seller does not wish to undersell his competitors. His normal and natural ambition is to oversell his competitor, just as he wishes to produce better goods and render better service than his competitor. The will to do the constructive thing is what counts. It is fair to ask whether that would not be undermined if sellers were given freedom to enter into price agreements.

There is a wide range of activities in which trade associations may engage, fully and clearly within the law. It may be that the range should be increased or should be still more clearly defined, but anything done in that direction should be by way of increasing the will to play fair and not of providing temptation to do otherwise.

In respect to the improvement of trade associations, a suggestion will not be amiss. Very properly these associations aim to keep within the limitations of the anti-trust laws. There is no doubt that some members at times make inaccurate reports of their sales. In so doing they violate the common law against disseminating false information for the purpose of enhancing or undermining prices, and incidentally they injure the associations to which they belong.

Cheapness at a Price

SEeking volume of business at the expense of prices has been much condemned by leaders in the steel industry and in other quarters, as tending to wipe out profits, if not to produce losses. Yet two independent investigations concur in finding that corporate profits depend not only on an increasing volume of business, but on a declining margin per sale. An analysis of profit ratios to sales and capital investment for 4000 corporations, as made by the National Industrial Conference Board and reviewed elsewhere, confirms the conclusion previously reached by Harry A. Bullis in an inquiry undertaken for the National Association of Cost Accountants and summarized in *THE IRON AGE* of Sept. 20. It showed that the general profit trend for larger corporations is upward and is accompanied by a decreased percentage of profit with respect to selling price.

Narrow profit margins have come to stay, says the Conference Board, because progress in industrial mechanization has produced an irresistible trend toward large-scale enterprise and mass production.

If this be a true picture of what confronts American industry and if all the big business of today is inevitably to become the bigger business of tomorrow, we are headed for a regime in which our boasted individualism may fare hardly. Mass output in demanding mass consumption puts the individual on a new pedestal of importance as a user of products. For him a new era of comfort may be had, but even though he be the gainer in this material way, the question may well be raised whether he will not suffer offsetting losses. The average American finds satisfactions in independence, in steering his own course in the business sea, that are more appealing than a position of nonentity in

an economic order whose chief promise is that he can buy cheaply.

In distribution also the march of the mail order houses and chain stores, and latterly of the scattered branches of the mail order houses, goes on without a halt. We are told that all this is to make for the same efficiency in distribution that as applied to manufacture has displaced thousands of men and forced them to find employment as purveyors of various forms of service. And now the question arises, What employment shall be found for the thousands who must be displaced in distribution lines, in the elimination of the individual wholesaler and the retail merchant, if the promises of new economies there are to be made good?

Enthusiasm for consolidations may be warranted by the cold facts of efficiency, and in certain branches of industry and of distribution further engrossment by large organizations may indeed be inevitable. But some of this cheapening of products and of merchandising may be dearly bought if it means the closing of the door of opportunity against the smaller manufacturer and merchant.

Instalment Buying and the Retailer

NOT so much discussion of easy payment buying has appeared in economic and financial reviews of late as we saw last year, particularly in the weeks following the publication of the Seligman report, which found that no economic danger inhered in widespread buying on the instalment plan. However, the American Bankers' Association gave the subject a place on its convention program at Philadelphia last week and a paper by C. F. Zimmerman of the Pennsylvania Bankers' Association pointedly opposed Professor Seligman's view. Thrift is a familiar preachment of the banker and it was quite to be expected that the author of the Philadelphia paper would sharply contrast families whose income as received is parceled out among instalment sellers with "those who, in addition to their habits of thrift, are learning to make good use of all the facilities of the bank."

But quite aside from the self-interest of a banker's view of the family exchequer, the following comment finds ample confirmation in the experience of tradesmen in many communities:

Despite the fact that one of our leading economists has recently pronounced in favor of the "easy payment plan," most bankers continue to have the feeling that a great deal of instalment buying is an economic evil, and this conviction is based upon a knowledge of the havoc it works in so many families.

The country banker knows so much about the results of mistaken policies in handling the family income, that he is compelled to doubt seriously the wisdom of instalment purchasing so far as it concerns an overwhelming percentage of the people. Possession of attractive, relatively expensive but practically unnecessary articles for a small down payment, has a lure in it that misleads and very seriously entangles those who have only their earnings to depend upon.

As the butcher, the baker, the grocer can testify, the instalment seller is the preferred creditor always, while the local tradesman waits long and anxiously and often in vain. The survey of retail buying now being made

under Federal auspices would do a large service if it could discover how far instalment buying is responsible for the parlous condition of many a local tradesman which it is usual to charge entirely to the incompetency of the retailer himself.

Relative Value of Farm Products

THE latest reports set the volume of the cereal crops this year as follows:

	Bushels
Corn	2,931,000,000
Oats	1,454,000,000
Wheat	901,000,000
Barley	436,000,000
Rye	43,000,000

The value represented is estimated at about \$4,400,000,000, which makes a high figure, often spoken of as created wealth, though more properly it represents a turnover. A large turnover going through one particular channel, whether it be agriculture, building construction, the manufacture of automobiles, or what not, involves further turnover, with broad ramifications. Business in steel and in other lines has already been stimulated by this year's crops.

It is the economic or financial position of the farmer that is so much talked of. The statistics themselves are somewhat confusing and when the politicians take the statistics they are likely to confound the confusion.

One difficulty arises from entirely recasting the most trustworthy of the long-range price series, that of the Bureau of Labor Statistics at Washington. The original series took the ten-year average, 1890-99, as base. The averages for 1913 were 165.8 for farm products and 135.2 for all commodities, showing that the farmer's position had greatly improved. Later a new system was instituted, taking 1913 as base, and thus giving the farmer very decidedly "the edge." For 1926 the figures, based on 1913, were 142.2 for farm products and 151.0 for all commodities, showing the farmer not altogether as well off as in 1913, but much better off than in 1890-99. Now the index numbers are based on 1926, and for last August showed 107.0 in farm products and 98.9 in all commodities.

A reasonably close approximation to the statistical position of the farmer at the present time, relative to 1890-99, may be obtained by taking the continued product of the respective numbers, which gives 252.3 for farm products and 201.9 for all commodities, relative to prices in the ten years 1890-99. Thus the farmer is shown to be 25 per cent better off. We are not trying to maintain that he is better off by 25 per cent or less or more than that amount, but it is clear that if statistics are to be used at all these statistics must be regarded. Indeed, a corresponding computation using the 1926 base, as recently carried back by the Bureau of Labor Statistics to 1913, shows farm products up 30 per cent, instead of 25 per cent, compared with their relationship in the 1890 decade.

Why should prices rise at all? Other things being equal, they should decline as we grow more efficient and can produce things, whether grain, farm implements, automobiles, breakfast food or tooth paste, with less physical and mental effort. Pig iron has declined relatively. Based on 1890-99 as 100 it now stands at about 142 against 202 for commodities in general. Its

relative decline has been 30 per cent against the relative advance of 25 per cent in farm products.

What the individual is interested in is profits, or if not precise profits then how much he can get of the particular things he feels he should have from the revenue the circumstances afford him. The farmer's complaint cannot be based upon the bare statistics, for on the whole, by any broad comparison, they are against him. He may base his contention upon the things which are sometimes referred to as yesterday's luxuries but today's necessities—whether he is getting his share of them—or he can urge that he should receive a larger proportion of what the general public eventually pays for his products. He is not likely to get public sympathy if he asks that the consumer be made to pay more money.

GERMANY continues to make strides in fuel conservation, far outstripping other countries in the briquetting of low-grade coals, as has been the case for many years. Nearly 36,500,000 tons of lignite briquets and 5,000,000 tons of coal briquets was the German output last year, or more than 82 per cent of a world total of about 50,000,000 tons. France was second at 5,000,000 tons and Belgium third at roundly 1,750,000 tons. Before the war Germany also had a long lead in the utilization of lignite, the 1913 output of lignite briquets being about 22,000,000 tons. The briquetting

industry has been relatively unimportant in the United States, though large quantities of fuel suitable for such treatment are available. Last year the American output of briquets was 880,300 tons, as against 995,000 tons in 1926. This latter record was chiefly a product of the anthracite strike, that emergency causing some thousands of consumers to turn to briquets for the first time. There is, however, some growth in their use apart from such interruptions of the regular fuel supply. The first statistical survey, made in 1907, showed a total of but 66,524 tons of briquets. By 1923 there had been nearly a ten-fold increase, or to about 700,000 tons.

INDICATIONS of two months ago that 1928 would make a new high record in steel ingot production are strengthened by the returns for September, given on another page. We have only to exceed by 1 per cent, in October, November and December, the relatively low production in the last three months of 1927. As September was 27 per cent ahead of September, 1927, and as the mills have come into October with excellent backlogs, the prospects are that the output of these three months will have a good margin over last year's final quarter. For the elapsed nine months the gain has been 9.3 per cent over 1927 and 4.25 per cent above 1926, the record year, after allowing for crucible and electric steel ingots, reported monthly in 1926 but not so reported now.

CORRESPONDENCE

Two Authors Comment on a Metallurgical Book Review

To the Editor: I have had my attention called to the review of my recent book entitled "An Introduction to the Metallurgy of Iron and Steel," which appeared on page 1826 of your issue for June 28.

I am naturally pleased with the reviewer's approval of my policy of numerous illustrations. This policy was pursued with intent and has apparently pleased many of the readers of the book also. I fear that the reviewer's examination of the book was rather casual, however, for he states that "seventeen pages are used to describe the acid open-hearth process; three are made to suffice for the basic variety." If he had examined the text more carefully he would have seen that over thirteen out of the seventeen pages which he ascribes to the acid open-hearth process consist largely of illustrations of furnaces which might apply to both processes, the remainder of the thirteen pages being text which also applies to both processes, so that the proportion is more nearly in the ratio of four pages for the acid open-hearth process to three pages for the basic open-hearth. After pointing out in the text and by means of charts the enormous tonnage of basic open-hearth produced as compared with acid I decided to discuss the acid open-hearth process first, partly because it came first historically and partly because of its importance where the highest quality of steel is to be considered. It is also true I think that the acid open-hearth process is much better standardized than the basic and a full discussion of the details of the latter process would take more space than could be devoted to it in a book of this character. I therefore contented myself with describing the chief differences between

the basic open-hearth and the acid open-hearth processes while going into some detail in regard to the acid open-hearth practice.

The reviewer also bemoans the absence of a complete exposition of the theories for the hardening of steel and accuses me of parrying the question by referring the student to Sauveur's work published in 1920 and of being unfair to Jeffries and Archer and their slip interference theory. If he will read my reference more carefully he will notice that I refer not only to Sauveur's 1920 edition but to his 1926 edition which contains a brief description, in Doctor Jeffries' own words, of the Jeffries and Archer theory. Both references were given intentionally, because the earlier theories were more fully discussed in the 1920 edition while the later edition attempts to bring the subject up to date in the customary impartial manner for which Doctor Sauveur is noted. As the reviewer indicates, however, a full discussion of the hardening theories would be very much out of place in an elementary textbook. I believe Doctor Jeffries and Mr. Archer would be the first to resent any charge of unfairness on my part and there is an implied criticism of Doctor Sauveur in the review which it would be difficult to justify.

H. M. BOYLSTON.

Cleveland, Sept. 20.

To the Editor: It is only today that I note in your issue of June 28 a review of Professor Boylston's book entitled "An Introduction to the Metallurgy of Iron and Steel." I quote as follows from the reviewer's remarks:

"Knowing the author's constant association with Professor Sauveur of Harvard University, and the latter's published views on the hardness of beta iron, the reviewer looked with interest for an exposition of the hardening theory. But alas, the question is neatly parried by referring the interested student to Sauveur's work published in 1920. This hardly seems fair to Professor Boylston's fellow townsmen, Messrs. Jeffries and Archer, who are widely credited with having proposed a very understandable

Model of Water-Cooled Boiler Furnace

AT the request of the Smithsonian Institution, Washington, the Erie City Iron Works, Erie, Pa., has built a model of its Seymour water-cooled furnace for permanent display in the institution. This has been made on a scale of 1 in. to the foot and, as shown in the illustration, has parts cut away enough so that the entire construction can be seen. It is a three-drum boiler with integral economizer and designed to be fired with powdered coal from a unit-type pulverizer

and useful theory of hardening in more recent years."

It is to be inferred from this criticism that if the reader followed the author's advice he would find in my book, "The Metallography and Heat Treatment of Iron and Steel," a description of my personal views on the hardening of steel to the exclusion, or, at least, belittling of the views held by others. This is contrary to facts. He would find that all theories that have survived are as accurately and impartially presented as it was in my power to do. He would find on pages 256 and 257, Jeffries and Archer's theory described in Doctor Jeffries' own words in a statement prepared by him as a reply to my questionnaire. I have made it a rigid rule in my writings designed to instruct students never to emphasize my own views, and I trust that I have not failed in this instance.

In referring the reader to my book, I am sure that Professor Boylston believed, and believed rightly, that in so doing he was referring to an impartial treatment of this important question and not merely to an exposition of my personal views. That is why he did not consider it necessary to deal with the subject at greater length in his own book.

ALBERT SAUVEUR.

Cambridge, Mass., Sept. 10.

Everyone who dislikes to work at a rocking bench or to eat at a jiggling table will be interested in a suggestion contained in the September issue of *Oxy-Acetylene Tips*. Legs of movable work-tables and benches may be made of pipe, the lower ends of which are threaded and fitted with an ordinary sleeve coupling or pipe cap. Such caps may then be screwed up and down to fit irregularities in the flooring, as they chance to occur.

Obscure Cause of Spalled Brick in Oil-Fired Furnaces

Bricks in a furnace or boiler setting fired with fuel oil usually fail by spalling, whereas in a similar one fired with powdered coal they fail by slagging. To discover the reason for this difference in action, the United States Bureau of Mines and the American Society of Mechanical Engineers have cooperated in a study on two large boilers.

The rate of heat liberation in the oil-fired was much higher than in the powdered-coal furnace, but the maximum temperatures of the gases observed were the same, 2800 deg. Fahr. The maximum temperatures measured were somewhat higher in the oil-fired furnace at the positions where the flame impinged on the wall. The temperature gradient plotted for the first 6 in. of the hot side of the furnace wall was no greater in the oil-fired than in the coal-fired furnace.

The rate of change in temperature when the furnaces were banked or fired up was nearly the same. The rate and frequency of change of temperature during steaming were no greater in one than in the other. There is not sufficient evidence to warrant the acceptance of change of temperature as the only cause of the greater spalling in the oil-fired furnace, and differences in some other factors may be expected.

The chemical composition of the ash of the fuels and of the slags from the walls differed materially. It is possible that some such mineral formed in combination of brick and ash from oil fuel is sensitive to thermal shock; or the mineral may have a much different thermal expansion than the brick, and spalling result from the difference in the contraction during cooling.

Schedule of the next instalments of the *Business Analysis and Forecast*, by Dr. Lewis H. Haney, Director New York University Bureau of Business Research, follows: Oct. 18—Position of Iron and Steel Producers; Nov. 1—Activity in Steel Consuming Industries.

Iron and Steel Markets

Steel Output Still Rising

October Promises to Be Peak Month in Steel Production and Shipments—Buoyancy of Demand Surprising—Scrap and Semi-Finished Steel Higher

WITH steel production rising to what promises to be a new peak, demand shows unexpected buoyancy and the price structure, from primary materials to finished products, continues to strengthen.

In steel ingot output per day, September reached the highest average since the record-breaking rate of April. In total production the month fell less than 1 per cent behind August, which had two more working days. Mill operations are still expanding, now averaging 90 per cent, if not higher, and in view of the large volume of business on mill books, October is expected to be the high month of the year in both output and shipments. That total production for 1928 will establish a new record now seems assured, since the last quarter need only exceed the relatively poor performance of the same period in 1927 by 1 per cent to effect that result.

The continued flow of new business in finished steel is impressive, following last month's heavy specifying against expiring contracts. October orders for bars, sheets, shapes and plates, though in most districts at a lessened rate, are being freely placed at the advanced prices ruling in this quarter. At Chicago, sales were particularly heavy, equaling those of any week this year, not excluding periods when bookings were swelled by large purchases of rails and track supplies.

Meanwhile pressure for deliveries has increased in proportion to the expansion in mill backlogs. In bars and sheets producers are from three to five weeks behind in shipments. A rise in sheet output to 95 per cent of capacity reflects the efforts of mills to satisfy their customers.

The outlook for a sustained rate of steel consumption is reassuring, notwithstanding the large volume of steel now being taken by the trade. The automobile industry is not producing at so rapid a pace as in September, but output for the quarter will probably exceed that for the fourth quarter of 1927 and other recent years. That no slump is in early prospect is indicated by continued efforts of motor car companies to place contracts for sheets and strip steel for the first quarter of 1929.

The farm implement industry, which is completing additions to its plant capacity, is expanding, rather than contracting, its production.

Building work taking structural steel shows no

signs of entering a period of reaction. New projects calling for nearly 82,000 tons of fabricated steel were added to the list of pending inquiries during the week. Awards totaled 33,000 tons.

Tin plate production, at 75 to 80 per cent of capacity, reflects a seasonal decline in business, and jobbing demand for wire products is disappointing, but offsetting tonnage will come from the railroads.

Inquiries for 2300 freight cars have been issued, and orders have been placed for 1500 cars to be built in railroad shops. An Eastern trunk line has closed for 46,000 tons of rails and 14,000 tons of accessories, and the Chesapeake & Ohio has bought 15,000 tons of track supplies to supplement its rail purchase of two weeks ago. The Pennsylvania will open bids Oct. 15 on 160,000 tons of rails with an option on 70 per cent more.

The strength of the price situation is emphasized by the rising trend of primary materials. Heavy steel scrap has advanced another 50c. a ton at Pittsburgh and St. Louis, while prices at Chicago and Cincinnati have gone up 75c. and \$1 a ton, respectively. A leading independent steel company may resort to duplexing to reduce its scrap requirements.

Increasing foundry melt and the expanding raw material needs of steel companies have put pig iron sellers in a strong position. Malleable and Bessemer pig iron in the Valleys have gone up 25c. a ton, and another advance at Chicago is looked for.

Billets, slabs and sheet bars are now commanding \$33 per ton, Pittsburgh or Youngstown, an advance of \$1 over the price that ruled on most third quarter contracts.

To simplify and stabilize quotations on hot-rolled strip steel, which now takes three base prices, makers have announced a new card of extras for width and gage. One base price will apply on all sizes from 1½ in. to 24 in., extras ranging from 5c. per 100 lb. upward. The new prices are 2c., Pittsburgh, and 2.10c., Chicago, but in view of the fact that nearly all buyers are covered for the remainder of the year at 1.90c., Pittsburgh, the effectiveness of the change will date from Jan. 1. Wide strips will take considerably lower net prices under the new extras.

THE IRON AGE composite prices remain unchanged, that for pig iron at \$17.84 a ton and that for finished steel at 2.362c. a lb.

Pittsburgh

Operations Gain As Ordering of Steel Increases Mill Backlogs—Heavy Melting Steel Sold at \$18

PITTSBURGH, Oct. 9.—Reports are somewhat mixed as to the amount of new business in the first full week of the final quarter of the year, but tonnages entered in most products and on most makers' books were again large. It is probable that no small part of the entries were of orders that had been received in district offices during the closing days of September and did not reach general offices until the past week. But the fact remains that bookings are of sufficient size to necessitate some enlargement of ingot production. With the Youngstown district works running at almost full physical capacity and a similar condition at Johnstown and undiminished operations in Pittsburgh and Wheeling, it is estimated that output for the combined districts is not far from 90 per cent of capacity, or substantially at the peak rate of the early part of the year.

The Carnegie Steel Co. has put on another blast furnace, and the lighting of an additional furnace at the Johnstown, Pa., works of Bethlehem Steel Co., leaves only one idle stack in a group of nine there.

Bar mills are committed for three to four weeks. Sheet mills are sold up for a slightly longer period, and a reflection of the anxiety for deliveries is to be had in the statement that sheet mill operations are at 95 per cent of capacity, or higher. Some stimulation has been given specifications for nails by the fact that some low-priced contracts expire by limita-

tion Oct. 10. The quiet spots are tin plate and welded pipe. Business in railroad track supplies is light, but betterment is expected as the roads place contracts for their 1929 rail needs.

October shows signs of being the biggest month of the year in production and shipments. These results are pretty definitely assured by the vol-

ume of business now on makers' books; the question is whether new business will be in keeping with completed orders.

Makers of semi-finished steel appear to have been successful in securing part of the advances they set out to obtain on tonnage for this quarter.

Sheet makers report little resistance to the higher prices they are asking on fourth quarter tonnages, and there is no evidence that less than 1.90c. is being done in the heavy tonnage products—plates, bars and shapes. The general undertone of the market is one of firmness, but it also is observed that mills are well supplied with orders and not in need of more to sustain economical operating schedules, while consumers are covered on the immediate requirements too fully to have occasion to add greatly to their commitments.

Another advance in heavy melting steel, which has carried it to \$18 at two or possibly three points in this district, or \$4 a ton advance from the low point of early summer, stands out among the primary materials. The recent advance in basic iron appears to have made consumers a little cautious about open inquiry in the fear

of bidding the market up on themselves.

Pig Iron.—Demand for basic iron still is strong, but the steep rise in the price a week ago has led consumers to try private negotiation as a means of securing needed supplies. No sales have come to light since those of a week ago, which embraced one lot of 2000 to 3000 tons at \$16.50, Valley furnace basis, instead of \$16 as then reported, and another of 2200 tons at \$17, Valley furnace. The market as a whole is quiet, with sales of foundry, Bessemer and malleable grades chiefly in carload lots. Basic iron is hard to obtain, as the principal production for market is by steel manufacturers, who, at this juncture, feel they are going to need all they have or will make in the next 30 or 60 days. Demand is for iron for immediate shipment. Malleable and Bessemer iron are more firmly held, and since production for market is confined to a few furnaces, makers are in a position to insist on higher prices. Small sales of these grades have been made at \$17.50, Valley furnace, and that price now appears to be as low as any to be had. The Carnegie Steel Co. has put on a Duquesne furnace and the Bethlehem Steel Co. one of its Cambria group at Johnstown, Pa. The former now has 29 of its 49 furnaces in production and eight of the nine usable furnaces at Johnstown are active.

Prices per gross ton, f.o.b. Valley furnace:

Basic	\$17.00
Bessemer	17.50
Gray forge	16.50
No. 2 foundry	17.00
No. 3 foundry	16.50
Malleable	17.50
Low phos., copper free	26.50

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Semi-Finished Steel.—Fourth quarter contract prices of billets, slabs and sheet bars are becoming more clearly defined. Several billet and slab contracts have been made at \$33 per ton, Pittsburgh, for 4 x 4-in. billets and the equivalent area of slabs. This price is a \$1 advance over the third quarter contract price, but it is also \$1 a ton under what several producers

had announced and still are quoting as the fourth quarter price. Strip makers, who take a considerable part of the commercial tonnage of billets and slabs, have been unsuccessful in getting higher prices for this quarter on strips, and therefore it has not been easy to get them interested in semi-finished steel at an advance. Most of them have sizable stocks bought at third quarter prices. Non-integrated sheet and tin plate manufacturers also seem to have been able to place considerable tonnage prior to the advance. Virtually all the makers of sheet bars have named \$33, Pittsburgh, as the final quarter contract price. Base size billets and slabs now are fairly quotable at \$33 to \$34, with the usual extra of \$1 a ton for smaller sizes. Wire rods are firm at \$42, base Pittsburgh, and there is a fairly good movement of them.

Bars, Plates and Shapes.—After the flood of tonnage releases last month, it was commonly expected that business this month would be on a smaller scale, but this has not been the case in the first week of October. New business is reported by one local office to have amounted in the past week to expectations for the entire month, while the tonnage entered by another company was more than 40 per cent in excess of that of the final week in September. It is possible that some business placed in district offices late in September did not reach general offices until the past week. In any event, mills here have a full month's obligation in bars and almost as much specified tonnage in shapes and plates. Promises of delivery on bars still are from four to five weeks. There are no suggestions of less than 1.90c., base, even to large-lot buyers, while a good many contracts have been written at 1.95c. The 2c. price still refers chiefly to very small or otherwise unattractive orders.

Rails and Track Supplies.—The Pennsylvania Railroad standard-section rail inquiry, calling for 160,000 tons plus a 70 per cent option, and for a large tonnage of track supplies, has appeared. The New York Central and Baltimore & Ohio inquiries are looked for soon. Current business in rails and

track supplies is only moderately active.

Wire Products.—Prices are firm, but with no sign of change in prices, buyers are ordering entirely in keeping with real needs. Plain wire is moving well, but this district has lost much of its former business in fence and barbed wire to mills more conveniently located in relation to consuming centers. Nail business is steady, but not active.

Tubular Goods.—Mills making seamless pipe still are well supplied with orders, and demand for that class of pipe still is reported as good. No line pipe business of account having recently been let, producers are beginning to cut into their backlogs. Welded pipe for oil well development and for building and construction work is only moderately active. Shipments of mechanical tubing exceed new buying. Mill operations do not change much, but a letdown seems probable in the last two months of the year unless there are some pipe line orders. Laying of lines is out of the question during the winter and early spring, but orders might develop during the winter.

Sheets.—Makers in this territory see no material slackening either in demand or mill engagement, but, what is probably more important to them, there is no great resistance to fourth quarter prices or the lower cash discount, which became effective Oct. 1. Considerable fourth quarter business in the common finishes has been written at 2.75c., base Pittsburgh, for black; 3.50c., base, for galvanized, and 2c., base, for blue annealed. The effectiveness of these prices is delayed somewhat by the fact that most makers have much tonnage yet to deliver at the lower third quarter prices. A desire to clean up this business, coupled with the continued insistence of buyers for deliveries, is reflected in very high mill operations. The American Sheet & Tin Plate Co. is operating at practically full physical capacity. Sheet making capacity as a whole is engaged at 95 per cent or slightly higher.

Tin Plate.—Business is in its usual

Chromium Nickel Vanadium.....	1.50	4.25
Carbon Vanadium.....	0.95	3.70

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 down to and including 2½ in. squares, the price is \$5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a \$5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

Rails

Per Gross Ton

Standard, f.o.b. mill.....	\$43.00
Light (from billets), f.o.b. mill.....	36.00
Light (from rail steel), f.o.b. mill.....	34.00
Tight (from billets), f.o.b. Ch'go mill.....	36.00

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.	

seasonal reaction, and mill operations are barely maintained at 75 to 80 per cent, with the average probably nearer the lower than the higher figure. General line tin plate is moving well and export business is of fair volume; these outlets are now the principal dependence of the mills.

Cold-Finished Steel Bars and Shafting.—The fourth quarter contract price is well established at 2.20c., base Pittsburgh, but it will be a month before it is reflected in invoice prices, as buyers generally had until the end of September to enter specifications on third quarter contracts. Shipments continue large, but most makers are able to supply demands from single turn operation of their mills.

Hot-Rolled Flats.—The first week of October has been rather light in new business, but makers are heavily supplied with orders and expect a full engagement of productive capacity throughout this month. The common expectation is that this will be a month of heavy production and shipments, but that it will fall short of last month and the month before in specifications and orders. Prices are steady. A new card of extras has been issued naming a base price and extras for all widths and gages of hot-rolled strip.

Cold-Rolled Strips.—Makers are running at a high rate and shipments are heavy, but new business moderated in the first week of the new quarter. Prices are well established at 2.75c., base, as a minimum.

Coke and Coal.—The spot furnace coke market still is very firm, but not quotably higher. More than 1000 bee-hive ovens of the H. C. Frick Coke Co. have been started up in the past fortnight, and a good-sized plant of the Hillman Coal & Coke Co. recently went into operation to take care of the needs of blast furnaces which either were being supplied with by-

product coke or recently were blown in. A local steel company still is making purchases to supplement its own by-product oven production, and this demand is largely responsible for meager supplies of spot coke. The general market still is \$2.75 per net ton at ovens. Spot foundry coke is moving well at unchanged prices. Excessive supplies of slack coal cause very low prices. The general coal market is weak with supplies quite ample for wants. A fair degree of activity and firmness is observed in household coal.

Old Material.—Heavy melting steel scrap has been sold at two points in this district at \$18 and is reported to have sold at that figure at a third. In the past week sales of this grade into consumption have been made from \$17 to \$18. Steel works operations having increased further in the past week, consumption remains high and the market also derives strength from the fact that dealers are paying well to secure tonnages they expect the mills will want. Local dealers were paying \$13 and \$13.50, f.o.b. Detroit, or \$17 to \$17.50 here before the market was fully established at \$17. It is said that this course was necessary, since an order, no matter at what price it is taken, is unprofitable unless the seller has some material

with which to start shipments. Scrap rails have been sold at \$17.50, compressed sheets up to \$17.25 and railroad specialties up to \$19.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
Heavy melting steel.....	\$17.50 to \$18.00
Scrap rails	17.00 to 17.50
Compressed sheet steel.....	17.00 to 17.25
Bundled sheets, sides and ends	15.50 to 16.00
Cast iron carwheels.....	15.25 to 15.75
Sheet bar crops, ordinary.....	17.50
Heavy breakable cast.....	12.75 to 13.25
No. 2 railroad wrought.....	17.00 to 17.50
Heavy steel axle turnings.....	15.00 to 15.50
Machine shop turnings.....	11.00 to 11.50
Acid Open-Hearth Grades:	
Railr. knuckles and couplers.....	18.50 to 19.00
Railr. coil and leaf springs.....	18.50 to 19.00
Rolled steel wheels.....	18.50 to 19.00
Low phos. billet and bloom ends	20.00 to 20.50
Low phos., mill plates.....	18.50 to 19.00
Low phos., light grade.....	17.50 to 18.00
Low phos., sheet bar crops.....	18.50 to 19.00
Hvy. steel axle turnings.....	15.00 to 15.50
Electric Furnace Grades:	
Low phos. punchings.....	17.50 to 18.00
Hvy. steel axle turnings.....	15.00 to 15.50
Blast Furnace Grades:	
Short shoveling steel turnings	12.50 to 12.75
Short mixed borings and turnings	12.50 to 12.75
Cast iron borings.....	12.50 to 12.75
No. 2 busheling.....	11.25 to 11.75

Steel car axles.....	18.50 to 19.50
No. 1 railroad wrought.....	12.50 to 13.00
Sheet bar crops.....	18.00 to 18.50
Cupola Grades:	
No. 1 cast.....	15.25 to 15.75
Rails 3 ft. and under.....	17.50 to 18.00

Railroad Equipment

Inquiries for 1300 Refrigerator and 1000 Ore Cars

LARGE inquiries reported during the week included 1000 refrigerator cars for use by the American Refrigerator Transit Co., 1000 ore cars for the Great Northern and 300 refrigerators for the Northern Refrigerator Car Co. Orders placed were largely with company shops and were featured by 1000 box cars and the rebuilding of 983 gondolas by the Pennsylvania and the rebuilding of 500 gondola cars by the Chicago, Burlington & Quincy. Locomotive inquiries included 20 for the Delaware, Lackawanna & Western and 10 for the Denver & Rio Grande Western. Details of the week's business follow;

Missouri Pacific has made inquiry for 1000 refrigerator cars for use by American Refrigerator Transit Co.

Canadian National Railways have ordered five Mountain type locomotives from Canadian Locomotive Co. These are in addition to 55 reported purchased last week.

Donner Steel Co., Buffalo, has ordered three 300-hp. oil-electric locomotives to be built jointly by Ingersoll-Rand Co., General Electric Co. and American Locomotive Co.

Swift & Co. have ordered 300 underframes from Bettendorf Co.

Delaware, Lackawanna & Western is inquiring for 20 4-8-4 type locomotives and two steel dining cars.

Chicago, Burlington & Quincy is rebuilding 500 composite gondola cars at its Galesburg, Ill., shops.

Great Northern is in the market for 1000 ore cars.

Northern Refrigerator Car Co. will buy 300 cars.

Chicago, Rock Island & Pacific is in the market for one 4-8-4 type locomotive.

Denver & Rio Grande Western will purchase 10 4-8-4 locomotives.

Pennsylvania Railroad will build 1000 steel box cars and increase the capacity of 983 gondolas from 50,000 to 70,000 lb. by substituting heavier trucks, at its Altoona, Pa., shops.

Fewer Stokers Sold

Sales of 162 mechanical stokers, with 51,572 hp., were made in August, compared with 193 with 59,859 hp. in July, according to reports received by the Department of Commerce from 11 leading manufacturers. Of the August sales 57 stokers with 7895 hp. were installed under fire-tube boilers and 105 with 43,677 hp. were installed under water-tube boilers. For the eight months ended August, 1022 stokers with 338,031 hp. were sold, against 1025 with 379,380 hp. for the corresponding period of 1927.

For transporting helium gas and other aircraft gases, the General American Tank Car Corporation is constructing a new type of car. It will be used by the aeronautical division of the Navy for shipping helium gas from the Government fields in Texas to Lakehurst, N. J., and to other dirigible ports. The conveyor weighs 200,000 lb., and has a capacity of 220,000 cu. ft. of gas.

Upset set screws.....	80, 10 and 10
Milled studs	70 and 5

Chicago

Heavier Mill Backlogs Add Strength to Steel Market— Specifications and Orders Exceed Current Output

CHICAGO, Oct. 9.—Added to the stability of the local steel market of a week ago is a decided gain in backlogs. With rails not an important factor, sales in the last seven days are fully equal to the best week of the year, not excepting periods of heavy track supply and rail buying. Specifications are unusually large, being well above output, and therefore are forcing deliveries further into the future. Heavier releases reflect not only a greater consuming demand, but also the necessity that users protect their needs against less frequent roll changes and deferred shipments. Fourth quarter contracting is in full swing and there are liberal purchases for nearby needs. Shipments of steel from Chicago mills in the first nine months of this year were 20 per cent heavier than in the corresponding period of last year, and order books are larger than a year ago.

The building industry, though slower than in the summer months, is still active and promises to take a good volume of steel throughout the fall. Several sizable rail inquiries from Western railroads are in the making. Fresh inquiries for 2300 freight cars lend encouragement to car shops. Two Western railroads, the Santa Fe and the Illinois Central, may soon come into the market for freight equipment.

Prices for plates, shapes and bars are steady at 2c. to 2.10c. per lb., Chicago.

The Inland Steel Co. has blown out No. 1 stack for relining. It will be out of service about 60 days. Twenty-three of 36 steel mill furnaces are now in blast in this district.

Pig Iron.—This market is stronger than a week ago. Prices for Northern foundry iron are firm at \$18.50 a ton, base, and the demand for prompt shipments easily keeps pace with current offerings. Rush orders are more numerous than in many years. A Chicago melter will buy 4000 to 5000 tons for delivery in October and November and a user in western Michigan will take 5000 tons for first quarter. More than 1500 tons of charcoal iron has been ordered at \$24 a ton, furnace. A cargo of Lake Erie iron has arrived at Milwaukee. The silvery market is active and prices are strong.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25..	\$18.50
N'th'n No. 1 fdy., sil. 2.25 to 2.75..	19.00
Malleable, not over 2.25 sil.....	18.50
High phosphorus.....	18.50
Lake Super. charcoal, sil. 1.50.....	27.04
So'th'n No. 2 fdy. (all rail).....	22.26
Low phos., sil. 1 to 2, copper free.....	\$28.50 to 29.00
Silvery, sil. 8 per cent.....	29.79
Bess. ferrosilicon, 14-15%.....	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—A 1500-ton cargo of 20 per cent spiegeleisen has been docked at Chicago. This was shipped from England and transferred to a Lake boat at Montreal. The bulk of this tonnage is said to be under contract. Specifications for ferromanganese are heavy.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$87.50; spiegeleisen, 19 to 21 per cent, \$40.76.

Plates.—Of special interest in this market is the fact that definite car inquiries are now before the trade. The American Refrigerator Transit Co. is asking for 1000 cars. This company is a subsidiary of the Missouri Pacific, which is expected to come into the market soon for cars for its own use. The Northern Pacific will take prices on 1000 ore cars and later may buy 500 gondolas. The Northern Refrigerator Car Co. will buy 300 refrigerator cars and the Santa Fe is a step nearer entering the market for freight equipment. Several small and scattered tank inquiries are taking shape on the Pacific Coast. Tank plate business in the mid-Continent fields is quiet. A fabricator in Beaumont, Tex., will use 1200 tons of plates, which will be shipped from Atlantic seaboard mills, for tanks to be erected in the Southwest. Specifications from pipe makers are of moderate size and not in line with recent heavy purchases of gas pipe because difficulties in obtaining franchises are delaying the start of construction programs. Miscellaneous orders for plates are numerous, and many users in the manufacturing trade have placed fourth quarter contracts at prices that range from 2c. per lb. to 2.10c., Chicago. Specifications from railroad shops, where car rebuilding operations are going on, are of fair size. The Burlington will reconstruct 500 composite gondola cars at its Galesburg, Ill., shops.

Mill prices on plates, per lb.: 2c. to 2.10c. base Chicago.

Bars.—Forward contracting in soft steel bars has mounted rapidly in the week, and specifications are fully equal to the best week so far this year. Roll changes are much less frequent, and users are finding that mill schedules do not in all cases meet their immediate requirements. Deliveries are from three to six weeks and the range of sizes that can be had in the shorter time is rapidly narrowing. Prices are firm at 2c. to 2.10c. per lb., Chicago. Agricultural implement manufacturers are operating at an unchanged rate. Schedules later in the year will be heavier because plant additions are rapidly being put to use. The iron bar market is moderately active in spot sales, but forward contracting is slow. Prices for

alloy steel bars are steady and shipments are at nearly the capacity of Chicago mills. Spot purchases are more numerous. Schedules of the automobile industry are still heavy. Rail steel bars are firm at 1.95c. per lb., Chicago Heights. Backlogs are heavy, and output continues on a double turn basis. Specifications from bed manufacturers are liberal. Shipments of reinforcing bars are unusually heavy for this time of year.

Mill prices per lb.: Soft steel bars, 2c. to 2.10c., base, Chicago; common bar iron, 2c. to 2.10c., base, Chicago; rail steel bars, 1.95c., base, Chicago Heights mill.

Bolts, Nuts and Rivets.—Total specifications are not equal to output at 65 per cent of capacity. The margin of production over shipments is being used by makers to build up stocks that have been depleted for some time. The trade expects farm implement manufacturers to take larger quantities before the end of this month.

Structural Material.—Structural awards for the week total more than 8000 tons. Foremost is 4500 tons for a building at Crystal City, Mo., for the Pittsburgh Plate Glass Co. A foundry building at Rockford, Ill., will take 1500 tons and bridges for the Chicago, Burlington & Quincy call for 1200 tons. Earlier reports were to the effect that the Bethlehem Steel Co. would fabricate near Buffalo the 38,500 tons of steel needed for the Mercantile Mart, Chicago. It now develops that the steel is being shipped to Chicago in mill lengths, a move that must be completed before the close of navigation. The work of fabricating this steel will be done in Chicago shops. This contract was taken before final plans had been completed and there may be a sizable overrun in tonnage above the preliminary estimates. Those in close touch with this contract and also the Opera Building in Chicago believe that the extra steel needed will not exceed 5000 tons on each of the two jobs. The Starrett's Building Co. has been awarded the general contract for the 75-story Chicago Tower and Apparel Mart. This structure will make use of air rights, and, according to preliminary estimates, will require 75,000 tons of structural steel and 12,000 tons of reinforcing bars. Several projects in Milwaukee are taking more definite shape. In fact, the outlook in that city is favorable for early action on several sizable structures. Shops to the west of the Mississippi River are in need of orders.

Mill prices on plain material, per lb.: 2c. to 2.10c. base, Chicago.

Rails and Track Supplies.—A railroad operating east from Chicago has closed for 46,000 tons of standard-section rails. About 14,000 tons of accessories will go with this order. The 12,000 to 15,000 tons of track supplies needed by the Chesapeake & Ohio are now said to have been placed in the East. The Pennsylvania is asking for 272,000 tons of rails as a maximum. Last year this railroad ordered 200,000 tons and took an option on 100,000 additional, and exer-

cised the option in part. The Chicago, Milwaukee, St. Paul & Pacific and the Burlington are actively engaged in preparing 1929 rail programs. It is said that the Santa Fe will soon be in the market for about 75,000 tons. Rail mill output remains at 50 per cent of capacity. Production of track accessories has varied little in the last 60 days and is heavier in proportion to rail shipments than is normally expected at this time of the year. Miscellaneous orders for iron tie plates total 300 tons. Inquiries are in the market for 1000 tons.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Reinforcing Bars.—Inquiry and awards are active. Two weeks ago this market had all the appearances of having passed into a fall slump. Since that time, however, contracts have been more than heavy enough to support shop operations, and the volume of fresh inquiry is making the near future appear much brighter. Then, too, there is greater activity among architects and engineers, and estimators have more work at hand than in a number of weeks. The total volume of bars sold so far this year, both in Chicago and in the country as a whole, exceeds by a comfortable margin purchases in the first nine months of 1927. But in all directions, as in Chicago, prices are sagging and dealers do not appear to be able to strengthen their position at this time when mills are asking higher prices for fourth quarter contracts. The lightening of bar deliveries by producers is causing some inconvenience at bending shops. New contracts and recent inquiries are given on page 925.

Old Material.—The Chicago scrap market continues to gain strength, and quotations for the most part are higher than a week ago. Users are resisting price advances and therefore have not built stocks. With the high rate of activity, they are forced to

come into the market at frequent intervals. This policy makes for urgent calls for prompt delivery, which is becoming increasingly difficult because many cars that have been used in the scrap trade are being diverted to the coal fields. More than 15,000 tons of heavy melting steel has been purchased by a local steel mill at \$14.50 a gross ton, delivered. Prices paid to railroads are high. The Chicago & North Western received the equivalent of \$14.75 a gross ton, delivered, for heavy melting steel.

Prices deliv'd Chicago district consumers:

Per Gross Ton	
Basic Open-Hearth Grades:	
Heavy melting steel.....	\$14.00 to \$14.50
Shoveling steel.....	13.75 to 14.25
Frogs, switches and guards, cut apart, and misc. rails	15.50 to 16.00
Hydraulic compressed sheets	12.50 to 13.00
Drop forge flashings.....	9.50 to 10.00
Forg'd, cast and r'l'd steel carwheels	17.25 to 17.75
Railr'd tires, charg. box size	17.25 to 17.75
Railr'd leaf spring cut apart	17.25 to 17.75
Acid Open-Hearth Grades:	
Steel couplers and knuckles	15.75 to 16.25
Coil springs.....	18.25 to 18.75
Electric Furnace Grades:	
Axle turnings.....	13.50 to 14.00
Low phos. punchings.....	15.50 to 16.00
Low phos. plate, 12 in. and under.....	15.50 to 16.00
Blast Furnace Grades:	
Axle turnings.....	11.00 to 11.50
Cast iron borings.....	10.50 to 11.00
Short shoveling turnings..	10.50 to 11.00
Machine shop turnings....	6.75 to 7.25
Rolling Mill Grades:	
Iron rails.....	14.75 to 15.25
Rerolling rails.....	16.50 to 17.00
Cupola Grades:	
Steel rails less than 3 ft..	17.25 to 17.75
Angle bars, steel.....	16.50 to 17.00
Cast iron carwheels.....	13.75 to 14.00
Malleable Grades:	
Railroad	15.25 to 15.75
Agricultural	12.50 to 13.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heav.	26.00 to 31.00

Per Net Ton

Rolling Mill Grades:	
Iron angles and splice bars	14.50 to 15.00
Iron arch bars and transoms	20.50 to 21.00
Iron car axles.....	25.50 to 26.00
Steel car axles.....	16.25 to 16.75
No. 1 railroad wrought...	12.75 to 13.25
No. 2 railroad wrought...	12.50 to 13.00
No. 1 busheling.....	10.25 to 10.75
No. 2 busheling.....	6.00 to 6.50
Locomotive tires, smooth..	13.00 to 13.50
Pipes and flues.....	9.00 to 9.50
Cupola Grades:	
No. 1 machinery cast.....	15.50 to 16.00
No. 1 railroad cast.....	14.50 to 15.00
No. 1 agricultural cast....	13.75 to 14.25
Stove plate	11.50 to 12.00
Grate bars.....	12.25 to 12.75
Brake shoes	11.50 to 12.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Wire Products.—Producers of wire products frankly admit that the fall jobbing trade is a disappointment. Some fair-sized contracts have been placed by distributors, but specifications are not in keeping with what had been expected. Jobbers are finding only a small outlet for nails, this being equally true in the country and in the cities. Nail output is not over 25 per cent of capacity. Woven wire fencing

is moving slowly, not having gained a volume that sellers believed should come with generally good conditions in agricultural districts. A bright spot in this market is the consistent and heavy demand from the manufacturing trade. Contract buyers are well covered for this quarter, and spot buying is of sizable proportions. Prices are steady. Mill stocks are no longer growing and output at 65 per cent of capacity closely represents the actual consumption of wire and wire products.

Cast Iron Pipe.—This market is unusually quiet. Chicago will buy 200 tons of 3-in. to 24-in. fittings. Producers are naming \$36 to \$37, Birmingham, for 6-in. and larger diameter pipe, but tests have not been afforded here.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, \$42.20 to \$43.20; 4-in., \$46.20 to \$47.20; Class A and gas pipe, \$4 extra.

Sheets.—Volume of sales is up and prices are strong. Specifications are liberal. Output is steady at 85 per cent of hot-mill capacity. New purchases now being made are for the most part for delivery in November and December. Releases by road machinery builders are heavier, and agricultural machinery manufacturers are planning larger schedules for early winter manufacture. Movement of sheets out of warehouses is growing slowly. Mill deliveries of all grades range from three to four weeks.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.80c. to 2.90c.; No. 24 galv., 3.65c. to 3.75c.; No. 10 blue ann'd, 2.15c. to 2.25c. Deliv'd prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Coke.—Two new batteries, each of 37 coke ovens, have been lighted at the Iroquois furnaces. The daily capacity of these new units is 1100 tons. Shipments of by-product foundry coke are heavy and prices are firm.

Large Airship Hangar to Be Built at Akron

An airship hangar, which, it is stated, will be the largest in the world, will be erected by the Goodyear-Zeppelin Corporation, Akron, Ohio, a subsidiary of the Goodyear Tire & Rubber Co. Two dirigibles for which the Navy Department has awarded the Akron company a contract will be built in this hangar, and it is stated that the plant will also be used for the erection of commercial airships. The hangar will be 1200 ft. long, 360 ft. wide and 200 ft. high, and its cost is estimated at from \$2,000,000 to \$3,000,000. It will be large enough to hold at one time two airships of the size that will be built for the Navy. Equipment will be installed for fabricating the frames for the dirigibles. While the location of the plant has not been definitely announced, a site will probably be selected in Akron.

Philadelphia

Pennsylvania Asks for Annual Rail Tonnage—Steel Contracting Fairly Heavy—Basic Iron Inquired For

PHILADELPHIA, Oct. 9.—Bids will be opened Oct. 15 on the rail requirements of the Pennsylvania Railroad for next year, 160,000 tons, with an option on 70 per cent more. In 1927, about 200,000 tons was bought, with an option on 50 per cent additional, but only half of the latter was taken up during the year.

Steel contracting has been larger than in any previous quarter of the year, and most mills report September as among the record months. Sheet mills are well filled and bar mills have in some cases closed rolling schedules to the end of this month. Prices are firm. Last quarter contracts are still being made for bars and plates at a \$2 a ton advance to the consumer, or at 1.90c. to 2c., Pittsburgh, on bars and 2.05c. to 2.15c., Coatesville, on plates.

Pig Iron.—A large consumer of basic, which recently closed on a sizable tonnage for last quarter delivery, is in the market for more iron and will probably buy this week. Sellers are of the opinion that the purchase price will establish an advance in the basic market of about 50c. a ton. Foundry iron is inactive, but prices are firm at \$20, base furnace. Consumers are pressing for prompt shipments on their contracts and interest in first quarter requirements is developing, although no definite inquiries are reported. Low phosphorus demand is fair and the price is unchanged.

Prices per gross ton at Philadelphia:		
East. Pa. No. 2, 1.75 to		
2.25 sil.		\$20.76
East. Pa. No. 2X, 2.25 to		
2.75 sil.		21.26
East. Pa. No. 1X		21.76
Basic (del'd east. Pa.)	\$19.00 to	19.25
Gray forge	19.75 to	20.25
Malleable	21.00 to	21.50
Stand. low phos. (f.o.b.		
N. Y. State furnace)	22.00 to	23.00
Cop. b'rg low phos. (f.o.b.		
furnace)	23.00 to	23.50
Va. No. 2 plain, 1.75 to		
2.25 sil.		24.54
Va. No. 2X, 2.25 to 2.75 sil.		25.04

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to \$1.64 from eastern Pennsylvania furnaces; \$4.54 from Virginia furnaces.

Bars.—Mills are heavily booked and deliveries have lengthened to two to three weeks on some sizes to five and six weeks on others. Contracts are still being made for this quarter at 1.90c. to 1.95c., Pittsburgh, or 2.22c. to 2.27c., Philadelphia. On small lots 2c., Pittsburgh, or 2.32c., Philadelphia, is usually obtained.

Shapes.—Fabricating shops are well engaged and are quoting on a sizable tonnage of new projects, including 16,000 to 18,000 tons for the Reading Commercial Building at Broad and Callowhill Streets. Low priced contracts on shapes have been fairly well completed, and mills are now asking a minimum of 2.05c., Pencoyd, or 2.11c., Philadelphia, on new business. Contracting has been in fair volume, but not so large as in plates and bars.

Plates.—Contracting has been large, and prices are firm at 2.05c. to 2.15c. per lb., Coatesville, or 2.15c. to 2.25c., delivered Philadelphia. Deliveries on third quarter contracts continue in a few cases. Local shipyards are bidding on a number of shipbuilding contracts, but no awards are reported.

Sheets.—Specifications on mill books are sufficient in some instances to require full operation for eight to nine weeks. Blue annealed sheets are firm at 2c. to 2.10c., Pittsburgh, or 2.32c. to 2.42c., Philadelphia, although some large users claim to be able to buy the continuous mill product at 1.90c. per lb., Pittsburgh. Black sheets are 2.75c., Pittsburgh, or 3.07c., Philadelphia, and galvanized 3.50c., Pittsburgh, or 3.82c., Philadelphia. Contracting for all grades of sheets has been heavy. Most consumers are asking for prompt deliveries.

Warehouse Business.—Effective Oct. 8, jobbers have advanced plates, shapes, bars, hoops and bands \$2 a ton. The quotation on blue annealed sheets has been revised from 3.15c. per lb., base, to 3c., and the quantity differential on plates, shapes, bars, hoops and bands has been applied on orders of one ton or more of a size.

Imports.—In the week ended Oct. 6, 4507 tons of pig iron and 35 tons of ferromanganese arrived at this port from the United Kingdom. Ore imports were 1000 tons of chrome ore from India. Steel arrivals were as follows: From France, 1010 tons of iron skelp, 112 tons of structural shapes, 12 tons of strip steel and 242 tons of steel billets; from Germany, 24 tons of steel scrap and 26 tons of steel sheets; from the United King-

dom, 15 tons of strip steel; from Sweden, 27 tons of steel billets and 31 tons of steel bars, and from Belgium, 12 tons of steel bars and 369 tons of shapes.

Old Material.—A good tonnage of scrap is moving to eastern Pennsylvania consumers, but no new buying of consequence is reported. A broker, as buying agent for a Phoenixville consumer, is paying \$11.50 per ton, delivered, for machine shop turnings. A leading steel company may resort to duplexing operations to save scrap, which the company considers too high at the present level. The list of scrap offered last week by the Pennsylvania Railroad is understood to have brought out a bid of \$17.70 per ton, delivered Vandergrift, Pa., for the heavy melting steel.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel.	\$16.00
Scrap T rails	\$15.50 to 16.00
No. 2 heavy melting steel.	13.00 to 13.50
No. 1 railroad wrought.	15.50 to 16.00
Bundled sheets (for steel works)	11.00 to 11.50
Machine shop turnings (for steel works)	11.50
Heavy axle turnings (or equiv.)	12.50 to 13.50
Cast borings (for steel works and roll. mill)	11.00 to 11.50
Heavy breakable cast (for steel works)	16.50 to 17.00
Railroad grate bars	12.50 to 13.00
Stove plate (for steel works)	12.50 to 13.00
No. 1 low phos., hvy., 0.04% and under	19.00 to 20.00
Couplers and knuckles	17.00 to 17.50
Rolled steel wheels	17.00 to 17.50
No. 1 blast f'nace scrap	10.00 to 10.50
Wrot. iron and soft steel pipes and tubes (new specific.)	14.50 to 15.00
Shafting	19.00 to 20.00
Steel axles	22.00 to 23.00
No. 1 forge fire	12.00 to 12.50
Cast iron carwheels	16.50 to 17.00
No. 1 cast	17.00 to 17.50
Cast borings (for chem. plant)	14.50 to 15.00
Steel rails for rolling	15.50 to 16.00

Dover Furnace Remains in Hanna Control

An impression that the Dover furnace, Dover, Ohio, of the Hanna Furnace Co., Cleveland, was under lease to the Shenango Furnace Co., Pittsburgh, is corrected in an announcement just made by the Hanna company, to the effect that the furnace again is in its control. This furnace furnished hot metal to the Penn Mold & Mfg. Co., and when that company was acquired by the Shenango company there were reports that the furnace had been leased as part of the transaction. Early plans called for the operation of the Dover ingot mold plant and a lease of the blast furnace was drawn up, but it was not executed, as the Shenango company soon decided to concentrate the manufacture of molds at its own plant at Filler for Foreign Markets Sharpsville, Pa.

The Hanna Furnace Co. is installing a Steinbart washer at its No. 4 Susquehanna furnace, Buffalo. This is the third installation in this group of furnaces of this type washer, which is built by the Riter-Conley Co., Pittsburgh.

New York

Pig Iron Market Stronger—Steel Sales Reflect Firmness of Fourth Quarter Prices

NEW YORK, Oct. 8.—The pig iron market has a strong tone. Despite the liberal contracting for this quarter, a good volume of new business, mainly in relatively small lots for early shipment, develops from week to week. Sales in the past seven days totaled nearly 10,000 tons. In some instances slow deliveries against previous orders have resulted in the payment of premiums for prompt material. Barge shipments from Buffalo, however, have increased sharply, and on most current business the ruling price on foundry iron is \$17, base Buffalo. Delivered prices at New Jersey tidewater points have stiffened, evidently reflecting higher barge rates. The present market range is \$20.01 to \$21.25, delivered, for No. 2 plain, which is an advance of 50c. a ton in the minimum price over quotations recently current and an increase of \$1 a ton over the mid-summer low on barge iron. Little interest has yet been shown in first quarter pig iron, and producers, looking for further increases in prices, are not pressing for contracts even at the recently announced advance of 50c. a ton on Buffalo material. Prices on foreign iron are again competitive with those on the domestic product. Dutch No. 1X foundry is still offered at \$21, duty paid, port of entry, although \$21.25 will be asked on first quarter business. An advance of about \$1.25 a ton in ocean freight rates on pig iron from India, effective Jan. 1, will not affect deliveries from that country before March. The largest current inquiry is for 500 tons wanted by the American Locomotive Co. for its Dunkirk, N. Y., plant.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil.	1.75	
to 2.25.....		\$21.91
*Buf. No. 2, del'd east.		
N. J.		20.28
No. 2, del'd east. N. J.		
tidewater	\$20.01 to	21.25
East. Pa. No. 2 fdy., sil.		
1.75 to 2.25.....	20.89 to	22.02
East. Pa. No. 2X fdy., sil.		
2.25 to 2.75.....	21.39 to	22.52
East. Pa. No. 1X fdy., sil.		
2.75 to 3.25.....	21.89 to	23.02

Freight rates: \$4.91 from Buffalo, \$1.39 to \$2.52 from eastern Pennsylvania.

*Price delivered to New Jersey cities having rate of \$3.28 a ton from Buffalo.

Plates, Shapes and Bars.—Considering the heavy specifications received by mills in the latter part of September, the volume of business so far this month, though at a lessened rate, is surprisingly good. This applies particularly to bars, but plates and shapes are also in steady demand. In bars and shapes, mill schedules are well rounded out, with the result that early deliveries are not easy to get unless a buyer happens to catch a current rolling of a size wanted. The price situation for the quarter is now well defined. Large buyers of bars have been covered at 1.90c., Pittsburgh, while the inter-

mediate class of consumers and jobbers are paying 1.95c. The number of contracts at the latter figure is large. Only the smallest buyers are being asked to pay 2c., but single carloads have been sold at this price.

*No. 28 and lighter, 36 in. wide, 20c. higher per 100 lb.

The larger users of plates and shapes have been covered at 2.22½c., New York, for plates and at 2.19½c., New York, for shapes, with \$1 higher for the intermediate class of buyers and \$2 up, or 2.32½c., for small lots. On 150 tons of plates, a buyer had two quotations of 2.22½c. and some at 2.27½c., New York. Structural steel business in New York promises to continue at a brisk rate. The inquiry is out for 26,500 tons for the Kill van Kull bridge connecting Staten Island to New Jersey, and bids will be taken up to Oct. 16 on 6700 tons for another section of the New York subway system. Lettings included 3400 tons for a Y. M. C. A. building and 2800 tons for a Salvation Army building. The Structural Steel Board of Trade of New York reports total bookings by its members in September of 39,000 tons, exclusive of subways and similar work, compared with 43,000 tons in August and 26,000 tons in September, 1927.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.24c. to 2.34c.; plates, 2.22½c. to 2.32½c.; struc. shapes, 2.19½c. to 2.22½c.; bar iron, 2.14c.

Sheets.—Fourth quarter contracting for sheets has been much more liberal than was expected, in view of the large specifications received by the mills last month. Spot sales and contract coverage have been at 2.75c., Pittsburgh, for black, 3.50c. for galvanized and 2c. for blue annealed in widths under 45 in. and at 2.10c. for widths exceeding 45 in.

Reinforcing Steel.—A considerable tonnage is involved in jobs placed the past week, the largest having been a building for Montgomery Ward & Co. at Albany, N. Y., which took 2000 tons, and foundation work on the Kill van Kull bridge, amounting to 500 tons. The general contract for all four sections of the water tunnel extending under Manhattan from Yonkers to Brooklyn has been let to Patrick McGovern, Inc. The job will take 2850 tons of bars. A terminal warehouse for the Delaware, Lackawanna & Western Railroad Co. at Jersey City will require 2000 tons. Business placed has not yet provided a test for the \$2 advance in prices which was made effective Oct. 1.

Warehouse Business.—Jobbers report increased activity among small consumers, and in a few instances large users are buying material from warehouse, probably because of the extended mill deliveries. Demand for structural steel is good, and orders are increasing in size.

Cast Iron Pipe.—Northern and Southern makers of pressure pipe report a steady flow of small orders ranging from a few tons to a carload, but no sizable business is in the market. Prices continue at \$36 and \$37 base, Birmingham, the quotation of Southern foundries, and \$35.60 to \$36.60 per net ton, delivered New York, quoted by Northern makers.

Prices per net ton, deliv'd New York: Water pipe, 6-in. and larger, \$35.60 to \$36.60; 4-in. and 5-in., \$40.60 to \$41.60; 3-in., \$50.60 to \$51.60; Class A and gas pipe, \$4 to \$5 extra.

Coke.—Connellsville quotations on standard furnace coke range from \$2.85 to \$3 per ton and slight advances on these prices are usually asked when delivery over the remainder of the year is specified. This firmness is not reflected in the foundry coke market, however, and standard foundry continues at \$3.50 to \$3.75 per net ton, Connellsville. Standard brands are unchanged at \$4.85 per net ton, ovens, or \$8.56 per ton, delivered to northern New Jersey, Jersey City and Newark and \$9.44 per ton, to New York and Brooklyn. By-product coke operators are heavily booked with contract tonnage, and deliveries are in some cases delayed. Foundry grade is unchanged at \$9 to \$9.40, Newark or Jersey City, and \$10.06, New York or Brooklyn.

Old Material.—Buying prices show an advance on most grades of scrap. No. 1 heavy melting steel is being bought by brokers at \$15.50 per ton, delivered to a consumer at Coatesville, Pa., and some brokers are paying \$15.75 per ton, delivered Claymont, Del., to fill a \$16 order. The heavy melting steel on the Pennsylvania Railroad list, opened last week, is reported to have brought \$17.85 per gross ton, delivered Steubenville, Ohio, and \$17.70 per ton, Vandergrift, Pa.

Forge fire shows a decided advance in price, with brokers paying \$12 and a few paying \$12.50 per ton, delivered eastern Pennsylvania, to cover a recent \$12.50 per ton order. Yard grade of heavy melting steel is being bought at \$12.50 to \$13 per ton, delivered, shipments going to consumers at Harrisburg, Phoenixville, Pottsville and Conshohocken, Pa.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	\$11.50 to \$12.00
Heavy melting steel (yard)	8.75 to 9.50
No. 1 hvy. breakable cast.	12.75 to 13.50
Stove plate (steel works)	8.75 to 9.00
Locomotive grate bars	9.25 to 10.25
Machine shop turnings	7.50 to 8.00
Short shoveling turnings	7.50 to 8.00
Cast borings (blast furn. or steel works)	6.50 to 7.50
Mixed borings and turnings	6.75 to 7.25
Steel car axles	18.00 to 18.50
Iron car axles	25.25 to 26.25
Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.75
Forge fire	8.25 to 9.00
No. 1 railroad wrought	11.75 to 12.25
No. 1 yard wrot., long	10.75 to 11.25
Rails for rolling	11.50 to 12.00
Cast iron carwheels	13.00 to 13.50
Stove plate (foundry)	9.50 to 10.00
Malleable cast (railroad)	10.00
Cast borings (chemical)	11.25

Prices per gross ton, deliv'd local foundries:

No. 1 machy. cast	\$16.50 to \$17.00
No. 1 hvy. cast (columns, bldg. materials, etc.)	
cupola size	14.50 to 15.00
No. 2 cast (radiators, cast boilers, etc.)	14.00 to 14.50

quarter. The Cleveland Union Terminals Co. is expected to have an inquiry out shortly for 20,000 tons of structural material for bridge work in connection with new tracks.

Pig Iron.—Foundry and malleable iron has been sold for first quarter shipment from Toledo and Detroit to central and western Ohio and Michigan at the ruling fourth quarter quotations. Cleveland furnaces have not opened their books for that period and are adhering to their quotations of \$17.50 for foundry and malleable iron for outside shipment for the remainder of the year. An \$18 price will probably be named for the first quarter in Indiana, although no sales are reported in that State. Sales by Cleveland interests during the week totaled 32,000 tons, largely in last quarter business. A Muncie, Ind., malleable foundry is inquiring for 6000 tons for the first quarter, a Dayton, Ohio, foundry for 2000 tons of foundry iron and a Hamilton, Ohio, foundry for 1500 tons of foundry iron. The shortage of basic iron continues and the market is firm at \$17. A Canton, Ohio, consumer which inquired for 15,000 tons has taken care of its immediate needs by the purchase of about 4000 tons at \$17, Valley, and another Ohio consumer has bought a small tonnage from a Lake furnace at a price that figures slightly above \$17. An attempt was made to increase the production of basic iron by shipping basic ore to a furnace having only foundry ore, but the plan was abandoned.

Prices per gross ton at Cleveland:

N't'n'n fdy., sil.	1.75 to 2.25	\$18.50
S't'h'n fdy., sil.	1.75 to 2.25	22.25
Malleable		18.50
Ohio silvery, 8 per cent.		28.00
Basic Valley furnace		17.00
Stand. low phos., V'ley fur.	\$26.50 to	27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Sheets.—Business is coming out in good volume at the new prices, which appear to be firmly maintained at 2.75c., Pittsburgh, for black, 2c. for blue annealed and 3.50c. for galvanized. Little is heard now of an Ohio mill base, which became quite general when the market was weak. Mills are getting a good volume of orders, but consumers see no advantage in placing fourth quarter contracts, and, as a rule, are buying only for their early requirements. Mills are well filled and some are turning away business, particularly in auto body sheets, because they cannot make the desired deliveries. A large tonnage of auto body sheets will be purchased shortly for the new Chevrolet models.

Warehouse Business.—While some price shading is reported on galvanized and black sheets, these are holding fairly well at the recent \$2 a ton advance. Business shows an improvement in that orders, while not more numerous, are for larger tonnages than recently.

Semi-Finished Steel.—Prices appear to have been definitely established at \$33, Pittsburgh and Youngstown, for

Cleveland

Steel Business This Month Exceeding Expectations in View of Recent Heavy Buying

CLEVELAND, Oct. 9.—A good volume of orders for steel bars and structural shapes came out during the week at the new prices. Business exceeded expectations, in view of the heavy volume of specifications on expiring contracts up to the end of September. Plates also are moving fairly well. The fact that no lull developed early this month while shipments on old contracts were being used up indicates that steel is going into production and that consumers are not accumulating stocks. Consumers are accepting the new prices on steel bars, plates and structural material, and most of the buyers have signed fourth quarter contracts.

Most contracts taken by outside mills are at 1.95c., Pittsburgh, for steel bars, plates and shapes. A very few of the larger buyers are allowed the 1.90c. price, but buyers of small miscellaneous lots are paying 2c. The outside mill price on steel bars, when Cleveland is used as a basing point, is 1.95c. to 2.05c., Cleveland. The local steel bar market shows a firmer tone, with 1.90c., Cleveland, the commonly quoted price.

Some of the automobile companies are continuing their efforts to place sheets and strip steel for the first quarter, but mills are declining to go beyond the end of the year. While the automotive industry is not operating at the rate of a month ago, specifications from that industry are good, and it is expected that the output of motor cars during the last quarter will exceed those of the like period in the past few years.

To simplify the price situation and stabilize the market on hot-rolled strip, makers have issued a new card of extras naming one base price for all widths of material and covering strip up to 24-in. While it is expected that this card will be generally adopted, the new extras will not generally apply before January, as most consumers are under contract

for the remainder of the year at the old prices.

Structural inquiry is coming out in fair volume, and fabricators are quoting higher prices than during the last

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and struct. shapes	3.00c.
Soft steel bars	3.00c.
Reinforc. steel bars	2.25c. to 2.50c.
Cold-fin. rounds and hex.	3.65c.
Cold-fin. flats and sq.	4.15c.
Hoops and bands	3.65c.
Cold-finished strip	*5.95c.
Black sheets (No. 24)	3.50c.
Galvanized sheets (No. 24)	4.25c.
Blue ann'd sheets (No. 10)	3.35c.
No. 9 ann'd wire, per 100 lb.	\$2.85
No. 9 gal. wire, per 100 lb.	3.30
Com. wire nails, base per keg	2.85

*Net base, including boxing and cutting to length.

sheet bars, large billets and slabs for the last quarter, and a Cleveland mill announces that it closed during the week with most of its consumers on that basis. This was the open quotation in this market during the last quarter, although some consumers were able to get a \$32 price. Some effort has been made recently to get the price on large billets and slabs up to \$34.

Cold-Finished Steel Bars.—Most consumers have accepted the \$2 a ton advance to 2.25c., Cleveland, for the fourth quarter. There is somewhat of a lull in the demand following heavy specifications against expiring third quarter contracts.

Cold-Rolled Strip.—The demand has increased considerably, due to orders from the automotive industry for material for new models. The market is firm at regular quotations.

Reinforcing Bars.—Business shows a gain, and prices are somewhat better, although irregularities have not disappeared. Awards during the week included two local jobs totaling nearly 1000 tons.

Iron Ore.—The demand for small lots of ore to round out mixtures is more active than usual at this time of the year. One of 40,000 tons and several smaller lots were sold during the week. The market is firm at regular prices.

Fluorspar.—Some of the mills having contracts for minimum and maximum quantities have increased their specifications. There is very little current business, but the market is firm at \$17, mines, for gravel fluor-spar.

Bolts and Nuts.—The demand is slightly less than last month, owing in part at least to some slowing down in orders from the automotive industry. Most buyers have placed fourth quarter contracts at the regular discounts.

Coke.—A moderate amount of activity is reported in foundry coke for prompt shipment. The ruling price for good Connellsville coke is \$4, ovens. Ohio by-product coke is quoted at \$7.75, Painesville.

Hot-Rolled Strip Steel.—A new card of extras on hot-rolled strip was issued by some of the mills Oct. 6, and it is expected that the new extras will be generally adopted. The new card has one base price for all hot-rolled strip from 1½-in. to 24-in. wide, extras being provided to cover all widths and gages. An attempt is being made in this price card to simplify the price structure on hot-rolled strip, to bring about a standard basis of quoting, and to stabilize prices. The market in these respects has been in a demoralized situation for some time. The new base prices are 2c., Pittsburgh, and 2.10c., Chicago, but for the present, at least, mills will quote a \$2 a ton lower price or a 1.90c., Pittsburgh base, except possibly for small lots. Under the new card there is no gage or width of material that carries the base price, the smallest differential being 5c.

per 100 lb. on the heaviest gage wide material. Prices under the new card on most sizes will be higher than present quotations. The most important changes are made on wide sizes. These formerly carried large extras which were entirely out of line, considering the present day costs of rolling the wide material compared with narrow strip. For example, No. 16 gage strip, 15-in. wide, under the old card carried a \$1.15 differential, while under the new card the differential is only 30c. Carbon, quantity and cutting extras are unchanged.

Old Material.—Prices continue to move upward and the market is firm at the new levels. With an active demand for scrap for shipment to the Youngstown and Pittsburgh districts, most of the steel making grades advanced 50c. a ton during the week. Dealers are paying \$16 for No. 1 heavy melting steel and for compressed sheet steel for Youngstown shipment and \$17 for the former for Weirton. No. 1 heavy melting steel has been sold for delivery to a local mill at \$14.25 and the supply is not plentiful at that price. One Cleveland mill would buy scrap at present, but is unwilling to pay the dealers' ask-

ing price of \$15 to \$15.50 for heavy melting steel. It is stated that the only Detroit scrap coming to Cleveland by water at present is some purchased a few months ago, when prices were considerably lower.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades		
No. 1 heavy melting steel.	\$14.00 to	\$14.50
No. 2 heavy melting steel.	13.25 to	13.50

Reinforcing Steel

Awards of 9400 Tons—2000 Tons for Mail Order Warehouse

AWARDS of reinforcing bars reported to THE IRON AGE in the last week amounted to more than 9400 tons and included 2000 tons for a mail order company warehouse at Albany, N. Y., and 1000 tons for miscellaneous work in Chicago. New projects totaled only 3400 tons, 2000 tons of which will be required for a railroad terminal warehouse at Jersey City. Awards follow:

NEW YORK, 500 tons, foundation work for Kill Van Kull bridge; from Converse Construction Co., general contractor, to Jones & Laughlin Steel Corporation.

BROOKLYN, 300 tons, soap factory for I. Rokeach & Sons, to Jones & Laughlin Steel Corporation.

NEW YORK, 100 tons, Brearley School, Inc., in East Eighty-third Street, to Jones & Laughlin Steel Corporation.

ALBANY, N. Y., 2000 tons, building for Montgomery Ward & Co., to Kalman Steel Co.

AUBURN, N. Y., 300 tons, addition to Auburn Prison, to a Buffalo maker.

LANSING, MICH., 500 tons, Logan Street viaduct, to Capitol Steel Corporation.

AKRON, OHIO, 150 tons, building for Good-year Tire & Rubber Co., to Pattison-Leitch Co.

CLEVELAND, 500 tons, warehouse for Northern Ohio Products Co., to Bourne-Fuller Co.

CLEVELAND, 450 tons, W. S. Tyler Co., to Bourne-Fuller Co.

ALCORN, MISS., 100 tons, administration building and girls' dormitory for Agricultural and Mechanical College, to Laclede Steel Co.

CHICAGO, 100 tons of rail steel bars, apartment building at 2816 East Seventy-sixth Street, to Barton Spiderweb Co., Inc.

CHICAGO, 1000 tons, miscellaneous work placed by William G. McNulty & Brothers, contractors, to unnamed bidders.

CHICAGO, 250 tons of rail steel bars, apartment hotel, to Inland Steel Co.

CHICAGO, 100 tons, placed by Gamm Construction Co. with Concrete Engineering Co.

STATE OF ILLINOIS, 150 tons of rail steel bars, road work, to Calumet Steel Co.

FORT LEWIS, WASH., 550 tons, Government buildings, to Pacific Coast Co.

LOS ANGELES, 225 tons, apartment building at Second and Alexandria Streets, to unnamed interest.

SAN FRANCISCO, 100 tons, warehouse, Third and Brannan Streets, to Gunn, Carle Co.

SAN FRANCISCO, 900 tons, office building, 450 Sutter Street, to Gunn, Carle Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

EASTHAMPTON, MASS., 275 tons, State bridge.

CAMBRIDGE, MASS., 100 tons, engine testing unit for Massachusetts Institute of Technology.

NEW YORK, 2850 tons, tunnel for New York Board of Water Supply; Patrick McGovern, Inc., general contractor.

JERSEY CITY, 2000 tons, terminal warehouse for Delaware, Lackawanna & Western Railroad.

CLEVELAND, 150 tons, addition to Cleveland Clinic.

MINNEAPOLIS, 500 tons, warehouse; Wells Brothers Construction Co., Chicago, general contractors.

SACRAMENTO, CAL., 350 tons, paving in Ventura County; bids Oct. 24.

SEATTLE, 110 tons, hospital, Summit Street; bids being taken.

SEATTLE, 100 tons, Ballard Church; bids being taken.

Pacific Coast

Oil Tanks Awarded Take 1600 Tons of Plates—2100 Tons in Structural Lettings

SAN FRANCISCO, Oct. 6 (*By Air Mail*).—Important developments in the iron and steel markets on the Pacific Coast this week were lacking. Included among the inquiries were 1266 tons of cast iron pipe for Los Angeles and 1284 tons of cast iron or riveted steel pipe for Seattle.

Pig Iron.—Sales and inquiries for foundry pig iron involved relatively unimportant tonnages for prompt shipment. A slight improvement in the rate of operations among jobbing foundries is reported, but most consumers have sufficient stocks on hand to take care of present requirements. Prices remain unchanged.

Prices per gross ton at San Francisco:

*Utah basic.....	\$25.00 to \$26.00
*Utah fdy., sil. 2.75 to 3.25.....	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25.....	24.00 to 25.00

*Delivered San Francisco.

**Duty paid, f.o.b. cars San Francisco.

Bars.—Included among the awards of reinforcing steel bars this week were 900 tons for an office building and 100 tons for a warehouse in San Francisco, both taken by Gunn, Carle & Co. An unnamed interest was awarded 225 tons for an apartment building on Alexandria Street, Los Angeles. New inquiries include 350 tons for paving work in Ventura County, Cal., and 110 tons for a hospital in Seattle. Little, if any, improvement is noted in out-of-stock prices in the Los Angeles and San Francisco districts, 1.80c., base, continuing general.

Plates.—Featuring the plate market this week was the award made by the General Petroleum Corporation, Los Angeles, to the Western Pipe & Steel Co. for four 134,000-bbl. tanks involving 1600 tons of plates. This company originally put out an inquiry for 14 82,000-bbl. or nine 134,000-bbl. tanks, calling for 2000 tons of material, will be awarded shortly. No action has yet been taken by the Shell Oil Co. on its inquiry for 10 80,000-bbl. tanks, requiring 3100 tons, for its Domingues refinery. Seattle will open bids on Oct. 26 for 231 tons of 24-in. riveted pipe, alternate bids to be taken on cast iron pipe. Bids will be opened next week on 1200 tons for a pipe line at Hood River, Ore.

Warehouse Prices, f.o.b. San Francisco

Base per Lb.	
Plates and struc. shapes.....	3.15c.
Soft steel bars.....	3.15c.
Small angles, $\frac{3}{8}$ -in. and over.....	3.15c.
Small angles, under $\frac{3}{8}$ -in.....	3.55c.
Small channels and tees, $\frac{3}{4}$ -in. to 2 $\frac{3}{4}$ -in.....	3.75c.
Spring steel, $\frac{1}{4}$ -in. and thicker.....	5.00c.
Black sheets (No. 24).....	5.00c.
Blue ann'l'd sheets (No. 10).....	4.00c.
Galv. sheets (No. 24).....	5.40c.
Struc. rivets, $\frac{1}{2}$ -in. and larger.....	5.65c.
Com. wire nails, base per keg.....	\$3.40
Cement c'd nails, 100-lb. keg.....	3.40

The East Bay Municipal Utility District, Oakland, Cal., has purchased the property and distributing main system of the East Bay Water Co. and as a result will not go ahead with its own system of mains, bids on which were opened Aug. 17 and which called for 7200 tons of 24 to 44-in. pipe. Prices range from 2.20c. to 2.25c., c.i.f.

Shapes.—Several structural projects were placed during the week, the tonnage being in excess of 2100 tons. The McClintic-Marshall Co. took 650 tons for an office building at Tucson, Ariz., and the Llewellyn Iron Works secured 275 tons for a store at Long Beach, Cal., 200 tons for an office building in Los Angeles and 130 tons for an office building in Glendale, Cal. The Sand Point, Wash., hangar, calling for 400 tons, was placed with the Western Construction Co. The larg-

est new inquiry involves 300 tons for an apartment in Los Angeles. Plain material remains firm at 2.35c., c.i.f.

Cast Iron Pipe.—Demand for cast iron pipe continues light; only three projects are up for figures. The United States Cast Iron Pipe & Foundry Co. took 142 tons of 4 to 14-in. Class B pipe for Oxnard, Cal. S. A. Moceris was awarded the Sixth Avenue, N. W., improvement project at Seattle, calling for 282 tons of 6 to 12-in. Classes B and C pipe. Bids were opened this week on 1266 tons of 8-in. Class 350 pipe for Los Angeles and bids will be opened on Oct. 26 for 1284 tons of 24-in. Class B pipe for Seattle, alternate bids also to be taken on riveted steel pipe. Owing to the fact that the East Bay Municipal Utility District, Oakland, has purchased the property of the East Bay Water Co., the former's inquiry for 22,325 tons of 24 to 44-in. Class C pipe has been withdrawn.

Steel Pipe.—Oil country goods continue to move well in the southern part of the State. Oil well casing particularly is in demand. No large pipe line inquiries are up for figures.

St. Louis

Pig Iron Firm on Moderate Buying—September Steel Sales Very Heavy—Further Advances in Scrap

ST. LOUIS, Oct. 9.—Although sales of pig iron fell off during the week, the total having been about 5000 tons, the melt is steadily increasing. Shipments of the local maker are heavier. There is a firm tone to the market. The Granite City maker sold 4200 tons, including 1500 tons of malleable, to an Illinois jobbing foundry for shipment over the remainder of the year; 400 tons to an Iowa implement maker and 600 tons to a northern Illinois specialty maker, and the remainder in lots of a carload up to 200 tons. A leading Southern interest sold 400 tons. The stove interests report a gain in business, and there also is a heavy increase in the melt of agricultural factors, as well as among steel mills in lines other than those catering to the railroads. Specifications against contracts are heavy and urgent, and shipments of the local maker for September exceeded those for the same month in 1927 and for August.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b.	
Granite City, Ill.....	\$19.50 to \$20.00
N'th'n No. 2 fdy., deliv'd St. Louis..	20.16
Southern No. 2 fdy., deliv'd.....	20.67
Northern malleable, deliv'd.....	20.16
Northern basic, deliv'd.....	20.16

Freight rates: 81c. Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Coke.—An advance of 25c. a ton on domestic coke for shipments outside of St. Louis has been made by local by-product interests. Buying of foundry coke is fair.

Finished Iron and Steel.—The Granite City Steel Co. booked a greater tonnage in actual specifications dur-

ing last month than in any September since the war. The last half of the month was especially active and the volume of business so great that the company has found it necessary to extend deliveries on new business. All units are now running full, and from present indications should continue so for the greater part of the fourth quarter. The demand is well diversified, not only as to commodities, but with respect to industries. Prices in St. Louis, the Middle West and in the Southwest appear firm. The Missouri Pacific Railroad is inquiring for 30,000 tons of rails for 1929 requirements. Warehouse business in September was about 10 per cent less than in August, although about the same as in September, 1927. The only award for structural steel for several weeks,

1800 tons for a dairy exhibition building, went to the Stupp Brothers Bridge & Iron Co.

Old Material.—Dealers continue to advance prices of old material in an effort to attract shipments to this market so that they may fill outstanding contracts and prepare for buying by consumers, who continue to hold out against higher prices, but are expected to buy soon. Stocks in the hands of dealers here are light, and they must pay higher prices to get shipments from Texas and Louisiana dealers, who have been finding a more profitable market in Europe, while Oklahoma and Kansas dealers have been getting more for their old material in Colorado. Railroad lists are bringing high prices. Heavy melting steel, heavy shoveling steel, bundled sheets, No. 2 railroad wrought, machine shop turnings, steel rails less than 3 ft., cast iron car wheels and No. 1 railroad cast are 50c. a ton higher, while miscellaneous standard section rails, rails for rolling, No. 1 railroad wrought, and stove plate are 25c. higher. Railroad lists include:

Baltimore & Ohio, 9795 tons; Southern Pacific, 6500 tons; Wabash, 2740 tons; Missouri-Kansas-Texas, 1775 tons; Louisville & Nashville, 125 tons; Ann Arbor, 166 carloads; Frisco, 18 carloads; Chicago & Eastern Illinois, 13 carloads.

Dealers' buying prices, per gross ton, f.o.b. St. Louis district:

Heavy melting steel.....	\$12.50 to \$13.00
No. 1 locomotive tires.....	12.50 to 13.00
Heavy shoveling steel.....	12.50 to 13.00
Miscel. stand.-sec. rails including frogs, sw'ches and guards, cut apart..	14.00 to 14.50
Railroad springs.....	15.00 to 15.50
Bundled sheets.....	9.50 to 10.00

Boston

Pig Iron Sales Drop—Coke and Scrap Markets Active—Structural Steel Work Lighter

BOSTON, Oct. 9.—Pig iron sales in the past week were not quite 4000 tons and included close to 1000 tons of Indian iron at \$21.25 to \$21.75 a ton, on dock here, duty paid, for the equivalent of No. 2 grade. Although sales have dropped, foundries are specifying freely against old contracts. Prices remain very firm. No new open inquiries of importance are reported. Current buying is very largely for mixture purposes. The New England melt of iron is increasing, although slowly, and furnace representatives are of the opinion there will be a buying movement before the close of October for filling in last quarter and for the first quarter.

Foundry iron prices per gross ton deliv'd to most New England points:

*Buffalo, sil. 1.75 to 2.25..	\$21.91
*Buffalo, sil. 2.25 to 2.75..	\$21.91 to 22.41
†Buffalo, sil. 1.75 to 2.25..	20.78
†Buffalo, sil. 2.25 to 2.75..	20.78 to 21.28
East. Penn., sil. 1.75 to 2.25	23.65

Ala., sil. 1.75 to 2.25.....	23.16 to 25.02
Ala., sil. 2.25 to 2.75.....	23.66 to 25.52

Freight rates: \$4.91 all rail and \$3.78 rail and water from Buffalo; \$3.65 from eastern Pennsylvania; \$5.21 all rail from Virginia, \$6.91 to \$8.77 from Alabama.

*All rail rate. †Rail and water rate.

Cast Iron Pipe.—Massachusetts has awarded 316 tons of 6, 8 and 10-in. pipe for a Waltham, Mass., hospital job to R. D. Wood & Co., Portland, Me., has closed bids on 800 tons of 6 to 12-in. pipe for delivery after Jan. 1, but has made no award. Pittsfield, Mass., has awarded a contract for

laying 600 ft. of 48-in. pipe to the William D. Burns Construction Co. Warwick, R. I., has completed plans for a \$1,250,000 water system and will shortly be in the market for a large tonnage of pipe. Private pipe business is fair. Foundries are well filled up on 4-in. pipe. The market for 6 to 12-in. stock is at least \$1 a ton lower than a fortnight ago, and concessions are still named on large di-

mensions. Prices are: 4-in., \$45.10 to \$46.10 a ton, delivered common Boston freight rate points; 6 to 12-in., \$40.10 to \$41.10. The usual \$5 differential is asked on Class A and gas pipe.

Shapes and Plates.—The past fortnight was the duller experienced by fabricators this year. Small shops are taking business at low prices. Plate consumers are buying in small amounts. Governor Ralph O. Brewster of Maine intimates that the State will spend \$10,000,000 on bridges during the next year.

Coke.—New England ovens are doing a record-breaking business in domestic coke. One company, in retail sales alone, disposed of about 500 tons a day during the past week. The New England Coal & Coke Co. has lighted another battery of ovens, making a total of 350 now in operation, the full capacity of the plant. Foundry coke users are specifying against contracts freely. The price remains at \$11 a ton, delivered within a \$3.10 freight rate zone. In connection with the sale of \$5,500,000 bonds, the Connecticut Coke Co., New Haven, Conn., announced that part of its product will be sold to industrial consumers. The first cargo of coal ever shipped from Soviet Russia to this country, about 5500 tons, is on its way to Boston. It comes from the Don Basin.

Old Material.—The movement of scrap out of New England continues active. The market for forge flashings, rails for rerolling and steel mill borings is a shade firmer, but no change in prices of other kinds of scrap is noted. Stove plate is in better demand than in months. For Massachusetts consumers, the market is \$10.50 a ton, delivered, and for Connecticut consumption, \$12.50. New England foundries are taking larger quantities of No. 1 machinery cast and textile cast, and stocks in yards have been materially reduced this month. A steamer will load 5000 tons of scrap the last of this month for Danzig. Exporters are buying against this shipment, paying around \$10 a ton for heavy steel and automobile scrap, f.o.b. Boston dock.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel.....	\$10.75 to \$11.00

Railroad malleable	15.00 to 15.50

Birmingham

Steel Orders Large But Pig Iron Buying Is Light—Heavy Melting Scrap Up \$1.50 a Ton

BIRMINGHAM, Oct. 9.—Pig iron inquiries are light and involve small tonnages. A large portion of the requirements for the fourth quarter is already on the books. The price of No. 2 foundry iron is firm at \$16.25. The new No. 6 Fairfield furnace of the Tennessee company is now producing basic iron, having been placed in operation on Sept. 27. The No. 5 Ensley furnace of the Tennessee company was blown out on Oct. 2. Otherwise, operations are unchanged. Of the 19 furnaces in blast, 11 are on foundry, six on basic, one on ferromanganese and one on recarburizing iron.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.....	\$16.25
No. 1 fdy., 2.25 to 2.75 sil.....	16.75
Basic	16.25

Finished Steel.—Orders have been running heavy in the past few weeks. Bookings are better than at any time in the past year, and plant operations are correspondingly high. Inquiries continue good in all lines and prices show considerable firmness. Structural steel fabricating business continues to improve. The Ingalls Iron Works Co. has booked an order for 1800 tons for the Rhodes-Haverty Building, Atlanta. The Virginia Bridge & Iron Co. has an order for 3500 tons for the Sterick Building, Memphis, of which 2000 tons will be fabricated at Birmingham and the remainder at Memphis. Several small orders for reinforcing bars have been booked. Sixteen open-hearth furnaces have been active during the past four weeks. On Oct. 6, the Tennessee company shut down one at Ensley and placed one more in operation at Fairfield keeping the total at 12. The Gulf States Steel Co. is working four at Alabama City.

Cast Iron Pipe.—Inquiries are light. The total of new tonnage is not sufficient to change market conditions or plant operations. The United States Cast Iron Pipe Co. has booked 750 tons of 42-in. pipe for Milwaukee. Bidding is under way on 1500 tons of 24 to 30-in. pipe for Honolulu. The Dallas, Tex., tonnage, on which bids were opened three weeks ago, has not been placed. Makers predict quiet conditions for the next two or three weeks. Shipments are at about the same level as for the past month. Quotations remain at \$36 to \$37.

Coke.—The foundry coke market has been quiet during the past two weeks because all important requirements are covered for the last quarter. Shipments are moving in fair volume. No change has been made in the base quotations of \$5 for both spot and foundry.

Old Material.—Demand is growing stronger and sales show a good increase. Heavy melting steel has ad-

vanced \$1.50 a ton and scrap steel rails 50c. No. 1 cast is stronger. Other prices are the same. Shipments are heavy, and dealers' stocks are being reduced. Shortages are reported in a few lines.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel.....	\$12.50
Scrap steel rails.....	\$12.00 to 12.50
Short shoveling turnings..	8.00 to 8.50
Cast iron borings.....	8.00

Tramcar wheels.....	13.00 to 14.00
Cast iron carwheels.....	13.00 to 13.50
Cast iron borings, chem...	13.50 to 14.00

Detroit

Automobile Production Is Still at a Peak

DETROIT, Oct. 9.—Employment in the Detroit district has indicated a slight slackening of industrial activity in the last two weeks. The labor barometer of the Employers' Association for the past week showed a total of 294,829, a decrease of 2744 from the week previous. The decrease during the week ended Sept. 29 was 3186. In spite of these decreases, however, the totals for last week and the previous week were more than 100,000 ahead of the same periods last year. Employment in the 51 major plants in Toledo for the week ended Sept. 29 totaled 35,869, an increase of 741 over the previous week. The figure of a year ago was 22,617.

Since the introduction on July 28 of its new model, the Buick Motor Car Co. has shipped 64,628. A new weekly production record has been set up with a total of 7600 units. On Friday, Sept. 28, a single hour's production was 150 cars, and on the same day a record was made in the production of 1600 engines. The September shipments of this company totaled 26,800, against 23,871 in the same month a year ago. This shows a slight decrease from the 27,476 shipped in August. Production now is running at about 1370 cars a day.

Shipments of Cadillac and LaSalle cars in September were approximately 5000 units, and it is reported that October and November schedules have been raised to full plant capacity.

The Chevrolet Motor Co. produced 105,616 cars and trucks during September, a 70 per cent increase over the output of September, 1927. The first nine months' output by this company totaled 1,100,723, an increase of 447,969 units over the same period in 1927.

B. E. Hutchinson, vice-president and treasurer of the Chrysler Corporation,

states that production of Plymouth cars will be doubled by Feb. 1, when 1000 units a day of that line will be turned out.

It is estimated that Ford Motor Car Co. shipped 100,000 cars and trucks in September, with daily production running approximately 5000 units a day, exclusive of the Ford Motor Co. of Canada, which is turning out 500 units a day. Thus far, 400,000 units of the new model A have been shipped.

The Graham-Paige Motors Corporation showed a total production for the first nine months of 65,486 units. With a quarterly production of 26,742 units, the third quarter output was more than double that of the first quarter.

The Hupp Motor Car Corporation is still breaking records in monthly production. September showed a total of 6536 cars. In the first nine months of the year 56,992 units were shipped.

A new record was set last month by the Olds Motor Works, with a total of 9301 units, an increase over the August figure, 7892 units, also better than the 7127 units of September a year ago. About 9000 cars are scheduled for October.

Reo production for September totals 3711 units, a decrease from 4823 turned out in August.

Third quarter sales for Willys-Overland were about 75,000 cars, against 39,000 for the same period of 1927.

Blaw - Knox President Denies Merger Reports

Albert C. Lehman, president Blaw-Knox Co., Pittsburgh, has issued a statement denying reports that the company is to be merged with the Universal Pipe & Radiator Co., the Pressed Steel Car Co., and, eventually, with the Baldwin Locomotive Works. Recently I. F. Lehman and George P. Rhodes, directors of the Blaw-Knox Co., were elected directors of the Pressed Steel Car Co., and more recently James D. Rhodes, also a director of the Blaw-Knox Co., was elected president of the Universal Pipe & Radiator Co., while George P. Rhodes and Albert C. Lehman were chosen directors of that company. The merger reports are believed to have grown out of these changes.

The American Telephone & Telegraph Co., New York, in the construction of new long distance telephone facilities during 1928, to cost \$11,042,000, will use 22,282,000 lb. of copper wire in cables, 21,994,000 lb. of copper wire in open wire lines and 39,283,000 lb. of lead and 413,000 lb. of antimony in cable sheaths. The program includes extensions and additions to lines in all parts of the country and to the three transcontinental routes.

Canada

Improvement in Iron and Steel Demand and Production Continues in the Dominion

TORONTO, ONT., Oct. 9.—Practically all manufacturers allied with the iron and steel industry of Canada report general improvement in business. The record crop yield of the Canadian West has had a tendency to bring a stronger demand for agricultural implements. The automotive industry of Canada reports better production than at any time in its history. Mining operations in Ontario, Quebec and Manitoba have helped to stimulate the growing demand for iron and steel. Railroads have been responsible for much of the improvement in mill operations this year.

Robert Dodd, president Lake Superior Corporation, announced that the Algoma Steel Corporation, Sault Ste. Marie, Ont., a subsidiary, will show a profit of \$329,000 on operation account for the quarter ended Sept. 30, against a deficit of \$141,491 in the same period last year.

Pig Iron.—With practically all contract buyers covered to the end of the year, interest in the Canadian pig iron markets centers in the requirements of spot buyers. Both in number and in tonnage, spot sales are increasing. Total weekly sales are between 1500 and 2000 tons. Canadian producers still report strong competition from United States interests in our markets, especially in the Montreal district. While the Port Henry, N. Y., furnace is not shipping as much iron into this district as formerly, imports from that district are keenly felt in the Montreal territory. Agricultural implement makers continue to draw practically all their pig iron from the United States, and, with the increase in their needs, imports are greater than a year ago. Imports of pig iron from Great Britain and the Continent have dropped off and are having little effect on the Canadian market. The price situation is unchanged.

Prices per gross ton:

Basic	24.00
Imported Iron, Montreal Warehouse	
Summerlee	33.50
Carron	33.00

Structural Steel.—For a Bell Telephone Exchange at Monkland and Hampton Streets, Montreal, 500 tons of structural and 150 tons of reinforcing bars will be required. Thomson & Johnson, architects, Belleville, Ont., are receiving bids for the erection of a hotel at Kingston, Ont., for which about 500 tons of structural steel will be needed; other pending jobs include 400 tons for an addition to the Public Library on College Street, Toronto; 200 tons for a school building on Windermere Avenue, Wal-

kerville, Ont., and 150 tons for addition to the plant of the Wallace Barnes Co., Hamilton, Ont.

Old Material.—With consuming plants running almost at capacity, buyers are entering the market at frequent intervals and their spot orders are invariably for larger tonnages than was the case a month or six weeks ago. With the exception of heavy melting steel, for which dealers are now offering \$9.50 per gross ton at Toronto, and \$2 per ton higher for delivery at Hamilton, Ont., there has been no change in prices. Dealers

believe that higher prices are warranted, but consumers are resisting advances. Export demand is drawing heavily on supplies in the Montreal district.

Dealers' buying prices:

Buffalo

Pig Iron Firm but Demand Is Lighter—Steel Plants Busy—Scrap Market Strong

BUFFALO, Oct. 9.—The pig iron market is quiet but firm. No large tonnages were bought during the week, but there was steady booking of lots up to 100 tons at current prices. Some sellers are predicting a further advance for first quarter. The largest inquiry is for 500 tons of malleable from a central New York melter. Shipments have been heavy. In the week ended Oct. 6 barge canal pig iron shipments were 3625 tons.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25.....	\$17.00 to \$18.00
No. 2X fdy., sil. 2.25 to 2.75.....	17.50 to 18.50
No. 1X fdy., sil. 2.75 to 3.25.....	18.50 to 19.50
Malleable, sil. up to 2.25..	17.50 to 18.50
Basic	17.00 to 17.50
Lake Superior charcoal...	27.28

Finished Iron and Steel.—Specifications for all kinds of material have been good, and mill operation is about 90 per cent. A brisk demand for sheets and strips is reported. On strip, quotations are 2.75c. to 2.85c. The local bar and shape market is firm at 2.05c. to 2.10c. A 20-story office building at Niagara Falls, N. Y., will require 1600 to 1800 tons of structural steel, and a school at Newark, N. Y., will require 700 tons. An addition to Auburn Prison, Auburn, N. Y., took 300 tons of reinforcing bars.

Old Material.—The market continues firm and dealers seeking to fill recent orders are having difficulty. Heavy melting steel on a railroad list brought \$16.25, Buffalo. To cover a

recent sizable sale of No. 2 heavy melting steel, dealers are offering \$13.50. They are getting very little material to cover a sale to the same mill of No. 1 steel at \$15.50. It is said that a purchaser of No. 1 steel would now have to pay \$16.50 to \$17. Dealers have offered \$15.25, \$15.50 and \$15.75 for No. 1 steel to cover sales made at \$15.50 to \$16. Some No. 2 steel is going out of this district at \$15.50, delivered Weirton, W. Va., and these shipments are limiting the amount of No. 2 to be picked up in Syracuse, Rochester and Utica districts for local consumption. Some sales of No. 1 machinery cast have been made at \$16 to \$16.25 and grate bars have been sold at \$12.75 to \$13.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades	
No. 1 heavy melting steel.....	\$15.50 to \$16.25
No. 2 heavy melting steel.....	14.00
Scrap rails	14.50 to 15.00
Hydraulic comp. sheets....	14.00
Hand bundled sheets.....	11.00 to 11.50
Drop forge flashings.....	13.50 to 14.00
No. 1 busheling	14.50 to 15.25
Hvy. steel axle turnings..	13.00 to 13.50
Machine shop turnings....	7.25 to 7.75
No. 1 railroad wrought....	13.50 to 14.00
Hvy. steel axle turnings..	13.00 to 13.50
Acid Open-Hearth Grades	
Knuckles and couplers....	16.50 to 17.00
Coil and leaf springs.....	16.50 to 17.00
Rolled steel wheels.....	16.50 to 17.00
Low phos. billet and bloom ends	17.00 to 17.50
Electric Furnace Grades	
Short shov. steel turnings..	12.00 to 12.50
Blast Furnace Grades	
Short shov. steel turnings..	12.00 to 12.50
Short mixed borings and turnings	10.00 to 10.50
Cast iron borings.....	10.00 to 10.50
No. 2 busheling	11.00 to 11.50
Rolling Mill Grades	
Steel car axles.....	18.25 to 18.75
Iron axles	21.00 to 22.00
Cupola Grades	
No. 1 machinery cast.....	15.75 to 16.25
Stove plate	14.00 to 14.50
Locomotive grate bars....	12.25 to 12.75
Steel rails, 3 ft. and under.	17.00 to 17.50
Cast iron carwheels.....	13.00 to 13.50
Malleable Grades	
Industrial	16.00 to 16.50
Railroad	16.00 to 16.50
Agricultural	16.00 to 16.50

Cincinnati

Malleable Pig Iron Sales of 6000 Tons—Sheet Mills Busy— Scrap Advances of 25c. to \$1.25 a Ton

CINCINNATI, Oct. 9.—Purchases of malleable iron by district consumers enlivened the pig iron market somewhat the past week. Individual sales of 2500 tons and 2000 tons were reported, while orders for smaller lots brought the total to about 6000 tons. Inquiries, however, are inconsequential, with the exception of 500 tons of foundry iron for an Indiana melter. Prices are being well maintained. Northern Ohio sellers are holding to \$17.50, base furnace, as a minimum quotation and Southern producers are adhering to \$16.25, base Birmingham. Jackson County silvery iron is moving at a fairly good rate.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	\$18.89 to \$19.89
So. Ohio malleable	20.14 to 20.89
Ala. fdy., sil. 1.75 to 2.25 ..	19.94
Ala. fdy., sil. 2.25 to 2.75 ..	20.44
Tenn. fdy., sil. 1.75 to 2.25 ..	19.94
So'th'n Ohio silvery 8 per cent	26.89

Freight rates, \$1.89 from Ironton and Jackson, Ohio; \$3.69 from Birmingham.

Coke.—Consumers of by-product foundry coke are specifying liberally on current contracts, with the result that shipments this month are running ahead of those in September. A pickup in domestic grades also is noted. A Southern by-product coke maker still is soliciting business in this district at delivered prices which figure back exceptionally low at the ovens. Otherwise prices show stability.

Finished Material.—Specifications for bars, shapes and plates have continued heavy, and prices are steady at 1.95c. to 2c., base Pittsburgh, although it is possible to buy a large tonnage at 1.90c. Structural fabricating shops are busier, but the volume of work ahead is small. The wire goods market is rather quiet, with common wire nails selling at \$2.69 per keg, delivered Cincinnati. This is equivalent to \$2.55 at Ironton, plus a barge rate at 14c. to this city. District sheet mills have had liberal specifications and orders are sustaining production at 100 per cent of capacity.

Backlogs are fairly substantial and insure a continuation of the present high rate of output during the remainder of October. There has been no change in sheet prices. Makers of rail steel reinforcing bars are quoting 1.90c., base Pittsburgh, and claim that they are booking small tonnages at that figure.

Old Material.—Heavy melting steel has advanced \$1 a ton and practically all other items have gone up from 25c. to \$1.25. These sharp increases are accounted for by the fact that dealers, realizing that there is a shortage of steel plant grades, are trying to buy all of the material avail-

able, whereas the holders of scrap are reluctant to sell on the present rising market. Railroad lists closing this week include the Norfolk & Western, 6500 tons; Southern, 7000 tons, and Louisville & Nashville, 12,000 tons. Steel rails make up about 10,000 tons of the total.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel.....	\$13.50 to \$14.00
Scrap rails for melting....	13.50 to 14.00
Loose sheet clippings....	9.50 to 10.00
Bundled sheets	10.25 to 10.75
Cast iron borings.....	9.25 to 9.75
Machine shop turnings....	8.75 to 9.25
No. 1 busheling	10.75 to 11.25
No. 2 busheling	6.50 to 7.00
Rails for rolling	13.75 to 14.25
No. 1 locomotive tires....	13.50 to 14.00
No. 2 railroad wrought....	13.50 to 14.00
Short rails.....	13.25 to 13.75
Cast iron carwheels	12.00 to 12.50
No. 1 machinery cast.....	17.50 to 18.00
No. 1 railroad cast.....	14.25 to 14.75
Burnt cast.....	10.50 to 11.00
Stove plate	10.50 to 11.00
Brake shoes	10.25 to 10.75
Railroad malleable	13.50 to 14.00
Agricultural malleable....	12.50 to 13.00

Youngstown

Valley Mills Operating at Nearly 90 Per Cent—Producers Have Large Unfilled Tonnages

YOUNGSTOWN, Oct. 9.—Production schedules of iron and steel companies in the Mahoning Valley are nearer a 90 per cent rate this week, as specifications for flat-rolled steels are released with liberality. For example, 49 of the Valley's 53 independent open-hearth furnaces are active, the only idle units being those which are down for relining or temporary repairs. The Republic Iron & Steel Co. is operating all 13 of its open-hearths at Youngstown and eight at Warren; the Youngstown Sheet & Tube Co. has 22 of its 24 furnaces in the Youngstown district in use; the Sharon Steel Hoop Co. is operating all six of its furnaces at Lowellville, Ohio. Of 127 Valley sheet mills, 113 are active, as are 14 of 20 tube mills. Seamless pipe mills are operating two turns per day.

Unfilled tonnage with the independents is sufficient to maintain a high average operating rate through October and into November.

Automobile interests are the heaviest buyers. A number of companies developing new models are seeking prices on sheets and strips for first quarter of 1929.

Steel works interests have withdrawn from the merchant pig iron market because of the heavy requirements for hot metal of their own steel-making plants.

Shipments of the Valley independents for the third quarter were considerably ahead of those for either of the two preceding quarterly periods. Earnings for the period are not likely to be as large as the increase in shipments would indicate. Better results in this respect may be expected from the fourth quarter.

The Youngstown Sheet & Tube Co. expects to operate by Dec. 1 its new

by-product coke plant at the South Chicago blast furnaces. Production of coke at this point will materially cut costs of producing pig iron, it is expected.

It is understood that, with the exception of the Ford Motor Co., all of the principal automobile builders have accepted the new fourth quarter sheet prices and the new discount terms.

Little new buying of scrap has developed, as important consumers still are drawing against purchases made some time ago. Dealers, in covering short sales, are obliged to pay \$16.50 to \$17 for heavy melting steel; \$16 to \$16.50 for compressed sheets and \$12 to \$12.50 for machine shop turnings.

The year's operation of simplified recommendations concerning sheet steel, roofing ternes, eaves trough and conductor pipe and files and rasps will be reviewed at the forthcoming annual convention of the National Hardware Association. The Division of Simplified Practice has sent out questionnaires to those interested, seeking information as to the percentage of production in 1927 represented by existing standard sizes, the degree of adherence to the standards, possible changes and related matters.

The Marquette Iron & Steel Co., St. Louis, has been organized to mine iron and manganese ores and smelt them in its own furnace located near Brandsville, Mo., which has a daily capacity of 200 tons. E. M. McGary is president of the company; J. J. O'Brien, vice-president; M. J. Lynn, general manager, and W. H. Hallerberg, secretary and treasurer.

Copper Holds Firm Position, Tin Slightly Weaker, Other Metals Unchanged

Copper.—Although domestic consumers have generally covered their requirements through November and in some instances well into December, the demand from foreign buyers continues fairly active. Sales for shipment abroad are running about 2000 tons a day. Some copper for domestic use is still to be bought for December; current sales are largely made up of orders for that delivery, with a sprinkling of fill-in tonnage for requirements nearer by. Very little

copper is available for October and November. Prices remain unchanged at 15.25c. per lb., delivered in the Connecticut valley, for electrolytic and at 15.50c. per lb., c.i.f. European ports, for exported metal, the official price of Copper Exporters, Inc. There is no apparent desire on the part of producers to see prices go higher, and, if an orderly market continues, the present quotations may be expected to remain through the year.

Tin.—The severe manipulation in recent weeks has kept consumers out of the market. Consumers have bought well and presumably are not in need of further supplies at the moment. Demands from the tin plate industry usually slacken at this season because of reduced operation

of the mills, but the needs of the automobile industry, which takes about one-fifth of this country's tin consumption, continue large. From Monday to Thursday of last week about 500 tons changed hands, mostly among dealers. On Friday the market was more active and sales totaled about 400 tons. On Saturday, usually a dull day, transactions added up to 100 tons. On Monday and Tuesday of this week there were moderate sales. Prices have kept within a narrow range. The low point was on Tuesday at 48.50c., while the highest price was 49.62 1/2c., which was paid on Oct. 3. The London market is weaker. Spot standard was quoted on Tuesday at £218 15s., future standard at £216 10s. and spot Straits at £219 5s.

The Singapore price on Tuesday was £220 15s.

Lead.—Heavy sales last week have been followed by a quieter market this week. Most of the sales were for October and November, for which consumers are now believed to be pretty well covered. Prices are unchanged at 6.32½c. per lb., St. Louis, and 6.50c., New York.

Zinc.—This market is quiet. There is steady buying, but it is in small lots for nearby requirements. Production of ore in the Joplin district last week increased to 12,000 tons, compared with 10,500 tons in the previous week. Stocks of ore are now estimated at more than 56,000 tons, nearly the high point of the year.

Antimony.—Sales of antimony were made throughout the week at 11.50c., New York, duty paid, for spot shipment and at 11c. for future.

Nickel.—This metal is unchanged in price at 35c. per lb. for ingot, 36c. for shot and 37c. for electrolytic.

Aluminum.—Virgin metal, 98 to 99 per cent, is quoted at 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Oct. 9.—Shipments against contracts are heavy. Current purchases of metals are small in total volume. The old metal market is moderately active at unchanged prices.

Prices, per lb., in carload lots: Lake copper, 15.50c.; tin, 50c.; lead, 6.40c.; zinc, 6.35c. in less-than-carload lots; antimony, 12c. On old metals we quote copper wire, crucible shapes and copper clips, 10.75c.; copper bottoms, 9.75c.; red brass, 9.50c.; yellow brass, 7.25c.; lead pipe, 4.75c.; zinc, 3.50c.; pewter, No. 1, 30c.; tin foil, 36.25c.; block tin, 45.25c.; aluminum, 12c., all being dealers' prices for less-than-carload lots.

Higher Output Features London Tin

Continued increase in production continues to feature the London tin market, but the increase during the latter half of this year will not be at the same rate as during the first half, Trade Commissioner Homes S. Fox, London, informs the Department of Commerce.

At the same time consumption seems to remain high, although over the 12 months ended Aug. 31 supplies evidently increased more than deliveries, compared with the preceding 12 months. During August there was a further small increase in total visible supplies, the figure at the end of the month standing at 18,380 long tons (taking the average of the two leading trade authorities).

Straits shipments of tin for the first eight months of 1928 are reported at 64,030 tons, compared with 51,750 tons during the corresponding period of 1927, representing an increase of 12,280 tons. Supplies of Chinese tin,

however, have fallen off, possibly in anticipation of the erection of the proposed smelter in Hong Kong.

Reports received in London from Tasmania state that a new tin-bearing area has been discovered in the southwestern portion of the island, and that negotiations are also under way for the development of tin fields in the northeastern section. Development of alluvial tin deposits in Bohemia also is indicated by reports that it is proposed to start work shortly on five tin-bearing areas in that district, claimed to have a probable life of 20 years.

River Steel Shipments Effect Large Savings

Pittsburgh district steel manufacturers this year will probably save the difference between water and rail freight charges on at least 1,000,000 tons of their product moving beyond the confines of the Pittsburgh district. Latest figures released by the Pittsburgh office, United States Engineers' Corps, show that in August 124,751 net tons of steel products were moved on the Ohio River. This brings the total Ohio River movement for the eight months ended with August to 769,556 net tons, a monthly average of 96,194 tons, which if maintained to the end of the year would mean a total of 1,154,328 tons.

Ohio River tonnage figures offer a close approximation of the movement of steel products to the more distant destinations and provide a more reliable guide to this movement than is furnished by Allegheny and Monongahela River figures. Only 50 tons of steel products moved on the Allegheny in August, but on the Monongahela, the shipments, as reported by lock keepers, totaled 109,738 tons. These streams join to form the Ohio River at Pittsburgh and naturally carry much of the tonnage that is eventually reported by Ohio River lock keepers. Figures of all three rivers include some interplant movements within the Pittsburgh district. Such movements also mean a saving over what the same movement by railroad would cost.

In August the Ohio River tonnage exceeded the total of the movement on the two other rivers, suggesting that all of the tonnage that originated on the Allegheny and Monongahela rivers found its way into the Ohio. But in July, the Ohio River total was 90,145 tons, while the movement on the Monongahela was 91,834 tons, indicating an interplant tonnage of 1689 tons.

Some idea of the saving that is effected by water-borne steel products to more distant destinations may be gleaned from the fact that the cost on commercial lines of conveying steel from the Pittsburgh district to Memphis, Tenn., a distance of 1200 miles, is approximately \$5 a net ton, that charge, including handling costs at both origin and destination. The rail-

road rate to the same destination is 56c. per 100 lb., or \$11.20 per net ton. The indicated saving to Memphis is \$1.25 per ton. River shipments of steel have helped Pittsburgh district mills in reaching distant markets that for a time were closed to them as a result of high freight rates and the abolishment of Pittsburgh as a sole basing point for steel prices. A barge load of wire products, in a recent tow of finished steel products of the Jones & Laughlin Steel Corporation, to be turned over to the Federal Barge Line at Cairo, Ill., for delivery at Minneapolis, illustrates the point.

Oil Company Buyers to Meet in Tulsa, Okla.

The Oil Company Buyers' Group of the National Association of Purchasing Agents will hold a session in Tulsa, Okla., on Tuesday, Oct. 23. The date selected is during the International Petroleum Exposition, which runs from Oct. 20 to 29. One of the subjects scheduled for discussion by the group is the proper marking of valves and fittings for oil country use, and the possibility of standard specifications for these items. The oil company purchasing agents have given considerable thought to this subject for some time, with the result that it will be discussed quite thoroughly when they meet in formal session.

Emory A. Cook, purchasing agent Twin State Oil Co., Tulsa, is chairman of the group. A. M. Bowman, purchasing agent of the Humble Oil & Refining Co., Houston, Tex., and president National Association of Purchasing Agents, is expected to be present.

Pipe Ball Standardization Recommended

WASHINGTON, Oct. 9.—The size of the mandril core and the curvature of the nose, and the length of the bearing of pipe balls will be recommended as a result of a preliminary conference held here on Thursday of last week under the auspices of the Division of Simplified Practice, Department of Commerce. The conference was attended by pipe ball makers and tube mill representatives. The committee selected to draft the recommendation consists of H. P. Evans, Pettibone Mulliken Co., Chicago; J. S. Morrison, J. S. Morrison Co., Pittsburgh; Albert Pancoast, Union Spring & Mfg. Co., Pittsburgh; J. A. Trainor, Taylor-Wharton Iron & Steel Co., High Bridge, N. J., and a representative of the Damascus Crucible Steel Co. The recommendation is to be resubmitted to all pipe mills of the country for approval. The matter of metal sections and design of core on large size balls is to be taken up as a secondary move and worked out by ball manufacturers themselves later.

Fabricated Structural Steel

New Projects Include 26,500 Tons for New York Bridge and 20,000 Tons for Cleveland Union Terminals Co. Bridge Work

SWELLED by 26,500 tons for a bridge over the Kill Van Kull at New York, 20,000 tons for bridges and road work for the Cleveland Union Station and 18,000 tons for a commercial building at Philadelphia, new fabricated projects reported during the week amounted to 61,500 tons. Other sizable projects were 7500 tons for an airplane hangar at Akron, Ohio, and 6700 tons for an additional section of the New York subways. Awards totaled 33,300 tons, the largest having been 4500 tons in buildings for the Pittsburgh Plate Glass Co. at Crystal City, Mo., and 3400 tons for a Y. M. C. A. in New York. Awards follow:

ANDOVER, MASS., 100 tons, boiler house for Phillips-Andover Academy, to New England Structural Co.
 HARTFORD, CONN., 100 tons, brass foundry addition, to Eastern Bridge & Structural Co.
 STATE OF MAINE, 400 tons, highway bridge, to American Bridge Co.
 HOWLAND, ME., 500 tons, highway bridge, to American Bridge Co.
 NEW YORK, 2800 tons, Salvation Army building on West Fourteenth Street, to unnamed fabricator.
 NEW YORK, 3400 tons, Y. M. C. A. Building on West Sixty-third Street, to unnamed fabricator.
 NEW YORK, 1500 tons, apartment building on Fifth Avenue, to Paterson Bridge Co.
 LAWTON, N. Y., 260 tons, highway bridge, to American Bridge Co.
 LONG ISLAND RAILROAD, 200 tons, bridge at Bay Ridge, Brooklyn, to unnamed fabricator.
 JERSEY CITY, 1500 tons, theater on Journal Square, to unnamed fabricator.
 PHILADELPHIA, 1200 tons, Garden Court apartments, to R. B. Lederle & Co.
 ATLANTIC CITY, N. J., 1250 tons, Chalfonte-Haddon Hall apartments, to Bethlehem Steel Co.
 PENNSYLVANIA RAILROAD, 500 tons, miscellaneous work at Philadelphia, to McClintic-Marshall Co.
 PENNSYLVANIA RAILROAD, 218 tons, bridge at Woodbury, N. J., to Phoenix Bridge Co.
 NEW ORLEANS, tonnage not stated, 7680-ft. span over Biloxi Bay, to International Steel & Iron Co.
 SHREVEPORT, LA., 600 tons, municipal auditorium, to Glassell-Wilson Co.
 MEMPHIS, TENN., 350 tons, two barges for Anderson, Tully Co., to American Bridge Co.
 MEADVILLE, PA., 3700 tons, mill for Viscose Co., to McClintic-Marshall Co.
 TARENTUM, PA., 150 tons, coal trestle, to Guibert Steel Co.
 TRAFFORD, PA., 800 tons, micarta buildings for Westinghouse Electric & Mfg. Co., to Jones & Laughlin Steel Corporation.
 RAPP'S MILL, VA., 175 tons, highway bridge, to American Bridge Co.
 PITTSBURGH, 750 tons, five coal barges for Monessen Coal & Coke Co., to Ritter-Conley Co.
 PITTSBURGH, 118 tons, Ohio River lock gates, to Dravo Contracting Co.
 CINCINNATI, 180 tons, St. Louis Church, to McClintic-Marshall Co.
 CINCINNATI, 100 tons, platform at Central Union Station, to McClintic-Marshall Co.
 ERIE RAILROAD, 250 tons, bridge at Youngstown, Ohio, to American Bridge Co.
 NORFOLK & WESTERN RAILWAY, 2500 tons, bridge at Columbus, Ohio, to Mount Vernon Bridge Co.
 CLEVELAND, 600 tons, building for W. S. Tyler Co., to National Iron & Wire Co.

CHICAGO, BURLINGTON & QUINCY, 1200 tons, bridges, to American Bridge Co.
 LA SALLE, ILL., 900 tons, building for Marquette Cement Mfg. Co., to Mississippi Valley Structural Steel Co.
 CRYSTAL CITY, MO., 4500 tons, buildings for Pittsburgh Plate Glass Co., to McClintic-Marshall Co.
 ST. LOUIS, 1800 tons, dairy building for National Exhibition Co., to Stupp Brothers Bridge & Iron Co.
 PLATTSMOUTH, NEB., 1500 tons, bridge, to Omaha Steel Works.
 TUCSON, ARIZ., 650 tons, office building for Consolidated National Bank, to McClintic-Marshall Co.
 GLENDALE, CAL., 130 tons, Professional Building, to Llewellyn Iron Works.
 LONG BEACH, CAL., 275 tons, store, Fourth and Pine Streets, to Llewellyn Iron Works.
 LOS ANGELES, 130 tons, plant for Byron Jackson Pump Co., East Slauson Avenue, to McClintic-Marshall Co.
 LOS ANGELES, 200 tons, office building, 529 South Broadway, to Llewellyn Iron Works.
 SAND POINT, WASH., 400 tons, Government hangar, to Isaacson Iron Works.
 OLYMPIA, WASH., 120 tons, Coweeman River bridge, to Pacific Car & Foundry Co.
 CHELAN, WASH., 124 tons, Cashmere bridge, to unnamed interest.

SEATTLE, 1100 tons, buildings for Zuerbach Pulp & Paper Co. at Hoquiam and Port Townsend, to Wallace Bridge & Structural Steel Co.
 SEATTLE, 390 tons, crane runway for Pacific Coast Steel Co., to Wallace Bridge & Structural Steel Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

NEW YORK, 26,500 tons, bridge over Kill Van Kull between Port Richmond, S. I., and Bayonne, N. J.; bids Nov. 5.
 NEW YORK, 6700 tons, subway section 4. route 106 in Bronx; bids Oct. 16.
 NEW YORK, 800 tons, Brearley School in East Eighty-third Street; Turner Construction Co., general contractor.
 BROOKLYN, 2500 tons, addition to St. George Hotel.
 LONG BEACH, N. Y., 400 tons, school.
 BLOOMFIELD, N. J., 150 tons, Chevrolet garage and service station.
 PHILADELPHIA 16,000 to 18,000 tons, Reading commercial building at Broad and Callowhill Streets; general contract pending.
 NIAGARA FALLS, N. Y., 1600 to 1800 tons, Niagara Falls United office building; bids close in two weeks.
 NEWARK, N. Y., 700 tons, school.
 CLEVELAND, 20,000 tons, bridges and road work for Cleveland Union Terminals Co.
 AKRON, OHIO, 7500 tons, hangar for Goodyear-Zeppelin Corporation.
 AKRON, 400 tons, factory building for General Tire & Rubber Co.
 LORAIN, OHIO, 350 tons, State viaduct.
 COLUMBUS, OHIO, 350 tons, municipal police station.
 CINCINNATI, 550 tons, convent for Sisters of Mercy.
 ROCKFORD, ILL., 1500 tons, foundry for International Harvester Co.
 ALABASTER, MICH., 400 tons, building for United States Gypsum Co.
 BLOOMINGTON, ILL., 400 tons, office building.
 PASADENA, CAL., 100 tons, church; bids being taken.
 LOS ANGELES, 300 tons, apartment building, Hillcrest and Franklin Streets; bids being taken.
 SEATTLE, 231 tons, plates for 24-in. riveted pipe line; bids Oct. 26.

Continental Leadership in Iron and Steel Exports

The iron and steel division, Department of Commerce, has compiled a statement of comparative exports of iron and steel products of various producing countries for the pre-war year 1913 and the after-war years 1920-1927, inclusive, which shows that Germany led during both periods through 1926, giving way in 1927 to France and Belgium-Luxemburg. In 1913 exports from Germany aggregated 6,

491,262 gross tons, Great Britain being second with 4,969,225 tons. During the period following the war Germany again reached first place, exporting 5,347,823 tons in 1926. But in 1927 France exported 5,603,000 tons and Belgium-Luxemburg, 4,607,000 tons, while Germany dropped to 4,230,000 tons—less than 1 per cent above Great Britain. The nearest approach to this volume made by the United States was in 1920, with a total of 4,927,800 tons.

The figures, stated in gross tons, follow:

IRON AND STEEL EXPORTS OF FIVE COUNTRIES

	United States	Belgium-Luxemburg	France	Germany	Great Britain
1927.....	2,183,091	4,607,000*	5,603,000*	4,230,000*	4,200,000*
1926.....	2,167,213	3,765,420	4,191,009	5,347,823	2,987,669
1925.....	1,762,572	3,203,915	4,009,127	3,548,773	3,731,366
1924.....	1,805,977	†	†	†	3,851,435
1923.....	2,010,171	†	†	†	†
1922.....	1,985,733	†	†	2,654,676	†
1921.....	2,209,864	†	†	†	†
1920.....	4,927,800	935,287†	883,932	†	3,251,225
1913.....	2,722,618	1,575,479†	629,674	6,491,262	4,969,225

*Excluding scrap; these figures were not included in the statement made by the division.

†Belgium only.

‡Data not given in statement cited.

PERSONAL

N. L. MORTENSON has been appointed chief engineer of the Cutler-Hammer Mfg. Co., Milwaukee, succeeding T. E. BARNUM, who has been made consulting engineer for the company in order to give uninterrupted attention to engineering problems

N. L. MORTENSON

and outside engineering relations. Mr. Mortenson has been associated with the company for 21 years, the last five as assistant to Mr. Barnum. He was born in Denmark and received his formal technical education in that country and Germany. He has contributed numerous articles to the technical press and has been active in the work of the American Institute of Electrical Engineers and of the Association of Iron and Steel Electrical Engineers.

KENNETH B. SPAULDING, formerly sales manager McCrosky Tool Corporation, Meadville, Pa., has been named sales manager of the Wesson Sales Co., Detroit. The company handles sales of Eclipse interchangeable counterbores and John Bath ground thread taps, and has recently been appointed distributor in Detroit and Chicago for Widia cutting metal manufactured by the Krupp works at Essen, Germany.

SPENCER S. SWASEY has been appointed manager of the equipment department of the Walter A. Zelnicker Supply Co., 511 Locust Street, St. Louis. For the last three years he has been head of his own contracting company at Chicago and previously was associated for 12 years with the George D. Whitcomb Co., Rochelle, Ill., maker of industrial locomotives.

FRED M. YOUNG, president Young Radiator Co., Racine, Wis., has been made a captain in the specialist re-

serve, United States Army Air Corps. He served as aeronautical engineer and pilot in the air service during the war and has kept in touch with the work through his contacts with the automotive engineering field.

O. H. WATSON has been placed in charge of an office which has been opened by the Erie Steel Construction Co., Erie, Pa., at 231 Engineering Building, Chicago.

DAVID D. LUPTON, vice-president David Lupton's Sons Co., Philadelphia, and chairman of the company's industrial committee, was recently presented with a gavel by the members of the present and former committees, as an expression of their appreciation of his leadership and guidance since the inception of the committee nine years ago.

HAROLD L. CRULL has been appointed assistant sales manager of the Oilgear Co., Milwaukee.

A. B. ROOT, JR., formerly assistant to the vice-president of the Hunt-Spiller Mfg. Corporation, South Boston, has been made assistant general manager. He is a past-president of the New England Foundrymen's Association and is active in the affairs of the national organization. E. C. FELTON, also formerly assistant to the vice-president, has been made assistant treasurer of the corporation.

HENRY J. LOWDON, formerly sales manager for the Eldridge Buick Co., Seattle, Wash., has been made general manager of Best Lock Co., Seattle.

JOHN A. OARTEL, director of safety Carnegie Steel Co., Pittsburgh, will speak on "Safety—Plus," at the regular monthly meeting of the Pittsburgh Foundrymen's Association in the Norse Room, Fort Pitt Hotel, Monday evening, Oct. 15.

P. R. HAWTHORNE, welding engineer Petroleum Iron Works Co., Sharon, Pa., will be the speaker at the monthly meeting of the Pittsburgh chapter of the American Welding Society at the William Penn Hotel, Pittsburgh, Wednesday evening, Oct. 31. His subject is "The Petroleum Iron Works Fluid Fusion Process of Welding."

H. A. DEFRIES, metallurgist Ludlum Steel Co., Watervliet, N. Y., will speak on "Nitr alloy" at the October meeting of the Indianapolis chapter of the American Society for Steel Treating, to be held at the Chamber of Commerce, Monday evening, Oct. 15.

J. LEONARD REPLOGLE, formerly head of the Replogle Steel Co., Wharton, N. J., and a director in the War-

ren Foundry & Pipe Corporation, its successor, will become a special partner in the New York Stock Exchange firm of Harris, Winthrop & Co. on Nov. 1.

WILLIAM H. WOODIN, JR., son of William H. Woodin, president of the American Car & Foundry Co. and the American Locomotive Co., New York, has been appointed director of research for the first named company, with headquarters at 30 Church Street, New York. He has named A. H. WOBBE, assistant director of research; J. W. STEINMEYER, research engineer, and R. M. ALLEN, research metallurgist. The younger Mr. Woodin acquired important technical training in the Berwick, Pa., plant of

W. H. WOODIN

the Car & Foundry company, where he served as an iron worker and a practical molder in the shops. He later carried on research and practical experiments in metallurgy and has also been active as a microscopist and electrical engineer. In his new capacity he will be prominently engaged in the development of products outside the railroad equipment field to which the company has recently been devoting considerable time.

WALTER G. HILDORF will be placed in charge of all metallurgical work of the Timken Steel & Tube Co., Canton, Ohio, effective Oct. 15. For several years he has been metallurgical engineer of the Reo Motor Car Co., Lansing, Mich.

C. R. VANCE has been appointed sales manager of the Welker Machinery Co., Inc., 650 Beaubien Street, Detroit. The company was known as the E. H. Welker Co. until Oct. 1.

J. F. DRAPER has returned to the Jamison Steel Co., 77 Natoma Street, San Francisco, as manager of the sales department. He started in business with that company's sales department 14 years ago, but six years later became associated with the Pacific Mfg. & Tool Co., Portland, Ore.

WILBUR B. TOPPING, general manager of sales Republic Iron & Steel Co., Youngstown, has resigned, effective Nov. 1, and ALEXANDER E. WALKER, assistant general manager of sales, has been named to succeed him. Mr. Topping has been with the company for 20 years, his first connection having been at the Pioneer blast furnaces in Alabama. In 1910 he was transferred to the general sales office, at that time located at Pittsburgh. When a Philadelphia district office was opened in 1912, Mr. Topping was appointed its manager. His next position was as Cleveland district sales manager and from there he was transferred to the general sales department in Youngstown and appointed assistant general manager of sales. He was made general manager of sales in 1919. Mr. Walker was a salesman in the Chicago office of the LaBelle Iron Works, Steubenville, Ohio, before he joined the Republic company in 1916 as assistant to the late DANIEL GEARY, then assistant general sales manager in charge of pipe sales. He succeeded Mr. Geary in 1919 and later was made assistant manager of sales in charge of pipe and sheets. With the reorganization of the sales personnel of the Republic company, following its absorption of the Trumbull Steel Co. last April, he was appointed assistant general manager of sales.

S. S. ROBINSON, for six years sales manager at Erie, Pa., for Pickands, Mather & Co., Cleveland, has been appointed assistant sales manager for Pickands, Brown & Co., Chicago. He is a graduate of Harvard University, and began his business career in the Cleveland sales department of Pickands, Mather & Co.

To Learn Engineer's Status in Industry

As a part of a plan to ascertain the status of the mechanical engineer in industry, members of the Machine Shop Practice Division of the American Society of Mechanical Engineers are being canvassed by a questionnaire calculated to learn the ages and salaries of men engaged in specific positions in the machine shop field. The questionnaires are to be compiled without signatures and represent an activity of the society to be extended probably to all the professional divisions of the organization. The findings are to be compiled in a general report.

Bituminous coal production in the United States for the week ended Sept. 29 is reported by the Bureau of Mines at 11,059,000 net tons. This is the largest production for several months, and is just 1,000,000 tons higher than in the corresponding week of 1927. Production for the year to date, however, is 40,000,000 tons behind 1927, standing this year at 352,977,000 tons.

American Mining Congress in Washington

Congressional legislation affecting the mining industry, including federal taxation of mines; advanced steps in the mechanization of mines; and improved production and marketing methods for minerals, will be considered by the American Mining Congress at its thirty-first annual convention to be held in Washington Dec. 5 to 8, inclusive, at the Mayflower Hotel. It is expected that the program will include addresses by members of Congress, officials of government bureaus dealing with mining questions and leading metal and coal mining operators from the various producing fields.

Fix Date for Hearings on Scrap Definitions

Following the suggestion of the shippers' subcommittee appointed in April at the instance of the Consolidated Classification Committee to prepare a description of scrap iron and steel, arrangements have been made for three meetings at which shippers and consumers of scrap will have an opportunity to discuss with the classification committee the definition proposed by the subcommittee. This definition was printed in THE IRON AGE of Sept. 6, page 584. The meetings, all scheduled for 10 a. m., are to be held on Oct. 18, in room 404, 143 Liberty Street, New York; on Oct. 24, in room 404, Chicago Union Station, Chicago, and on Oct. 31, in room 1015, 101 Marietta Street, Atlanta, Ga. Later a conference with the railroads in Washington is planned, to which representatives of the Interstate Commerce Commission will be invited to approve the description agreed upon by the classification committee and the shippers' subcommittee.

Classification of Coal

A standard classification for coal is proposed and described in Bulletin No. 180 of the Engineering Experiment Station of the University of Illinois, Urbana. This pamphlet of 62 pages, by Prof. Samuel W. Parr, may be obtained from the university for 35c. Briefly, Professor Parr proposes the progressive grading of solid fuels in 10 groups: Anthracite, semi-anthracite; bituminous A; bituminous B; bituminous C; bituminous D; lignite; peat; cannel and wood.

The limits of volatile matter are governing factors in the first four groups, the percentages running in the first up to 8, then 8 to 12, 12 to 24, and 24 to 50. Bituminous C and D are of higher volatile matter than B, but there is overlapping in the groups. The pamphlet gives a large number of analyses of coals from all over the United States and a number of foreign countries, more than half its volume being occupied by tables.

Obituary

ABRAM JAMES, proprietor of the Pioneer Foundry, LaCrosse, Wis., died Sept. 30 after a brief illness, aged 74 years. He was born in England and came to America in 1869, joining several brothers in the ownership and management of the Pioneer shop, established in 1856 as one of the first foundries in Wisconsin west of Milwaukee.

DANIEL PARDEE SMITH, one of the organizers of the Reed Mfg. Co., Newark, N. Y., died at his home in that city on Oct. 1, aged 85 years. He served as president of the company for many years and prior to his retirement some years ago was active in public utility work in the surrounding district.

GEORGE E. HALL, for 12 years president and general manager of the Boston Woven Hose & Rubber Co., Boston, died suddenly at Osterville, Mass., on Oct. 3. He was born at Brattleboro, Vt., in 1868, and before joining the Boston company in 1907, was associated with the International Paper Co., Watertown, N. Y.

ROBERT LAIDLAW, one of the founders of Laidlaw & Dunn, Cincinnati, now a plant of the Worthington Pump & Machinery Corporation, died Oct. 6 at Brockville, Ont., aged 80 years. He was active in business and civic circles in Cincinnati prior to 1899, when he retired.

More Men Working in Manufacturing Plants

Employment in manufacturing industries increased 1.5 per cent in August, compared with July, and payroll totals increased 3.2 per cent, according to returns to the Bureau of Labor Statistics, Department of Labor. Increased employment was shown in all branches of the iron and steel group except cast iron pipe and machine tools. Iron and steel employment in general rose 1.3 per cent, while the cast iron pipe industry showed a decline of 0.1 per cent and the machine tool industry a drop of 5.4 per cent. Structural iron work employment increased 4.1 per cent, and employment in foundries and machine shops increased 0.5 per cent.

Rates on iron and steel scrap, in carloads, from points in Central Freight Association and Western Trunk Line territories to Kokomo, Ind., were held to be unreasonable and unduly prejudicial to the extent that they exceed 85 per cent of the contemporaneous sixth class rates, in a recent report by William A. Disque, attorney-examiner of the Interstate Commerce Commission. The complainant was the Continental Steel Corporation, whose plant at Kokomo, according to the report, uses between 250,000 and 300,000 tons of scrap annually.

Machinery Markets and News of the Works

Business Still at a High Rate

Machine Tool Orders and Inquiries in First Week of October Show No Letdown

MACHINE tool business in the first week of October showed no letdown from the high rate of September. The automobile and aviation industries continue important factors in maintaining the volume of machinery sales, but orders come from diversified sources. Indications are that the high sales records of July, August and September will be equaled, at least, in October.

Production at machine tool plants, while spotty, is in most cases at nearly full capacity. Night shifts are not uncommon in the effort to meet delivery promises. Unfilled orders have accumulated at some plants so that dif-

ficulties are experienced in making early shipments.

The White Motor Car Co., Cleveland, will buy considerable shop equipment for the manufacture of a new truck model it will put on the market soon. Orders from automobile companies in the past week included one from a Detroit company for six automatic lathes, while a maker of airplane engines ordered four large engine lathes.

Foreign business has been increasing. Cincinnati machine tool builders have received orders for five production lathes for Czechoslovakia and four lathes for Holland.

New York

NEW YORK, Oct. 9.—The week's business in machine tools consisted of a fairly large number of single-machine orders and one order of considerable size for special machinery. September business was good, and compared favorably with that of August, which was a good month. So far this month there has been no apparent let-down either in the number of orders or inquiries, and local sellers are confident that the recent satisfactory market condition will remain through October. Inquiries for heavy tools, including several large lathes, were better in the past week than they have been in some time.

Niles-Bement-Pond Co. has sold a 42-in. x 14 ft. Time-Saver planer. Sales by Pratt & Whitney division of that company included three vertical shapers, five thread milling machines, two jig borers, two profiling machines, two lathes, nine deep-hole drilling machines, rotary surface grinder and a production hand miller.

Plans have been approved by General Petroleum Corporation of California, Inc., 26 Broadway, New York, a subsidiary of Standard Oil Co. of New York, same address, for new refinery at Torrance, Cal., with capacity for handling 30,000-bbl. crude oil per day, and storage and distributing facilities for 134,000 bbl., to cost about \$2,500,000 with equipment.

Montgomery Ward & Co., Chicago Avenue and Larrimore Street, Chicago,

have awarded general contract to Wells Brothers Construction Co., 53 West Jackson Boulevard, Chicago, for a one, three and eight-story storage and distributing plant at Albany, N. Y., to cost about \$1,500,000 with equipment.

Richmond Engine & Machine Works, Inc., 1836 Victory Boulevard, Port Richmond, S. I., William Cairney, president, has purchased part of property of Continental Milling & Warehouse Co. at New Brighton, improved with three-story shop, for establishment of new marine repair works. Present plant will be continued.

American Can Co., 120 Broadway, New York, has engaged Turner Construction Co., 420 Lexington Avenue, to prepare plans for a four-story plant at North Street and Wythe Avenue, Brooklyn, 90 x 200 ft., to cost close to \$200,000 with equipment.

James P. Boyland, 305 East Kingsbridge Road, New York, architect, has plans for a two-story automobile service, repair and garage building, to cost about \$190,000 with equipment.

Rizuto Motor Co., Peekskill, N. Y., is having plans drawn for a one-story service, repair and garage building, to cost about \$100,000 with equipment. Fletcher-Thompson, Inc., 542 Fairfield Avenue, Bridgeport, Conn., is architect and engineer.

Aviation Corporation of the Americas, Inc., 100 East Forty-second Street, New York, recently organized to take over and expand Pan-American Airways, Inc., same address, has disposed of block of common stock, totaling about \$3,000,000, and plans expansion, including airport

construction, aircraft manufacture, and other work for establishment of air lines between United States and West Indies, Central and South America. Richard F. Hoyt is chairman of board.

Board of Trustees, Union Free School District No. 1, Altamont, N. Y., is considering installation of manual training equipment in new junior high school at Tupper Lake, to cost about \$300,000. A. Howell Knox, 140 South Dearborn Street, Chicago, is architect.

Klein Iron Works, 65 Broadway, Astoria, L. I., is planning one and two-story addition, 100 x 135 ft., to cost about \$75,000 including equipment.

Sikorsky Aviation Corporation has been formed with capital of 200,000 shares of stock, no par value, to take over Sikorsky Mfg. Co., College Point, L. I., manufacturer of airplanes and parts. New company has disposed of 100,000 shares of stock, portion of fund to be used for increased production. Agreement has been made with Curtiss Flying Service, Inc., Buffalo, for exclusive rights for sale of Sikorsky aircraft for commercial use in United States, and similar contract for export with Curtiss Airplane Export Corporation, also of Buffalo. Igor Sikorsky is one of heads of company.

R. H. Macy & Co., Broadway and Thirty-fourth Street, New York, have awarded general contract to Nieman Irving & Co., Inc., 30 East Forty-second Street, for four-story addition to automobile service, repair and garage building, 100 x 100 ft., to cost more than \$175,000 with equipment.

Office of Constructing Quartermaster, Picatinny Arsenal, Dover, N. J., will receive bids until Nov. 6 for new operating buildings, including group of 21 buildings in melt loading area, three buildings in shop area, 13 buildings in laboratory area and administration building.

Lackawanna Railroad Co., 90 West Street, New York, has acquired 15 acres at Jersey City, N. J., for new group of multi-story storage and distributing buildings, with main unit 162 x 848 ft., including unloading, elevating, conveying and other handling equipment. Project is reported to cost more than \$1,500,000.

System Brake Service, Inc., 54 Sussex Avenue, Newark, has plans for a one-story machine and automobile repair shop, to cost about \$25,000. Simon Cohen, 130 Branford Place, is architect.

Public Service Electric & Gas Co., Public Service Terminal, Newark, is planning construction of two-story substation at 1223-29 Broad Street, to cost close to \$70,000 with equipment; one-story and basement meter and compressor plant at Piscataway, N. J., to cost more than \$35,000 with equipment, and two-story substation on Norfolk Street, Newark, to cost about \$45,000 with equipment.

National Air Transport, Inc., 5930 South Cicero Avenue, Chicago, is reported planning new hangar, with shop and repair facilities, at municipal airport, Newark, to cost over \$50,000 with equipment.

The Crane Market

ONLY a small number of new inquiries for overhead cranes have appeared in the New York district during the past week. Business in the South and West, however, continues active and most of the orders booked recently have been from these territories. An overhead crane builder in Chicago recently received an order from a large public utility company in that city for a 150-ton, 135-ft. span electric crane. Some desirable orders for locomotive cranes are pending, particularly the crawl-tread type. D. C. Serber, Inc., New York, is reported considering the purchase of a locomotive crane and other contractors with subway contracts or bidding for such work are interested in buying. The Island Transport Co., 120 Broadway, New York, is understood to be in the market for two locomotive cranes for export to St. Pierre Miquelon.

In Pittsburgh attention is centered on the requirements of the National Tube Co. for its new skelp mill at McKeesport,

Pa., and those of the American Sheet & Tin Plate Co. in connection with a program of plant betterments recently started at its Vandergrift works, and the cranes that have been pending for the Clairton works of Carnegie Steel Co.

Among recent purchases are:

Viscose Co., Marcus Hook, Pa., 22-ton, 8-wheel, steam locomotive crane from Orton Crane & Shovel Co.

Steel sales Corporation, Chicago, 5-ton, 46-ft. span, overhead electric crane from Whiting Corporation.

Brennan Stone Co., Bridgeport, Conn., 6-ton, 2-motor, overhead crane from H. D. Conkey & Co.

Wisconsin Power & Light Co., Madison, Wis., 10-ton, double girder hand power crane for power station from H. D. Conkey & Co.

St. Louis-San Francisco Railroad Co., St. Louis, 8-ton, hand power crane from H. D. Conkey & Co.

Endicott Forge & Mfg. Co., Endicott, N. Y., 3-ton hand power crane from H. D. Conkey & Co.

Dakota Power Co., Rapid City, S. D., 5-ton, double I-beam hand power crane from H. D. Conkey & Co.

City of Topeka, Kan., four 2-ton underhung push type cranes from H. D. Conkey & Co.

Missouri Pacific Railroad, 20-ton gantry crane for use at Wichita, Kansas, from Whiting Corporation.

Dallas Brass & Copper Co., Chicago, two 3-ton wall bracket jib cranes and one 3-ton underhung electric crane from H. D. Conkey & Co.

Great Lakes Forge Co., Chicago, two 2-ton single I-beam cranes from H. D. Conkey & Co.

Hudson Motor Car Co., Detroit, 1-ton, 17-ft. span, motor driven crane from H. D. Conkey & Co.

Conrad Foundry Co., Montgomery Street, Elizabeth, N. J., gray iron and aluminum castings, has been sold to Ware & Leonard Foundry Co., which will operate plant.

Reiche & Penner, Inc., structural and ornamental iron works, 673-677 Lexington Avenue, Brooklyn, is building a 60 x 100 ft. addition to its plant. Frank Penner is president.

New England

BOSTON, Oct. 8.—New equipment, especially for high production, is more active than appears on the surface. Recent sales include \$40,000 worth of shop equipment to a Hartford manufacturer, and numerous individual tools to Connecticut Valley, Rhode Island and Massachusetts users. The largest buyers and prospective purchasers are those manufacturing automobile and radio parts.

The local used tool market is slow. A Connecticut dealer selling discarded equipment of a General Motors subsidiary is invading Massachusetts, New Hampshire, Vermont and Rhode Island with low prices. Another Connecticut dealer, specializing in gear making and special equipment, is also making broad terms and securing considerable business. A new Worcester shop has just purchased about \$5,000 worth of machine tools, and a Cambridge plant has bought rebuilt milling machines.

Small tools are very active. September was a big month and October is starting off even more encouragingly. The improvement is due to a greater distribution of small tools rather than to an expansion in machine tools.

Vacuum Co., 105 Mystic Avenue, Somerville, Mass., has started work on a \$100,000 addition and alterations.

McClintock & Craig, 458 Bridge Street, Springfield, Mass., have closed bids on a one-story plant, 120 x 140 ft., to be built by Moore Drop Forge Co., Chicopee, Mass.

Henry Perkins Co., Bridgewater, Mass., has under consideration a foundry addition. Details will be announced shortly.

Van Norman Machine Co., 160 Wilbraham Avenue, Springfield, Mass., will build a two-story addition, 23 x 83 ft., and make plant alterations.

No date has been set for bids to close on a one-story machine shop, 40 x 100 ft., to be erected by Everett Avenue Auto Parts Co., 234 Everett Avenue, Chelsea, Mass.

Norton Co., New Bond Street, Worcester, Mass., abrasives and grinding machinery, will start work soon on a one-story, 39 x 78 ft., addition.

William J. Murdock Co., 347 Washington Avenue, Chelsea, Mass., electric specialties, will start work soon on a two-story plant 50 x 95 ft. Eisenberg & Feer, 46 Cornhill, Boston, are architects.

Plans are being arranged by Case Board Co., Andover, Conn., manufacturer of fibreboard products, for rebuilding part of mill destroyed by fire recently, with loss about \$75,000 with equipment. Christopher Case is head.

Russell Mfg. Co., Middletown, Conn., manufacturer of brake lining, etc., has plans for new branch plant at St. Johns, Que., to cost about \$125,000 with equipment.

Blackall, Clapp & Whittemore, 31 West Street, Boston, architects, are completing plans for a one-story automobile service, repair and garage building at Milton, Mass., to cost about \$135,000 with equipment.

George M. MacKenzie, New Haven, Conn., has filed plans for a one-story machine shop, 50 x 150 ft. Leo F. Caproni, 1056 Chapel Street, is architect.

F. C. Hersee Co., 47 Bacon Street, Watertown, Mass., manufacturer of automobile tools, has awarded general contract to L. C. Titus, 50 Lincoln Street, for one-story addition, 50 x 100 ft., with extension, 30 x 45 ft., to cost about \$45,000 with equipment.

United States Oil Co., Providence, R. I., plans rebuilding of portion of four-story plant recently destroyed by fire, with loss about \$40,000 including equipment.

Bush Mfg. Co., Inc., 100 Wellington Street, Hartford, Conn., manufacturer of automobile radiators and parts, has awarded general contract to Industrial Construction Co., 721 Main Street, for a

one-story addition, 50 x 50 ft., to cost about \$25,000 with equipment.

Mason & Parker Mfg. Co., Winchendon, Mass., manufacturer of toys, has taken over a three-story factory at Fiskdale, Mass., for new branch plant.

Strathmore Paper Co., Mittineague, Mass., has awarded general contract to L. S. Wood, 14 Stockbridge Street, Springfield, Mass., for four-story addition to mill at Woronoco, Mass., 50 x 200 ft., to cost about \$150,000 with equipment.

Peerless Unit Ventilation Co., Inc., has removed main office and factory to 719-734 Crescent Avenue, Bridgeport, Conn. New York office remains at 369 Lexington Avenue.

South Atlantic

BALTIMORE, Oct. 8.—Contract has been let by International Harvester Co., Chicago, to J. L. Robinson Construction Co., 522 Park Avenue, Baltimore, for one-story factory branch, storage and service plant, 125 x 250 ft., for motor truck division at Baltimore, to cost about \$125,000 with equipment.

Nardin-Armstrong Co., Bedford, Va., H. E. Armstrong, president, will build new one-story plant, 150 x 350 ft., to manufacture tools, dies, steel stampings and kindred products, to cost about \$70,000 with equipment.

Hampton Smith, 506 McBee Avenue, Greenville, S. C., is at head of project to establish local plant for manufacture of textile machinery and parts. Company will be organized to carry out enterprise.

General Purchasing Officer, Panama Canal, Washington, will receive bids until Oct. 16 for motor-driven shaper, two single planers, motor-driven hand jointers, machinists' hammers, sledge hammers, hand saws, axes, augers, and other tools, Panama Schedule 1905; until Oct. 26 for bolt-cutting machine, power band saw, hand saws, vises, reamers, drills, hoists, and other equipment, Panama Schedule 1907.

Officials of Parker Metal Decorating Co., Howard and Ostend Streets, Baltimore, headed by Edwin A. Parker and Harry G. Evitt, have organized Independ-

ent Can Co., with capital of \$1,000,000, to establish local plant to manufacture tin cans. Company will be managed in close affiliation with Parker company.

Board of School Commissioners, Charlotte, N. C., is considering installation of manual training equipment in addition to Alexander Graham Junior High School, to cost over \$200,000, for which bids will be asked on general contract in November. Charles C. Hook, Commercial Bank Building, is architect.

Virginia Public Service Co., Charlottesville, Va., is said to be acquiring property on Big and Little Rivers, Rockbridge County, as site for hydroelectric generating plant, project to cost about \$2,000,000 including transmission lines.

American Oil Co., American Building, Baltimore, has awarded general contract to Bonham Engineering & Construction Co., Bridgeton, N. J., for new storage and distributing plant near Bridgeton, to cost over \$50,000 with equipment. T. J. O'Connell is company engineer.

Savannah River Electric Co., operated by Southeastern Power & Light Co., 120 Broadway, New York, is reported planning construction of hydroelectric generating plant on Savannah River, near Augusta, Ga., with transmission lines to connect with other properties of company. Project will cost over \$10,000,000.

Philadelphia

PHILADELPHIA, Oct. 8.—Plans are being completed by Edgcomb Steel Co., Eleventh and Cambria Streets, Philadelphia, for one-story storage and distributing plant, to cost about \$135,000 with equipment.

Mitchell Specialty Co., Inc., Edmund and Shelmire Streets, Philadelphia, manufacturer of automobile hardware, has awarded general contract to I. A. Stoutenburg, 3438 North Marvins Street, for one-story addition to machine shop, to cost about \$36,000 with equipment.

William L. Charr and Harry Kattelman, Victory Building, Philadelphia, architects, have plans for a four-story automobile service, repair and garage building, 60 x 100 ft., to cost about \$150,000 with equipment.

Atwater Kent Mfg. Co., Wissahickon Avenue and Abbottsford Road, Philadelphia, manufacturer of radio equipment, is having plans drawn for a one-story plant unit, to cost over \$100,000 with machinery. Ballinger Co., Twelfth and Chestnut Streets, is architect and engineer.

Cramp-Morris Industrials, Inc., Richmond and Norris Streets, Philadelphia, manufacturer of turbine engines and other heavy machinery, has asked bids on general contract for a one-story pipe shop.

Piers and Terminals Division, Merchant Fleet Corporation, Washington, will soon ask bids for 25 steel tackle structures at Tidewater Terminal, Philadelphia, for unloading lumber, etc., each unit to have capacity of about 10 tons, providing for mechanical handling of material.

Philadelphia Air Terminal, Inc., 225 South Fifteenth Street, Philadelphia, C. D. Rottner, in charge, has engaged B. R. Shaw Co., Inc., 810 Olive Street, St. Louis, engineer, to prepare plans for airport on site bounded by Swanson, Fifth and Pattison Streets and Parker Avenue, including hangars, repair shops, oil storage and other buildings, to cost about \$1,000,000.

International Harvester Co., 2905 North Sixteenth Street, Philadelphia, and 606 South Michigan Avenue, Chicago, has purchased property at Erie Avenue and F Street, Philadelphia, comprising two-story factory, two one-story automobile service and garage buildings and one-story shop, for new factory branch and distributing plant for motor truck division.

Board of Education, Trenton, N. J., plans installation of manual training equipment in new two-story senior high school, to cost about \$2,000,000, for which bids will be asked on general contract early in November. Ernest Sibley, Bluff Road, Palisade, N. J., is architect.

Department of Institutions and Agencies, State Office Building, Trenton, N. J., William J. Ellis, commissioner, is asking bids on general contract until Oct. 16 for a one-story industrial shop unit at Colony for Feeble-Minded, Vineland, to cost \$100,000 with equipment. C. N. Leatham, State Office Building, is architect.

Refrigerator Equipment Co., Wilmington, Del., recently organized, has acquired plants and businesses of Knox Products Co., Fourth and Greenhill Avenues, manufacturer of refrigerators, cold room equipment, refrigerator insulation specialties, etc., and Glacifer Co., Kennett Square, Pa., manufacturer of refrigerator equipment and materials. New company will consolidate organizations, continuing both plants in service. An expansion program is planned. Severn P. Ker, Jr., is president of new company; George B. Scarlett, vice-president, and W. W. White, secretary and treasurer.

Louis Levy, 5941 Pine Street, Philadelphia, and associates have organized Quaker Metal Products Co., with capital of \$20,000, and will operate local plant for manufacture of metal goods. Louis Powell, Fourth and Snyder Streets, is also interested in new company.

Baily Mfg. Co., Beaver Street, North Wales, Pa., manufacturer of automobile bodies, etc., is said to be planning to rebuild part of plant destroyed by fire Sept. 28, with loss reported over \$125,000 with equipment.

Heintz Mfg. Co., Front Street and Olney Avenue, Philadelphia, manufacturer of automobile bodies and parts, is erecting a new building to cost \$300,000 and not \$27,000, as stated in these columns last week.

Pittsburgh

PITTSBURGH, Oct. 8.—Machine tool business is fairly active in this district, although most of the sales are single tools. Inquiry is good. In heavy equipment, interest centers in a 36-in. blooming mill and a structural mill, which the Aluminum Co. of America is planning for its Massena, N. Y., works, for rolling aluminum in shapes for railroad and street cars.

West Pennsylvania Power Co., West Penn Building, Pittsburgh, is planning new one-story equipment storage and distributing plant, 100 x 250 ft., with repair department, shop and garage, at Connellsville, Pa., to cost \$160,000 with equipment.

Whitaker Paper Co., 101 Ninth Street, Pittsburgh, has engaged R. Maurice Trimble, Commonwealth Annex, architect, to prepare plans for storage and distributing plant, 140 x 540 ft., to cost about \$200,000 with equipment.

DuPont Engineering Co., Du Pont Building, Wilmington, Del., has plans for a

new electric power plant at Belle, W. Va., to cost over \$150,000 with equipment.

Zenith Airway Co., Uniontown, Pa., is negotiating for site for new plant at Wellsville, Ohio, and contemplates early removal. Works will cost more than \$50,000 with equipment. Chamber of Commerce, Wellsville, is interested in project.

Marine Mfg. & Supply Co., 35 Water Street, Pittsburgh, manufacturer of barge and other marine equipment, has been reorganized and plans expansion. L. V. Stevens is president; William K. Stamets, vice-president, and Clifford B. Connelly, secretary and treasurer.

Detroit

DETROIT, Oct. 8.—Contract has been let by Briggs Mfg. Co., 11631 Mack Avenue, Detroit, manufacturer of automobile bodies, to Otto Misch Co., 159 East Columbus Street, for one-story addition, 140 x 370 ft., to cost about \$100,000 with equipment.

Grace Construction Co., Fort Wayne, Ind., road contractor, has acquired three-acre tract at Marshall, Mich., for new plant. Initial structures will include one-story machine shop for repair of road machinery, including parts production, and general equipment storage and distributing plant.

Newaygo Portland Cement Co., Newaygo, Mich., is clearing ground at Charlevoix, Mich., for a new cement mill, to cost over \$650,000 with machinery.

Fisher Body Corporation, General Motors Building, Detroit, has asked bids on general contract for new one-story plant, 100 x 750 ft., with steam power plant and office building, to cost more than \$550,000 with equipment.

Kalamazoo Loose Leaf Binder & Equipment Co., Kalamazoo, Mich., has plans for new one-story plant, to cost about \$40,000 with equipment. O. F. Miller, Pratt Building, is architect.

George L. McCarthy, Grand Rapids, Mich., and associates have leased building on Kent Street, Portland, Mich., for aircraft manufacture. Initial output will be devoted to monoplanes, including parts production and assembling. Engine units will be secured from outside sources.

Grand Rapids Store Equipment Co., Monroe Avenue, N. W., Grand Rapids, Mich., manufacturer of show cases, etc., has awarded general contract to Owens-Ames-Kimball Co., Pearl Street, for a one-story and basement addition, 100 x 165 ft., with extension, 40 x 100 ft., to cost about \$70,000 with equipment.

Federal Motor Truck Co., Federal Avenue, Detroit, is arranging for construction of two-story addition, to cost about \$140,000 including equipment.

Chevrolet Motor Co., 3044 West Grand Boulevard, Detroit, will re-equip and re-tool its foundry unit at Saginaw, Mich., and carry out other changes and improvements preparatory to starting production on new models.

A. C. Spark Plug Co., Harriet Avenue, Flint, Mich., is considering one-story addition, 145 x 275 ft., primarily for die-casting and heat-treating service, to cost about \$160,000 with equipment.

American Coil Spring Co., 1455 West Thirty-seventh Street, Chicago, is completing plans for new works at Muskegon, Mich., initial unit to total about 20,000 sq. ft. of floor space, to cost about \$50,000. Present plant will be removed to new location, as well as plant of Monarch

Steel Treating Co., Chicago, recently acquired.

Manufacturers Foundry Co., Holland, Mich., has been organized to make gray iron castings. Plant is in operation and materials and equipment are being purchased.

Buffalo

BUFFALO, Oct. 8.—Plans are being arranged by G. Elias & Brother, 965 Elk Street, Buffalo, for new one- and two-story airplane manufacturing plant at Cheektowaga, near Buffalo, including parts production and assembling, to cost over \$100,000 with equipment.

Precision Die Casting Co., Syracuse, N. Y., has acquired property at Cleveland for new branch plant, to cost about \$100,000, with equipment.

Everlasting Sign Corporation, Fourteenth Street and Buffalo Avenue, Niagara Falls, N. Y., has plans for new two-story plant, to cost about \$25,000 with equipment. J. R. White, 426 Third Street, is architect.

Joseph A. Sanders, 115-17 Lathrop Street, Buffalo, operating a sheet metal-working and roofing plant, has acquired adjoining property and plans addition to double, approximately, present floor space, to cost more than \$30,000 with equipment.

Marine Elevator Co., Childs Street and Buffalo River, Buffalo, has filed plans for a new one-story machine shop.

Utica Structural Steel Corporation, Utica, N. Y., recently organized, will take over Andrews Iron & Steel Co., with local plant. New company proposes addition to mill in East Utica district, early next year. Wilbur F. Helmer is general manager.

City Council, City Hall, Syracuse, N. Y., W. D. Robbins, city manager, has plans for a new municipal airport, including hangar, repair shop and other units.

Milwaukee

MILWAUKEE, Oct. 8.—New business in machine tools continues good and, judging by the scope and character of inquiry, prospects for the future are promising. Locally, the situation is regarded as the best in several years, for, despite heavy buying of equipment for several months, a comparatively large volume remains to be placed. Prospective buyers cover a wide range of industries.

Milwaukee employment increased 692 persons during September, and the Oct. 1 figure of 38,077 in 50 typical plants is 2533 higher than a year ago, and the highest peace-time record.

Nordberg Mfg. Co., Milwaukee, will enlarge its works at Oklahoma Avenue and Chicago Road at an estimated cost of \$500,000, following acquisition of crusher business of Symons Brothers Co., Chicago, for which Nordberg company has been manufacturing two-thirds of its crusher machinery requirements. Nordberg company has negotiated a new issue of \$1,000,000 of 6 per cent serial gold bonds to cover purchase of Symons business and enlargement of its works. Robert E. Friend is president.

Oilgear Co., 661 Park Street, Milwaukee, manufacturer of broaching machines, presses, pumps, feeds and transmissions, is enlarging its works at a cost of \$175,000 by a machine shop addition,

100 x 180 ft., with a second story, 20 x 100 ft., for offices. Worden-Allen Co., Milwaukee, is general contractor.

Highway Trailer Co., Edgerton, Wis., has leased three buildings of former Moline Wagon Co. at Stoughton, Wis., and is installing equipment to manufacture steel and wood bodies for trailers and motor trucks. Space released in main works at Edgerton will be devoted to production of trailers, axles, etc.

Milwaukee Foundry Equipment Co., 473 Idaho Street, Milwaukee, is erecting a new factory, 70 x 130 ft., part two stories, to cost about \$35,000. Albert Pergande is consulting engineer.

National Gauge & Equipment Co., La-Crosse, Wis., subsidiary of MotoMeter Co., Long Island City, N. Y., has broken ground for a two-story extension, 130 x 160 ft., and an addition to power house. A 50,000-gal. steel tank is being installed in connection with automatic sprinkler system. Improvements will cost about \$100,000.

Allis-Chalmers Mfg. Co., Milwaukee, is building a two-story addition, 60 x 115 ft., to administration building of tractor division of main works in West Allis, Milwaukee.

Minneapolis, St. Paul & Sault Ste Marie Railway, Minneapolis, is making surveys for improvements in round house, machine shop, coaling plant, and water tanks at Ashland, Wis. Replacement of considerable equipment is contemplated.

Mads Madsen, National Building, Minneapolis, Minn., is low bidder at \$164,997 for general work of erecting a new vocational training school, 120 x 150 ft., three stories and basement, at Green Bay, Wis. It will cost about \$300,000 complete. Shop equipment purchases probably will not be made until early in 1929. Architects are Foeller, Schober & Berners, Green Bay.

Bids close Oct. 23 with J. W. Purves, secretary Board of Education, Friendship, Wis., for a new two-story high school, 73 x 108 ft., including manual training department. It will cost about \$100,000. Architects are Smith & Brandt, Appleton and Manitowoc, Wis.

Lomira Mfg. Co., Lomira, Wis., manufacture of furniture and hardwood specialties, will build a new plant costing about \$75,000 to replace factory destroyed by fire on Sept. 18.

Chicago

CHICAGO, Oct. 8.—Tendencies in the machine tool trade are not as well defined as a week ago. Miscellaneous orders are more widely scattered and less numerous, but fresh inquiry is more active. Progress is slow on large lists.

The Chicago, Milwaukee, St. Paul & Pacific, is tabulating bids recently taken. Allis-Chalmers Mfg. Co., Milwaukee, is not yet ready to make known its exact needs and the A. O. Smith Corporation has not passed a formal appropriation for its machine tool requirements. An electrical equipment manufacturer in Chicago is making numerous replacements and is reported to have purchased a number of small lathes. A pump manufacturer in Iowa has ordered a 16-in. x 6-ft. lathe and a local builder of radio sets has purchased a 50-ton press. The Santa Fe will take prices on an 18-in. x 1½-in. double-wheel, motor-driven grinder for delivery to California.

Commonwealth Edison Co., 72 West Adams Street, Chicago, will build a sub-

station, 100 x 160 ft., on Prairie Avenue, to cost \$200,000 with equipment.

Pioneer Publishing Co., 1114 North Boulevard, Oak Park, Ill., will install power equipment in a four-story printing plant to cost more than \$250,000. S. N. Crowen & Associates, 22 West Monroe Street, are architects and engineers.

Iowa Railway & Light Co., Davenport, Iowa, will spend about \$200,000 on improvements in its power plant at Boone, Iowa.

Household Utilities Corporation, Twenty-second Street and Fifty-fourth Avenue, Cicero, Ill., will build an addition, 80 x 400 ft., to cost \$200,000.

Commercial National Bank, Waterloo, Iowa, has been appointed receiver of Litchfield Mfg. Co., Waterloo, maker of agricultural implements. Company will continue operations under receiver.

E. L. Essley Machinery Co., 557 West Washington Boulevard, Chicago, has been appointed district agent for Consolidated Machine Tool Corporation.

Standard Oil Co., 910 South Michigan Avenue, Chicago, has plans for one-story storage and distributing plant at Decatur, Ill., to cost about \$100,000 with equipment. Schlitz & Bailey, 53 West Jackson Boulevard, are architects.

Union Furniture Co., Eighteenth Avenue, Rockford, Ill., has awarded general contract to Holmquist-Peterson Co., Swedish-American Bank Building, for a three-story factory, 80 x 300 ft., to replace one recently destroyed by tornado, to cost over \$100,000 with machinery. Peterson & Johnson, Swedish-American Bank Building, are architects.

J. I. Case Threshing Machine Co., Eighth Street, Des Moines, Iowa, has engaged C. V. Johnson, Commonwealth Building, architect, to prepare plans for a four-story addition, 100 x 130 ft., to cost about \$85,000 with equipment.

Board of Trustees, University of Chicago, 189 West Madison Street, Chicago, will soon take bids for superstructure for new three-story and basement power plant, 100 x 110 ft. It will have initial capacity of 12,000 hp. Philip B. Maher, 157 East Erie Street, is architect.

Chrysler Corporation, East Jefferson Street, Detroit, manufacturer of automobiles, will build a one-story factory branch and distributing plant at Chicago, to cost about \$100,000 with equipment. Mundie & Jensen, 39 South La Salle Street, Chicago, are architects.

Board of Education, Minot, N. D., is considering installation of manual training equipment in three-story junior high school addition to cost over \$200,000, for which bids have been asked on general contract. Bugenhagen & Molander, Union National Bank Annex, are architects and engineers.

Cudahy Packing Co., Union Stock Yards, Chicago, will soon begin superstructure for four-story cold storage and refrigerating plant, 55 x 145 ft., at Sioux City, Iowa, to cost about \$180,000 with machinery.

Lakeside Railway Signal Co., Freeport, Ill., is completing plans for first unit of new plant at South Beloit, Ill., one-story 40 x 300 ft., to cost about \$100,000 with equipment.

Rapid City, Black Hills & Western Railway Co., Rapid City, S. D., has awarded general contract to Kepp Construction Co., local, for new locomotive house and machine shop, to cost about \$30,000 with equipment.

Cleveland

CLEVELAND, Oct. 8.—Machine tool business and inquiry continues good. Buying is well distributed although the automobile parts industry is showing more activity than other fields. The White Motor Car Co., Cleveland, will purchase considerable machinery to manufacture a new truck model which it will bring out shortly. Buying by automobile manufacturers in the Detroit territory has slowed down, but is expected to show more life when motor car builders effect plans to bring out new 1929 models. Turret lathes continue to move well in single orders from widely diversified industries. Buyers as a rule want quick deliveries, but a local manufacturer is unable to make shipments within six or eight weeks.

Union Chain & Mfg. Co., Sandusky, Ohio, maker of elevating, conveying and power transmission machinery, has acquired control of American High Speed Chain Co., Indianapolis, and subject to approval of stockholders, will combine. Indianapolis company manufactures complete line of silent or high speed chains, smaller pitch steel roller chain and sprockets and lines of two companies will supplement each other. With approval of stockholders, machinery and equipment of American company will be removed to Sandusky, a new unit having been provided. J. C. Howe, president, and W. A. McCosh, vice-president of American company, will become part of new organization, officers of which will be Fred Emmons, president and treasurer; J. C. Howe and Walter Hay, vice-presidents, and E. F. Emmons, secretary.

Uniflow Stoker Corporation, Sidney, Ohio, has been organized to manufacture power stokers for 50 to 200-hp. boilers and Turner domestic stokers. It is reorganization of Uniflow Stoker Co., formerly at Piqua, Ohio, which has been recapitalized and removed to new factory at Sidney. Company is in production and also manufactures all parts.

Cleveland Planer Co., 3148 Superior Avenue, Northeast, Cleveland, has purchased good will, patents, drawings, patterns, jigs, fixtures and rights to manufacture and sell Emco W bench power punch press, formerly built by Enterprise Machine Tool Co., Chicago. Cleveland company expects to build presses in quantity to be carried in stock for prompt shipment and will also be in position to furnish repair parts.

City Ice & Fuel Co., 6611 Euclid Avenue, Cleveland, is considering one-story ice-manufacturing plant at Willoughby, Ohio, to cost about \$200,000 with machinery.

General Tire & Rubber Co., Akron, Ohio, is said to be planning an expansion program to increase capacity about 50 per cent, to cost over \$1,000,000.

Fred W. Mettler, Union Mortgage Building, Cleveland, architect, has awarded general contract to Vokes Construction Co., same address, for two-story automobile service, repair and garage building, and bus terminal 120 x 220 ft., to cost about \$160,000 with equipment.

City Council, Zanesville, Ohio, has authorized fund of \$60,000, for establishment of municipal airport, including hangar, with shop and repair facilities, oil storage and other units.

Goodyear Tire & Rubber Co., Akron, Ohio, has awarded general contract to Hunkin-Conkey Construction Co., Hunkin-Conkey Building, Cleveland, for a

five-story addition, 200 x 600 ft., to cost more than \$750,000 with equipment. Portion of structure will be used for storage and distributing. Further expansion is said to be under consideration.

Forest City Walworth Run Foundries Co., 2500 West Twenty-fifth Street, Cleveland, has awarded general contract to Sam W. Emerson Co., 1836 Euclid Avenue, for four-story foundry and distributing unit to replace part of plant lately damaged by fire, to cost over \$70,000 with equipment.

Van Huffel Tube Corporation, Warren, Ohio, manufacturer of steel tubing, has purchased former plant of Sterling Knight Motor Co., Youngstown, for expansion.

Gears & Forgings, Inc., Cleveland, will enlarge its gear making departments by a three-story building, 72 x 72 ft.

Cincinnati

CINCINNATI, Oct. 8.—The first week of October has brought no signs of a let-down in machine tool buying, which has been at about the same rate as in September. While the automobile industry continues the largest source of machine tool business, several builders state that orders have been even more diversified than in recent weeks. Unfilled orders have accumulated to such an extent that many companies are having difficulty in making early deliveries. Production is holding up to high levels and in some cases plants have scheduled extra shifts to speed output.

An automobile maker in the Detroit district has bought six automatic lathes, while a manufacturer of airplane engines has contracted for four large engine lathes. Foreign business has been of somewhat greater proportions in the past few weeks, outstanding transactions including five rapid production lathes for delivery to Czechoslovakia and four lathes for shipment to Holland.

Board of Education, Marietta, Ohio, is said to be planning installation of manual training equipment in addition to high school, to cost about \$130,000. Garber & Woodward, 4 West Seventh Street, Cincinnati, are architects.

Black-Clawson Co., Second and Vine Streets, Hamilton, Ohio, manufacturer of pulp and paper mill machinery, has acquired adjoining property and contemplates expansion.

City Council, Middlesboro, Ky., is said to be planning installation of a municipal electric light and power plant. A city waterworks is also proposed.

Board of Education, Louisville, is reported planning installation of manual training equipment in new three-story and basement high school, to cost \$375,000, for which bids have been asked on general contract. J. M. Colley is architect.

Air Corps, Material Division, Wright Field, Dayton, Ohio, is asking bids until Oct. 17 for couplings and dies, circular 137; for 100 intake wrenches, disks and pointers, circular 138; until Oct. 16 for 12,000 ferrules and electric terminals, circular 139, and 115,000 hose clamps, circular 142.

Lewis Mfg. & Supply Co., Louisville, manufacturer of kitchen equipment, has leased for new plant a factory to be erected at Brook and Bloom Streets, to cost about \$30,000.

Prest-O-Lite Co. and Linde Air Products Co., 30 East Forty-second Street,

New York, affiliated organizations, have awarded general contract to W. W. Wessell, 388 North Front Street, Memphis, Tenn., for new local plants, each one-story 58 x 86 ft., to cost about \$70,000 with equipment.

Stanton Motor Co., Broad and Grant Streets, Columbus, Ohio, has leased a building to be erected on local site, to cost about \$100,000 with equipment, for new service, repair and garage building. Richard, McCarty & Bulford, 584 East Broad Street, are architects.

Indiana

INDIANAPOLIS, Oct. 8.—Cyclone Fence Co., Greensburg, is reported planning one-story addition to cost over \$40,000 with equipment. Headquarters are at Waukegan, Ill.

Hayes Body Corporation, Grand Rapids, Mich., has purchased plant at 1231 West Morris Street, Indianapolis, formerly operated by Murray Body Corporation, Detroit. New owner will continue production and plans output of about 100 bodies daily.

Link-Belt Co., Holmes Avenue and West Michigan Street, Indianapolis, has awarded general contract to Latham & Walters, Empire Life Building, for three-story addition, to cost \$150,000 with equipment. Headquarters are at 910 South Michigan Avenue, Chicago.

City Council, Shelbyville, is considering establishment of municipal airport, with hangars, repair and reconditioning shops, oil storage and other units, to cost over \$50,000.

New Albany Machine Mfg. Co., New Albany, has purchased patents and right to manufacture sheet metal-working machinery, formerly owned by J. M. Robinson Mfg. Co., Cincinnati. Jigs and inventory are now being transferred to New Albany plant, East Tenth and Water Streets.

St. Louis

ST. LOUIS, Oct. 8.—Parks Aircraft, Inc., St. Louis, recently organized by Russell E. Gardner, head of Gardner Motor Co., Main and Rutger Streets, and associates, is planning construction of new works, with parts and assembling divisions, at East St. Louis, Ill., to cost more than \$150,000 with equipment. Harry P. Mammen is president.

Benjamin S. Lang, St. Louis, care of W. S. Frank, Security Building, architect, has plans for three-story and basement automobile service, repair and garage building, 70 x 175 ft., to cost more than \$100,000 with equipment.

Houston Oil Co., Houston, Tex., has plans for a new storage and distributing plant at Herbert, Ark., to cost over \$50,000 with equipment. Company will also improve oil refinery and install additional equipment.

Kansas Power & Light Co., Atchison, Kan., will remodel building at Tenth and Main Streets for a new machine shop and motor bus service and garage unit. A hydraulic lift and other equipment will be installed.

General Tool Co., Enid, Okla., is considering new one-story plant 75 x 135 ft., to cost about \$40,000 with equipment.

Peoples Sugar Co., Moroni, Utah, is reported planning new beet sugar mill near Cozad, Neb., to cost about \$500,000

with machinery. Project includes power house and machine shop.

C. H. Walbert, Penn and Thirty-ninth Streets, Oklahoma City, Okla., and associates are planning construction of new ice-manufacturing plant at Tulsa, Okla., to cost about \$100,000 with equipment.

Meginnis & Schaumburg, Federal Trust Building, Lincoln, Neb., architects, have plans for a three-story automobile service, repair and garage building, 50 x 140 ft., to cost more than \$100,000 with equipment.

Empire Gas & Fuel Co., Bartlesville, Okla., has plans for a pipe line from its properties in Mid-Continent field to a point near Chicago, about 450 miles, and contemplates a new oil refinery at northern terminus, with capacity to handle about 10,000 bbl. of crude oil per day. Project will cost more than \$1,500,000.

Standard Steel Works, North Kansas City, Mo., H. J. Bornstein, head, has plans for one-story storage and distributing plant, 100 x 115 ft., with shop facilities, to cost about \$60,000.

Gulf States

BIRMINGHAM, Oct. 8.—Plans have been filed by Houston Lighting & Power Co., Houston, Tex., for a one-story equipment storage and distributing plant, with automobile service and garage facilities, 168 x 370 ft., to cost about \$250,000.

United States Cast Iron Pipe & Foundry Co., Birmingham, is carrying out an expansion program at North Birmingham, including a new unit for producing pipe 4 to 12 in. diameter, 18 ft. long.

Birmingham Electric Co., Birmingham, is disposing of bond issue of \$3,000,000, part of fund to be used for expansion and betterments.

Central Power & Light Co., Frost Building, San Antonio, Tex., is reported planning new hydroelectric power plant in Maverick County, to cost about \$200,000 with transmission line.

Buick Motor Co., 1420 Young Street, Dallas, Tex., main plant at Flint, Mich., has awarded general contract to Rife Construction Co., Dallas, for three-story factory branch, service and repair building, 95 x 150 ft., to cost about \$130,000 with equipment.

Louisiana Public Utilities Co., Lafayette, La., will rebuild part of generating station at Oakdale, La., destroyed by fire Oct. 1, with loss of about \$120,000 including equipment.

Board of City Commissioners, Palmetto, Fla., will receive bids until Oct. 22 for equipment for electric light and water-works station, including Diesel oil engine with direct-connected alternator and accessories; pumping machinery, switchboard, piping, valves and auxiliary equipment. Main Engineering Co., 112 Baker Street, Daytona Beach, Fla., is engineer.

Stamford Independent School District, Stamford, Tex., has authorized construction of one-story manual training school, 55 x 115 ft., to cost about \$30,000 with equipment. David S. Castle Co., Alexander Building, Abilene, Tex., is engineer.

Great West Pipe Line Co., Big Springs, Tex., recently organized by Reese S. Allen, City National Bank Building, Wichita Falls, Tex., and associates, is arranging for construction of new oil refinery at Big Springs, with pipe line from Chalk Roberts oil field, Howard County, to refinery. Plant of Interstate

Gasoline Co., Iowa Park, Tex., has been acquired by Great West company and part of equipment will be removed to new plant. Project will cost more than \$500,000. Mr. Allen is now operating oil refineries at Amarillo, Tex., and other points.

Board of Education, Montgomery, Ala., contemplates installation of manual training equipment in two-story and basement high school in Capitol Heights section, to cost about \$200,000 with equipment. Frederick Ausfield, Shepherd Building, is architect.

Following completion of first unit of new steam-operated electric power plant at Lake Pauline, near Quanah, Tex., scheduled for this month, West Texas Utilities Co., Abilene, Tex., plans installation of two additional units with capacity of 40,000 hp., making total of 60,000 hp.

Libbey-Owens Co., Toledo, Ohio, has purchased plant of United States Sheet & Window Glass Co., Shreveport, La., and other assets for price of \$6,400,000. New owner is considering extensions and improvements in Shreveport mill and installation of equipment to manufacture laminated glass.

City Council, Denton, Tex., is planning extensions in municipal power plant and additional generating and pumping machinery, to cost about \$30,000. J. P. Greenwood, Allen Building, Dallas, Tex., is engineer.

Canada

TORONTO, Oct. 8.—Machine tool business in this market for the past week was practically on a par with that of recent weeks. Some inquiry is coming out in which lists from a half-dozen to a dozen tools are involved, but the bulk of orders is for single tools. Wood-working tools are in strong demand from lumber plants and wood-working shops.

Chrysler Motor Co., has secured 70 acres at Windsor, Ont., and will start work immediately on erection of buildings to manufacture Chrysler, De Soto, Fargo and Plymouth cars and trucks. Plant will cost \$1,500,000 and is expected to be completed in January.

Canadian Steel Corporation, Ltd., Ojibway, Ont., is installing equipment to manufacture electrically welded wire mesh for concrete reinforcing. It is also installing equipment to manufacture wire fence and fence posts.

G. G. McKeough, 329 Wellington Street West, Chatham, Ont., is completing arrangements for erection of a new machine shop.

Arthur Jackson Machine Tool Co., Toronto, has moved into its new and larger offices and warehouse at 9 Front Street, East.

Pyramid Paper Products, Ltd., East Angus, Que., is having plans prepared by J. W. Gregoire, 86 Wellington Street North, Sherbrooke, Que., for a factory to cost \$40,000. It will be one story, 40 x 280 ft.

Bids are being received (no closing date set) by S. McPhie, architect, Sun Life Building, Hamilton, Ont., for a \$25,000 addition to plant of Wallace Barnes Co., Ltd., 274 Sherman Avenue, West, Hamilton, Ont., manufacturer of flat, coil, phosphor bronze, and steel wire springs, etc. It will be two stories and basement, 60 x 120 ft.

National Steel Car Corporation, Ltd., Kenilworth Avenue, Hamilton, Ont., will

start work immediately on addition to cost \$25,000.

Sangamo Electric Co., of Canada, Ltd., 183 George Street, Toronto, is having plans prepared by Chapman & Oxley, Northern Ontario Building, for two-story addition, 40 x 110 ft.

Bids will be called this month for four-story addition, 150 x 400 ft., to plant of Hinde & Dauch Paper Co. of Canada, Ltd., 45 Hanna Avenue, Toronto. R. Cook is engineer.

Godson Contracting Co., Ltd., 203 Richmond Street, West, Toronto, will start work soon on erection of a one-story machine shop, 34 x 125 ft.

Gray Ball Bearing Co., 686 St. Clarens Avenue, Toronto, has let general contract to Wells & Gray, Ltd., Confederation Life Building, for one-story plant to cost \$25,000.

City Council, Charlottetown, P. E. I., contemplates construction and installation of electric light and power plant.

Western Canada

Victoria Cold Storage & Terminal Co., Victoria, B. C., has awarded contract to Luney Brothers, Sayward Building, Victoria, B. C., for a five-story cold storage plant, 110 x 120 ft., at Ogden Point to cost \$400,000.

Bids are being received by chairman of Committee on Public Utilities, Winnipeg, until Nov. 19 for delivery at Slave Falls, Man., of equipment and supplies to be used in power development plant under construction, including two 10,000-kva., generators and two 450 kva. generators with accessories and spare parts; also erection of five spillway gates, four sluice gates, and stop logs, etc. Plans and specifications with Winnipeg Hydro Electric Commission, 55 Princess Street, Winnipeg.

Pacific Coast

SAN FRANCISCO, Oct. 4.—Plans are under way by Emsco Aero Engine Co., Los Angeles, E. M. Smith, president, for new plant on eight-acre tract at South Gate, near Los Angeles, to cost about \$200,000 with equipment.

Fibreboard Products, Inc., Antioch, Cal., has awarded general contract to Barrett & Hilp, 918 Harrison Street, San Francisco, for new one-story and basement mill, to cost over \$80,000 with equipment. Laland Rosener, 233 Sansome Street, San Francisco, is engineer.

In connection with expansion program at its motion picture studios, Fox Film Corporation, Los Angeles, plans installation of power equipment and electrical machinery to cost more than \$1,500,000. Entire program will include group of 25 buildings at Westwood to cost about \$8,000,000.

Board of Education, Los Angeles, has authorized construction of a one-story vocational shop unit with new high school group on Santa Barbara Avenue, to cost \$350,000. Architectural Division, 1445 South San Pedro Street, is preparing plans.

Premier Bed & Spring Co., 5700 Third Street, San Francisco, has filed plans for one-story addition to plant, to cost over \$50,000 with equipment.

Wenatchee-Beebe Orchard Co., Clarks-ton, Wash., is planning construction of new cold storage and refrigerating plant to cost about \$70,000 with equipment.

American Can Co., 120 Broadway, New York, and Hunter-Dulin Building, San Francisco, is said to be planning new works at Pittsburg, Cal., for manufacture

of tin cans and other containers, to cost more than \$175,000 with equipment.

Ventura Union High School District, Ventura, Cal., plans construction of one-story vocational shop with new junior high school group, for which bonds for \$400,000 have been approved. Austin & Ashley, Chamber of Commerce Building, Los Angeles, are architects.

Board of Education, Inglewood, Cal., plans construction of one-story vocational shop with new high school group on Rosecrans Avenue to cost about \$400,000. T. C. Kistner & Co., Architects' Building, Los Angeles, are architects.

Century Electric Co., St. Louis, has removed its Spokane, Wash., office to 709 Hutton Building, Sprague and Washington Streets.

Jamison Steel Co., Los Angeles, will be located in its new warehouse at 1320 Santa Fe Avenue on Nov. 1.

Jones & Laughlin Steel Corporation, Pittsburgh, has closed its branch office in Smith Building, Seattle, which was in charge of Jesse K. Barker, general sales manager.

Foreign

CONTRACT has been let by Segura & Jugar Hydroelectric Development Co., Madrid, Spain, to Fox Brothers International Corporation, 33 Rector Street, New York, for five hydroelectric power plants, each with capacity of 20,000 kw., on Segura and Jugar Rivers, southeastern Spain, with transmission lines for service in mining districts in vicinity. About 40 per cent of output will be used later by Spanish Government for electrification of railroads in that territory. Project is reported to cost about \$2,000,000.

Increase in Petroleum Output

Production of crude petroleum in the United States in August was 77,829,000 bbl., a gain of about 3 per cent over July, when the total was 75,426,000 bbl. There was a falling off, however, in the aggregate production of the first eight months, which amounted this year to 588,548,000 bbl., compared with 598,242,000 bbl. last year.

New September Record in Building Contracts

Construction contracts in September in the 37 States east of the Rocky Mountains are reported by F. W. Dodge Corporation at \$587,674,000. This is the largest figure ever recorded in September. It is 13 per cent ahead of September, 1927, and 14 per cent ahead of August, 1928. It brought the total amount for the first nine months to \$5,132,944,000, an increase of 7 per cent over the first nine months of 1927.

Residential construction still holds the first position in volume, at \$202,807,000, or 35 per cent of the total. This percentage has been dropping from 40 or more, earlier in the year. Public works and utilities accounted

Plans are said to be under way for organization of a company to develop low grade manganese properties near Santiago de Cuba, headed by Howard Trumbo, American resident at Havana, Cuba, inventor of process for transforming such material into commercial concentrates; A. E. Smith, comptroller Electric Bond & Share Co., 2 Rector Street, New York; J. D. Lannon, vice-president American Radiator Corporation, 40 West Fortieth Street, New York; Martin O'Mara, president Brockway Motor Truck Co., Cortland, N. Y., and others. It is purposed to construct plant with milling capacity of about 1000 tons per day, to cost over \$750,000 with machinery.

An automobile company at Sao Paulo, Brazil, has purchased property south of city, as site for an automobile plant, including parts manufacture and assembling. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference Brazil No. 288445.

Compania Hispano Americano de Electricidad, known as "Chade," Buenos Aires, Argentina, is arranging for early sale of capital stock in United States, representing portion of recent increase in capital of 60,000,000 pesetas (about \$11,580,000), fund to be used in part for expansion in power plants and system. Company has work under way on new central generating plant with capacity of 85,000 kw., including additional transmission lines and power substations. Arturo Dunzelmann is manager.

A municipality in State of Sao Paulo, Brazil, is asking bids until Nov. 30 for pumping, power and other equipment for municipal waterworks and sewage systems. Information at office of Industrial Machinery Division, Department of Commerce, Washington, reference Brazil No. 287887.

for \$119,014,000, industrial buildings for \$114,780,000, commercial buildings for \$60,068,000, educational buildings for \$38,800,000 and hospitals and institutions for \$23,846,000.

Lower construction during the remainder of the year is indicated by a drop of 15 per cent in the value of projects contemplated but not yet let. The total, at \$522,656,000, is also 17 per cent less than in September, 1927.

Motor Truck Output May Break 1925 Record

Predicting the continuance during the remaining months of 1928 of the high motor truck production which has marked the first eight months, A. J. Brosseau, chairman motor truck committee National Automobile Chamber of Commerce, foresees the possibility of 1928 equaling, if not surpassing, the record year of 1925.

"The National Automobile Chamber of Commerce figure of 66,795 trucks produced in the United States and Canada in August sets a new high mark for the production of trucks in any month since the beginning of the industry," Mr. Brosseau said. "The previous high mark of 61,185 was set in September, 1925. This high production continues the movement which began in May and which character-

ized the early summer months of this year.

"The accelerated production in mid-year has resulted in a total of 377,954 trucks produced to Sept. 1, compared with 358,234 during the same period last year and 346,528 produced during the first eight months of 1925, the truck industry's record year. In 1925 a total of 531,628 trucks were produced, due chiefly to a well sustained production toward the end of the year. Production was also continued at a good level toward the end of 1926, when a total of 529,920 trucks were produced. The rather marked reduction in the output of trucks during the last quarter of 1927 carried the total for that year below the half million mark for the first time since 1924."

Slight Increase in Shipments of Railroad Locomotives

Shipments of locomotives in September totaled 41, compared with 34 in August, which was the lowest number for many years. The September total was less than one-third that of September, 1927, when 127 units were shipped. Twenty-eight of the 41 are steam locomotives for domestic use and two are electric units on domestic order. The remaining 11 are steam engines for export.

During the first nine months shipments totaled 435, against 838 in the corresponding period of 1927. Steam and electric units for domestic use this year numbered 285 and 87 respectively, against 573 and 116 last year. Steam and electric units for export numbered 61 and 2 this year, against 136 and 13 last year.

Slight Increase in Industrial Coal Stocks

Stocks of anthracite and bituminous coal in the United States in the hands of industries on Sept. 1 are estimated by the National Association of Purchasing Agents at 40,090,000 tons, a gain of 1½ per cent from the 39,415,000 tons Aug. 1. This is the first upturn of the curve since last October. The average stocks are estimated as equivalent to 37 days' supply at current consumption rates, an increase of one day during the month. Steel mills are estimated to have 33 days' supply, railroads 33 days' supply, by-product coke plants 23 days, electric utilities and coal gas plants 55 days and other industries 36 days.

Industrial consumption during August is given as 33,890,000 tons, a gain of 1 per cent over July and the highest figure since last May. Production in August was 48,598,000 tons, a gain of 16 per cent over July, and the highest figure since last March.

The Technology Club, Syracuse, N. Y., will celebrate the twenty-fifth anniversary of its founding with an all-day program, Oct. 15, ending with a banquet in the evening.

Gates and Risers for Good Castings

How Their Proper Arrangement Avoids Many Troubles—Methods of Skimming Slag and Filling Mold

BY PAUL R. RAMP*

GATES and risers are to a mold what food is to our bodies. Proper food means a good, healthy body free from aches and pains and a smooth skin with no imperfections on the surface. Proper gates and risers mean good castings free from blow holes, sand, slag and shrink cavities, with a smooth, clean surface. It is true that we can produce a defective casting even though we have the gates and risers properly made; but it is also true that we can have our bodies in perfect health and break a limb or lose an eye. A healthy body or a properly gated mold represents 75 per cent of the battle won. For this reason I believe too much cannot be said about gates and risers and their influence on the quality of the casting produced.

A foundry engineer, when designing molding equipment for quantity production of castings, considers first where and how he is going to gate the mold; where he is going to

place the risers or feeding heads (riser is often called feeding head). After he has settled this question he is ready to consider other details, such as parting the mold, holding the cores in place and carrying off the gas. He decides upon the gates and risers first, because they are the most important.

In the job shop where the work varies from day to day the molder must make his own gates and risers, and decide where they are to be placed and the kind he must use. Consequently it is very important that he should have a thorough knowledge of the subject. It is the author's intention to give as much information as possible that will help him decide on his plan of gating and feeding the many different molds that he makes.

All of the metal entering the mold must pass through the gate; consequently the gate must receive the same attention that is given the mold. The sand must be as well mixed; the escape of the gas must be provided for. As there is more danger of a gate cutting than of a mold cutting, the gate must be surrounded with the same facing sand that is rammed around the pattern. Just as much care

*Superintendent of foundry and pattern shop, Newport News Shipbuilding & Dry Dock Co., Newport News, Va. This is a portion of a lecture delivered by Mr. Ramp to a class of foundry apprentices.

SECTION of Mold for a Face Plate, Showing Method of Gating and Character of Riser to Produce Best Results. The way the slag is skimmed off, by a combination of a choking effect at C and provision for its reception at B, is particularly effective

must be used in ramming around the gate as in ramming around the pattern.

To prevent any impurities from entering the mold with the metal, the pouring gate must be kept full during the pouring process. As this cannot be done if the gates are too large, it is good practice to choke the flow somewhere between the ladle and the mold.

These are things that the molder must always have in mind in making his gates and risers.

Gating a Face-Plate Mold for an Iron Casting

A CROSS-SECTION of a mold for a face plate is shown in the first illustration. This casting must be very clean and free from dirt or slag. A single skim gate is used on this mold; if it is properly made, and the gates are kept full during the pouring, a clean casting will be produced.

Hot metal is poured from the ladle through the pouring gate at A. The first metal must be poured very quickly,

the same time it must be remembered that if the small gate, or channel, that extends from the choke to the mold is too long, there is danger of the metal in this channel chilling, thus closing the inlet gate entirely.

The surface of the basin at E must be soft enough to prevent the metal from cutting into it. The same applies to the basin F directly under the skimmer. Also, the gate surface between these two points must be soft, because the metal flowing over this area will cut if the surface is hard, and produce more dirt than can be carried off by the skimmer.

A side riser, D, is used on this mold, with a fillet at G where the riser is connected with the mold. This fillet is provided to prevent the riser from breaking into the casting when it is removed. The riser cover H should be made of cast iron heavy enough to fit snugly over the riser. The function of the riser cover is to prevent air from rushing from the mold through the riser.

GATES and Risers for a Mold Used in Making a Hammer Die Block: This shows the same method for getting rid of the slag as in the illustration on the preceding page. The riser, however, here rises above the center of the casting, instead of being led off at one end

so as to choke the stream of metal at C. When the progress of the metal is retarded at C, the level rises in the skimmer toward B. All the metal that follows must be poured fast enough to keep the skimmer at B full. When the metal is running into the mold in this manner, the slag and other impurities automatically rise to the top, while the heavier metal flows beneath it into the mold.

Care must be used in preparing the choke gate at C. It must be sufficiently large to allow the metal to flow fast enough to run the mold and avoid cold-shuts, and it must be small enough to produce a head of metal in the skimmer at B. The choke point shown at C must be abrupt and not tapered. A tapered gate produces a nozzle effect on the stream of iron and, with a nozzle-shaped gate, dirt or slag may be forced into the mold, regardless of the skimmer.

At the point where the metal enters the mold, indicated by I, a small quantity of impurity may be stopped, but there is always danger of dirt being forced into the mold if it gets as far as I. For this reason it is safer to choke a gate as far away from where it enters the mold as possible. At

A current of air is produced by the metal forcing the air out of the mold as it fills; it often blows off corners and projections in the mold and produces a dirty casting. With the riser cover properly sealed, the air in the mold is compressed and acts as a support to the cope, or top mold surface, until the metal reaches it. Without this air support, it is not unusual for the upper surface of a mold, directly over the riser metal, to blister and drop off into the mold and produce a dirty casting. This blister is commonly called a "burn down."

After a riser cover is placed in position on the mold, sand should be tucked around the outer edge to seal the joint between the top of the mold and the riser cover, to guard further against the escape of air.

Bottom Pouring Gate

CROSS-SECTION of a die block mold is shown in the second illustration. This die block, a heavy piece of iron, must be free from slag and sand holes and shrink cavities when casting. The pouring gate shown at A, working in

HORN Gate for a Gear Mold, Used to Avoid Damage to the Molded Teeth. Here the pouring basin is large enough to take care of slag. The riser leads from the heavy hub section. Metal from the gate flows outward in all directions from the hub

conjunction with skimmer *E* and the choke shown at *C*, will, if the metal is properly poured, produce a casting free from slag.

The bottom pouring gate leads the metal from *C* to the mold, which it enters at *D*. This mold is gated at the bottom because the fall of the metal to the joint of the mold, at the bottom, would be so great that the hot iron would be likely to cut into the surface of the bottom and produce sand holes in the casting.

In this case the single skim gate and choke at the joint prevent slag holes, and the bottom pouring gate prevents sand holes. The skim gate at the joint would not insure a clean casting without the bottom pouring gate, because the

falling metal would cut the mold and produce sand holes. The bottom pouring gate, without the skim gate on the joint, would not insure a clean casting, because there would be danger of slag entering the mold. This is why a mold of this kind should be poured with the skim gate and bottom pouring gate combined.

Metal enters the gate at *A* and drops on the soft basin at *B*. The stream is choked at *C*, causing the slag to rise in the skimmer *E*, after which the metal proceeds to the mold through the bottom pouring gate. The usual care must be used in making the basin *B* and the channel to *C* soft enough to prevent cutting.

The space between the bottom pouring gate and the

Section A-A

Section B-B

DDOUBLE Skim Gate for Mold for Two Driving Box Shoes for Locomotive. Slag skimmers at *G, G*, and four inlet gates, feature this mold. A single riser serves both castings

mold proper, indicated by *F*, must be supported by rods to prevent its collapse before the mold is filled. This same space must be well vented, to prevent a scab or cut on the surface of the mold opposite the gate. This will occur if gas is confined between the bottom pouring gate and the mold.

The riser is covered to hold the air pressure against the upper surface of the mold and thus prevent a burn-down. Fillets are provided where the riser connects with the mold at *GG*, to prevent the riser from taking a piece out of the casting when it is broken off. This plan of gating should be applied to all molds for heavy, chunky castings, where the metal must fall some distance on the surface of the mold.

Horn Gates

THE third sketch is a cross-section of a mold for a spur gear. In pouring a mold of this kind, the metal must enter at a point where it will not damage the teeth that

flows through the horn gate, under one section of the mold and into the bottom of the hub at *E*. From there it rises and flows over the web surface gently to the point indicated by *FF*.

After the mold is filled, the metal rises to the top of the cope through the riser. A riser cover should be used in a mold of this character, as the current of air produced by the metal entering the mold is likely, otherwise, to blow down the delicate columns of sand that produce the gear teeth.

The horn gate must not be too close to the bottom of the mold it is passing under. In such a case there would be danger of the gate's breaking into the mold directly above it, or confined gas causing a cut or a blow in the bottom surface of the mold.

Mold for Locomotive Driving Box Shoes

FOUR cross-sections of a mold for locomotive driving box shoes are shown in the fourth illustration. In this

GLOBE Valve Mold with Three Cores. This is a horizontal section through the mold, the metal being poured in at *A* and slag skimmed off at *B*. Especial care of surfaces at *G* and *H* is required in this type of casting

are formed in the sand. To pour it directly into the hub from a pouring basin would be dangerous, because the metal would splash and strike some of the delicate sand teeth. The best and safest plan is the use of a horn gate as shown here.

Hot metal enters the pouring basin at *A*. The bottom of this basin must be soft enough to prevent the metal from cutting, and a little lower than the point where the metal leaves the basin and enters the down-gate *B*. This is done to provide a cushion of metal in the bottom of the pouring basin for all the metal that follows to fall on. If this cushion of metal were not provided, the bottom of the basin would be cut away by the action of the metal before many pounds had flowed through the basin, and a quantity of the sand cut away in this manner would find its way through the down-gate to the mold.

The metal proceeds through the down-gate to the inlet gate, which connects with the horn gate and is choked at the point indicated by *C*. It is also choked at the point *D*, where the inlet gate connects with the horn gate. The metal

case two castings are made in one flask and a double skimming gate is used. These castings are machined on all sides and must be free from sand or slag. The double skimming gate is necessary to take care of the impurities properly.

Section *B-B* shows how the metal enters the gates. It is poured in at *D* and falls to basin *E*, from which it flows to *F-F* and rises in the two skimmers *G-G*. The plan of the cope is shown above section *B-B*.

Section *A-A* shows the four inlet gates, which are very small, to choke the metal. In the plan above section *A-A* the location of the two skimmers *G* and the pouring gate *D* can be seen, and the inlet gates also. These inlet gates are located so that the metal will drop to the bottom of the flanges and fill these flanges first, to prevent the surface at the flanges from being cut by the metal. When metal flows over a bare surface it is likely to scab and create a dirty casting. The plan should always be to have metal falling upon metal as early as possible in the pouring operation.

The inlet gates should be small enough to choke the

metal as it passes *G*, shown at left, and cause the skimmer to fill immediately. The riser is shown in the cross-section *A-A* and in the plans. Further to insure a clean casting, the riser must be covered during the pouring operation.

This plan of gating with the double skimmer and the proper size inlet gates will produce a clean casting, provided the facing is correctly mixed and the mold is clean before it is poured. The skimmer at *G-G* must always be at least 50 per cent larger than the pouring gate *D*. This makes it easier for the impurities to rise to the surface of the skimmer.

A single skim gate, as was shown in the first illustration, would not be practical when molding two of these castings in one flask, as one of the castings would be located too far from the single skimmer and there would be danger of dirt being collected between the skimmer and the casting. In all cases it is advisable to have the skimmer reasonably close to the mold.

Drag Section of a Globe Valve Mold

THE drag section of a globe valve mold shows how the double skimmer should be used in gating this type of mold. Metal entering the pouring gate *A* flows, as indicated by the arrows, to the two skimmers *B-B*. Here the metal is choked at *C*, where it enters the inlet gates and flows into the mold at *J-J*. This plan is the best method for gating globe valves; it not only insures a casting free from slag but also free from sand holes. The casting will be free from slag because the method of gating with the double skim gate will make it impossible for the slag to enter the

mold. If the skimmers are kept full during the pouring process the casting will be free from sand holes, because the metal dropping into the flanges from the side of the mold indicated will not cut or damage the surface of the mold.

The mistake made by many molders who have worked at the business for years is to gate castings of this character at the points of the mold indicated by *D* or *E*. This is done to enable them to use a smaller flask. But it is false economy, as a number of castings rejected on account of sand holes caused by the gates being located at these points will increase the cost more than the use of a larger size flask. The reason the gates that enter the mold at *D* or *E* produce dirty castings is that the sand pockets marked *F* are completely surrounded by the metal and the gates prevent free escape for the gas from these pockets. A frequent result is that the surface of these pockets, at *G-G* and *H-H*, scab and cut, and the loose sand that cuts off from them is found later on the surface of the casting.

In making a double skim gate for a globe valve, care must be taken not to have the space too small between the pouring gate and the edge of the mold proper. If this point is not given consideration, there is always danger that the pouring gate will break into the mold at the point indicated by *K*. Another danger of having the pouring gate too close to the mold, even though the gate does not break in, is that, when it is too close, it is difficult for the gas to escape, and there is a possibility of a scab on the mold, directly opposite the pouring gate.

(To be continued)

Where Our Finished Steel Exports Go

United States Ships Less Than Certain Other Countries;
Distribution Is World-Wide

POINTING out that while the United States ranks first in steel production of the world, but is fifth in the volume of steel exports, Luther Becker, chief of the Iron and Steel Division, Department of Commerce, sketched the distribution of American steel in addressing a group session at the formal opening early in October of the department's new district office in Pittsburgh. As a steel exporting nation, Mr. Becker said, the United States is surpassed by France, Germany, Great Britain and Belgium-Luxemburg, in the order named. Of these France, the greatest distributor of steel today, sold 2,300,000 tons in foreign markets in the first half of this year, Germany and Great Britain each but 150,000 tons less, and Belgium-Luxemburg slightly less than 2,000,000 tons. The United States trade over this period, it was stated, totaled 1,350,000 tons, with export sales increasing.

"These figures do not present quite the true picture of this relationship, however, for whereas virtually all of the exports of the United States go to non-European areas, a good part, if not the bulk of the sales, of those countries which exceed the United States are among themselves. Belgium supplies sheet bars to Great Britain and receives finished black and galvanized sheets in return, and so on. Further, these figures do not reveal the tremendous pressure which extensive excess capacity brings to bear on the European steel maker, and which make export sales of his steel a vital necessity. It is not exaggerating to say that France must export between 40 and 60 per cent of her output to utilize her present capacity effectively and economically, Germany and Great Britain from 20 to 35 per cent, and Belgium-Luxemburg from 60 to 75 per cent."

After stating the production of steel of the various pro-

ducing countries, Mr. Becker declared that, with one exception, tin plate is the principal steel product exported from the United States, this trade in 1927 having totaled 254,000 tons. Although we are the largest producer in the world of tin plate, it was pointed out, our exports of this product are exceeded by those of Great Britain. Being without such colonial markets as Great Britain enjoys in India, Australia and South Africa, the United States sells tin plate in virtually every country of the world.

"American rails found almost as wide employment in foreign lands, the 178,000 tons exported last year having been laid down at points as widely separated as Belgium and Mozambique and Canada and Uruguay," said Mr. Becker. "American rails grooved for street railway use carry the street cars of Spain, light rails climb the slopes of the Chilean Andes, linking mines with seaports, and heavy rails have gone into Manchuria, aiding in the development and industrialization in progress there under Japanese direction.

"Black and galvanized sheets are two other leading items of our export trade, export sales of each having aggregated approximately 150,000 tons last year. Galvanized sheets, however, find wider range than black steel sheets, the markets for the latter being frequently those in which galvanizing plants are already set up. American galvanized sheets were imported, during 1927, into Iceland and, although not braving the blasts from Greenland's icy mountains, they did feel the torrid heat of India's coral strand. They sheltered blacks in the Congo and Liberia, yellow men of China and Mongolia, brown men of Malaya and the East Indies, as well as whites throughout Europe, America and South Africa."

Gear Manufacturing Methods Discussed at Buffalo Meeting

LARGE attendance and active participation in a program of broad scope marked the fall meeting of the American Gear Manufacturers Association, held at the Hotel Statler, Buffalo, Oct. 11, 12, and 13. Problems met in the production of high-speed gearing were reviewed, and data on new facilities for finishing and testing gears reflected further advance in gear manufacturing methods. There was also a paper on the advantages of arc welding as a manufacturing tool.

Although no recommended practices were presented for adoption by the association, progress reports were made by several of the standardization committees, as noted below.

A joint session with the machine-shop practice division of the American Society of Mechanical Engineers was a departure. The success of this arrangement was indicated by expressions favoring the same arrangement for future meetings in large cities.

Visits were made to the plants of the Farrel-

Birmingham Co. and the Lumen Bearing Co., Buffalo. Members of the association were guests at a luncheon Oct. 12, given by A. A. Gloetzner, president of the Covert Gear & Mfg. Co., Lockport, N. Y.

E. J. Frost, past-president of the association, who recently disposed of his interest in the Frost Gear & Forge Co., Jackson, Mich., which required him to resign as a member of the executive committee of the A. G. M. A., was elected to honorary membership in the association. A. A. Henninger and D. A. Searle were admitted as executive representative and associate representative, respectively, of the New Process Gear Co., Syracuse, N. Y.

A. F. Cooke, vice-president Gears & Forgings, Inc., Pittsburgh, presided at the regular sessions and E. W. Miller, chief engineer, Fellows Gear Shaper Co., was chairman of the A. G. M. A.-A. S. M. E. joint session.

The next meeting of the association will be held in Cleveland during May, 1929.

Gives Comprehensive Data On High-Speed Turbine Gearing

INTERESTING data relating to reduction gearing of helical-tooth type were given in a paper on "High-Speed Turbine Gearing" by Ira Short, marine engineer, South Philadelphia Works, Westinghouse Electric & Mfg. Co., at the session held jointly with the shop practice division of the American Society of Mechanical Engineers. The paper dealt with the reduction gears furnished by the Westinghouse company, which since 1909 has built more than 3000 geared units ranging from 5 to 32,500 hp. and totaling well above 2,500,000 hp.

Action of the teeth of the gears was discussed and data relating to wear presented. Two distinct types of wear were said to occur at the meshing faces of the gear teeth, one being a regular change in the shape of the tooth profile, and the other the formation of a number of cavities or pits on the tooth face. From a photographic study of the first type it was to be seen that the wear varies considerably over the profile and is greater below the pitch line than above. There is considerable wear at the tips of the gear teeth but very little at the pitch line. In several installations it has been found that the metal flowed because of the combined rolling and sliding action until the thickness of the gear teeth at the pitch line, after being in operation for some time, was actually greater than when the gear was originally put into service. It is believed that the metal flowing from the tips of the gear teeth has maintained the pitch line very close to the original thickness.

The second type of wear, the formation of pits or cavities on the meshing faces, has been explained in a number of ways, but, according to Mr. Short, fatigue of the metal seems to be the best explanation. "The conditions are such at the point of contact between two meshing teeth that it is difficult to form an exact idea of the actual stresses set up. The stresses have been investigated by photoelastic methods, and it appears that a maximum shear stress occurs a short distance below the surface and travels along with the point of contact. Should there be any slight imperfection in its path or some irregularity on the meshing surfaces, the stress will be considerably increased and by repeated application will cause a crack and finally a pit.

"Pitting is considered to be in the nature of a corrective agency as metal is removed from the high spots, allowing the surrounding areas to carry their share of the load. It is found that pitting generally starts on a new machine shortly after it is put in service, and gradually decreases and finally stops completely after a few months."

A section of the paper was devoted to methods of lubricating the gear teeth and another to noise and its elimination. Noise from a gear is traceable to reproduction in the gear of errors in the hobbing machine, variable deflection of gear teeth with phases of tooth contact, and vibration transmitted from the connected machine. The arrangement of the hobbing machines used by the Westinghouse company for its high-speed gears was described and illustrated, special mention being made of the methods employed to assure accuracy of the master worm wheel. All parts of the hobber are checked periodically. The lead screw, also checked regularly, must not show an error exceeding 0.0005 in. per ft. in length.

The origin of noise emitted from a gear is traced by means of an instrument consisting of a portable cylinder and piston connected to ear pieces. The method of using this instrument was described by Mr. Short as follows: "The piston is moved in the cylinder until the air column in the latter is in resonance with the sound from the machine, when the sound will be heard distinctly. In using this 'resonator' the length of the air column is first made very short and gradually increased in length until the maximum sound is heard, when the length of the air column is noted. The piston is then moved further until the same note is again heard, and the length of air column is noted. The distance between these two points is then exactly one-half wave length of the sound. Knowing the velocity of sound to be about 792,000 in. per min. under average conditions and by noting the speed of the machine at the time of checking the sound wave, the sound waves per revolution can be determined from the formula—

Waves per rev. = $\frac{\text{Velocity of sound, inches per minute}}{\text{R.p.m. of machine} \times \text{wave length in inches}}$

"Knowing the waves per revolution, the source of the sound can generally be traced. A hobbing-machine error

will generally show up as the same number of sound waves per revolution as there are teeth in the master wormwheel.

"On all gears a note will be heard corresponding to one sound wave per tooth on the wheel. This note can be reduced to a minimum by using the 'even contact' design, which insures a constant deflection of the teeth."

Several typical gears were illustrated by lantern slides and a model of a double-reduction marine gear for transmitting 3000 s.h.p. on two pinions with a reduction of 3340-585-90 r.p.m. was shown.

Gear Teeth Finished by Shaving Process

THE Pratt & Whitney gear-shaving process, invented by James H. Barnes, Dayton, Ohio, was described by H. D. Tanner, manager of the gear division of the Pratt & Whitney Co., Hartford, at the A.G.M.A.-A.S.M.E. joint session.

In this process the teeth of unhardened gears are finished in an automatic machine, designed for the purpose, to conform to the theoretically correct involute curve, a small amount of material being shaved from the tooth faces and flanks of the gears.

After explaining the underlying principles of the process, Mr. Tanner said: "It now becomes apparent that the process is one of zero-degree generation and that the active profiles of the gear teeth are generated by rolling the gear in mesh with a zero-degree rack. The active profiles of this rack are the top edges of its teeth, which coincide with the cutting edges of the tools. The remainder of the profile of the rack does not come in contact with the

gear. We are then required to make tools with straight cutting edges slightly longer than the face of the gear to be cut and to place the tools in the shaving machine with their edges lying in a plane tangent to the base cylinder of the gear. If the edges are parallel to the center line of the gear, a spur gear will be produced. If they are parallel to each other but at an angle to the center line of the gear, a helical gear will be produced."

A large cam, with two opposed involutes and two cam rolls are used in the machine and two cutting tools are employed. The component parts, including the master involute cam, which is the only precision form used in the machine, were described in detail. The milling and grinding of the involute profiles of the master cams was also outlined. Operation of the machine was shown by means of moving pictures.

Discusses Methods of Checking Gear Quality

INSTRUMENTS of both "elemental" and "integrating" type, for maintaining the quality of gearing, were reviewed by Russell M. Coldwell, Fellows Gear Shaper Co., in a paper on "Predetermining Gear Quality."

As the term implies, instruments of the first class are for checking the elemental characteristics of gears. The integrating measuring instruments "combine the elemental errors so that the effect of the combination of errors may be predetermined." Of the latter class a machine designated as the Red Liner, which records errors in gears by means of a pen on a constantly moving chart, was described in detail.

Gear Lapping Facilitated by Manufactured Abrasives

CARE in selecting lapping media, whether the lapping is done for smoothing or fault correcting, was emphasized by H. J. Willis, research engineer, Carborundum Co., Niagara Falls, N. Y., in a paper on "The Manufactured Abrasive In Gear Lapping."

No one abrasive is suitable for more than a few types of gears, said Mr. Willis. Hardened gears having a sliding action require a hard sharp grain, which if used on soft gears having a rolling action would prove disastrous. Gears having both rolling and sliding action require a still different abrasive.

Natural abrasives were said to vary widely in purity, which seriously affects the quality of work they do. Generally speaking, nearly all of them are suitable for polishing only. Ground glass, it was stated, is not suitable for hard gears and is too splintery for soft. It is generally of poor grading and varies in quality. Because of its resistance to crushing, it is harmful to bearings.

Manufactured abrasives discussed were made of crystalline alumina and carbide of silicon. Some grades of the former are suitable for soft gears having sliding action, but are too soft for hard gears, especially of the rolling type. It is uniform in quality and grading. Carbide of silicon is suitable for hard gears of any class; but is too sharp for soft gears. It is made both green and black, the latter being best for gear work.

Abrasive Selected for Softest Gears In Train

In all cases the abrasives must be selected for the softest gears in a pair or train. "It is not sufficient, either, merely to select the kind of grain of the common gradings that are available," said Mr. Willis. "Research in gear lapping, particularly of spiral bevels, has demonstrated that a closely graded grain that will cut fast enough for commercial lapping is too harsh and will leave deep grain marks. Consequently, packing with a well selected grit is required to combine good finish with speed." To meet this situation, the Carborundum company has developed a carbide of silicon grain, designated as the RAA, for use on spiral bevel and hypoid gears. It is particularly adapted for lapping where considerable metal is to be removed.

The usual practice in lapping these gears is to make up a batch of grain and oil and use it until it is exhausted or the grain is broken down. To offset the constant change

in lapping action as the grain breaks down, fresh grains and oil are added daily. This perpetual mix idea was advocated strongly.

It was stated that too little attention is given to the selection of the vehicle for carrying the grain. Some of the defects of oils, soaps and greases, when used with abrasives as lapping media, were discussed, and specifications of the ideal vehicle given.

"Heavy oils and greases will suspend the grain fairly well," said Mr. Willis, "but are messy, hard to clean and generally retard the cutting. Thin oils work faster but will not suspend the abrasive unless the proportion of grain to oil is excessive. Grain must not be present in the vehicle much in excess of 25 per cent, in order to allow spaces for the removal of metal and to permit the free and individual abrasive action of each grit. But grain in this proportion in any kind of oil will not be stabilized, because it will generally form in pockets. Many complaints on quality of grain can be traced directly to these pockets and to the variables in oils and grain proportions."

A "finishing compound" that is said to be free from the variables mentioned has been developed by the Carborundum company and is available for each of 10 major lapping operations, with several grades of fineness for each. Particularly pleasing progress was said to have been made in gear lapping, the time for finishing straight worms having been cut 62 per cent in lapping, and soft spur gears and helicals, 68 per cent. For spiral bevels the development is too recent to make definite statements.

Lapped gears should be cleaned off thoroughly regardless of what abrasive is used, said Mr. Willis. He maintains that there are neither natural nor manufactured abrasives that will crush down to a degree of fineness that it will be harmless to gears and bearings. Researches by the company were said to have produced a grain in a compound that is suitable for the running in of plain bronze or babbitt bearings without impregnating the bearings.

Advocates Arc Welded Steel Construction

THE importance of arc welding in making possible the application of steel, with substantial economies, where cast iron has usually been employed, was emphasized by J. F. Lincoln, vice-president and general manager of the

Lincoln Electric Co., Cleveland, in an address on "The Effect of Arc Welding on Manufacturing."

Motors, arc welding machinery and other products of the company in which welded steel parts are used in place of castings were shown by lantern slides. Redesign of

many of these parts to permit the use of welded steel was begun several years ago, and it was stated that, in general, there has been a reduction of at least 50 per cent in the cost of these parts. An abstract of Mr. Lincoln's address will be given in a forthcoming issue of THE IRON AGE.

Gear Standardization Work Going Forward

REPORTS submitted by the several subcommittees of the general standardization committee, which is headed by B. F. Waterman, engineer, Brown & Sharpe Mfg. Co., Providence, and vice-president of the association, indicate definite progress. No recommended practices were offered for adoption, but it is expected that several of the projects will be ready for presentation at the next meeting. Round table gatherings of the subcommittees were held, as heretofore, for the purpose of formulating plans for work over the next six months. The status of some of the standards work is given in part below.

Working on Alloy Steel Specifications for Gears

AN analysis of 54 replies to a questionnaire relating to alloy steel specifications for gears, sent to the association's membership, was presented by Chester B. Hamilton, Jr., Hamilton Gear & Machine Co., Toronto, Canada, chairman of the metallurgical committee.

Alloy steels which, according to the replies to the questionnaire, should be retained, include S. A. E. No. 2315, 3½ per cent nickel, case hardening; No. 3115, low-chrome nickel, case hardening; No. 3215, medium-chrome, medium-nickel, case hardening; No. 3312, high-chrome, high-nickel, case hardening; No. 3340, high-chrome, high-nickel, in the hardening and tempering grade; and No. 6120, chrome-vanadium case hardening steel. S. A. E. No. 2350, 3½ per cent nickel, hardening and tempering steel is also retained but No. 2345 is dropped, because the No. 2350, with suitable draw back, will meet the requirements.

No. 3145, low-chrome, low-nickel, in the hardening and tempering grade, was the subject of a special question and is still before the committee. This is not an S. A. E. steel. S. A. E. 3245, medium-chrome, medium-nickel steel in hardening and tempering grade, is indorsed by a large majority. However, a number of replies advocated a change to No. 3250, and it was pointed out by Mr. Hamilton that there is evidently a strong feeling in this direction among S. A. E. users of this steel. S. A. E. 6150 chrome-vanadium steel, hardening and tempering grade, will be retained and 6145 dropped, because the former, with suitable draw back will meet all requirements. S. A. E. 2512, a 5 per cent nickel case hardening steel, will be added, 98 per cent of those replying to the questionnaire being in favor of it.

It is expected that the committee will not include the new high-manganese case hardening steels in the A. G. M. A. list of standard specifications.

Spur Gear Tables Compiled

TABLES for quickly finding the diameters and necessary dimensions of metallic pinions for various horsepower to be transmitted at various speeds were presented by the spur gear committee, the chairman of which is J. L. Williamson, Fellows Gear Shaper Co., Springfield, Vt. The tables, prepared by L. F. Burnham, Westinghouse Electric & Mfg. Co., East Pittsburgh, are prefaced by a statement of maximum tooth stress and other specific values adopted, the formulas upon which the tables were computed being also given.

The large amount of work done in preparing these tables received favorable comment. B. F. Waterman, engineer, Brown & Sharpe Mfg. Co., Providence, said that the method used was of high value. The possible effect of wear data

being obtained on the Lewis machine at the Massachusetts Institute of Technology was brought up and in this connection Mr. Waterman pointed out that the Lewis formula usually provides satisfactory resistance to wear and that, at any rate, the tables could be supplemented by others based on wear factors established by the data from the tests on the Lewis machine. So far as strength is concerned, it seemed generally conceded that the tables are a good guide.

The tooth form committee, which is headed by H. J. Eberhardt, secretary, Newark Gear Cutting Machine Co., Newark, N. J., reported progress on several items of its program. A table of chordal dimensions for all types of gears is being prepared. Relating to modification of hobs for tip relief purposes, it was stated that the committee cannot at present recommend a fixed amount. "The main difficulty," it was stated, "lies in the geometrical fact that the amount of relief generated varies for each diameter, and therefore gears may have too much of the tooth involute removed and the meshing pinions very little." It was indicated that the present trend was toward less tip relief than formerly, which is in line with improvements in the art of gear cutting and mounting.

Helical and Worm Gear Nomenclature Being Prepared

DEFINITION of backlash as "the shortest distance between non-driving surfaces of adjacent teeth in mating gears" was accepted by the association, at the suggestion of the nomenclature committee, the chairman of which is D. T. Hamilton, Fellows Gear Shaper Co.

Standard nomenclature for helical gears is being prepared and the committee expects to have material ready for the next meeting. Preparation of a standard worm gear nomenclature is also in progress, this work being in conjunction with the worm gear committee, the new chairman of which is W. H. Himes, Westinghouse Electric & Mfg. Co.

Keystock sizes and materials are on the program of the keyway committee, of which R. B. Zerfey, engineer, Tool Steel Gear & Pinion Co., Cincinnati, is chairman. It is planned to formally recommend the use of the low carbon keystock now available for industrial gears. For heavy duty work it was suggested that 40-50-point carbon steel might be recommended, but the consensus of opinion was that only one key material should be standardized; for special cases keystock of special material could be selected.

Tables of dimensions of special keys, such as Barth, Kennedy and Woodruff, will be printed in A. G. M. A. data sheet form by the association's library committee.

The sprocket committee is working along the same lines as the sectional committee on chains and sprockets, of which the A. G. M. A. is one of the sponsors, said G. M. Bartlett, professor of machine design, Purdue University, Lafayette, Ind., chairman of the committee.

Three meetings have been held during the past year by the subcommittee on roller chains and one meeting by the A. G. M. A. sprocket committee. Discontinuance of the present "narrow," "medium" and "light" series of roller chains, and designation of the present "heavy" series as standard has been under consideration. A new series, to be known as the extra heavy, with pitches from ¾ to 2½ in., and inside plate thickness 1/32 in. greater, up to and including the 2-in. pitch, and 1/16 in. greater for the 2½-in. pitch, has been added. A standard light weight machinery chain of ½-in. pitch, ¼ in. wide and with 0.306-in. diameter rollers has also been added. The ¾-in. pitch stan-

dard roller chain has been changed to a rollerless chain with 0.200-in. diameter bushings, 0.141-in. pins and 3/16-in. width.

Specification of standard tolerances for side plates, pins and bushings, to permit interchangeability of the links of various makes of chain, is an important item of the committee's work. Certain dimensions of offset links have also been standardized, permitting interchangeability. Other work of the subcommittee includes modification of the chamfering curve on the sides of the sprocket teeth to improve the action of the chain link in passing over the teeth, especially under conditions of misalignment.

Formulas for the average working loads and horsepower have been worked out to aid in the selection of chain and also formulas for the maximum r.p.m. of sprockets, to aid in the design of chain drives. The discontinuance of the formula for breaking strength is being recommended by the sectional committee.

No definite steps have been taken by the non-metallic gearing committee. T. C. Roantree, Westinghouse Electric

& Mfg. Co., East Pittsburgh, chairman, in presenting a progress report, indicated that the committee intended to introduce a contact duration factor "C" in the horsepower formula for non-metallic gears. The need for such a factor is indicated by the gear tests on the Lewis machine at the Massachusetts Institute of Technology, but changes will not be made until the tests are completed.

A blueprint showing the variation of the working stress with the pitch line velocity of gears of steel, cast iron and phenolic material, making use of the new formula for

150
velocity increment loads, $(\frac{\quad}{200V} + 0.25)$, has been prepared.

This blueprint, which will be issued in A. G. M. A. data sheet form, as supplementary data, shows that gears of phenolic materials are equal in strength to cast iron gears at 1800 ft. per min. and to forged steel gears at 4800 ft. per min.

Institute Visits Spain's Iron Mines

British Organization Meets at Bilbao—Technical Papers Featured by Description of Mining in Vizcaya—Corrosion Also Important Topic

THE autumn meeting of the Iron and Steel Institute (British) in Bilbao, Spain, was more notable because of the opportunities it gave for an inspection of iron mines and steel plants of that country than for technical papers and discussions. Little time was left for the latter, but several papers were presented. Summaries of them are given below. On another page of this issue is an account of the other features of the excursion made by the institute members to Bilbao, repeating a visit to that city made 32 years ago.

Iron Mining in Vizcaya

Main interest centered on the paper of José Balzola of Bilbao, who described iron ore mining in Vizcaya. This paper went over a good deal of the ground covered by the late William Gill, then resident manager of the Orconera Iron Ore Co., on the occasion of the institute's previous visit to Bilbao in 1896, and brought up to date the information then given.

The author estimated that the present workings of the district show a content of some 65 million tons of ore, 40 per cent of which is probably spathic, with a reserve of some 40 million tons, and a further 60 million tons in un-bored parts of the district. The future is dependent on the spathic ore (having a density of 2.8 to 3). The conditions under which the ore has to be extracted, compared with rubio, necessitate a larger consumption of explosives, but this is compensated for by the fact that the faces are much cleaner and the general conditions favor systematic mechanization. On the other hand, 40 per cent more crude spathic ore has to be extracted than the amount of calcined ore obtained, but this also has its compensation in the higher iron content.

Comparing the behavior of first class rubio (having a density of from 2 to 2.5) and first class spathic in the furnace, the author noted that the latter shows higher loss in the flue and its higher sulphur content calls for a more basic slag. Even taking into consideration these disadvantages, a calculation of the comparative furnace changes seems to indicate that the calcined spathic could be 20 per cent higher than that of rubio. That is not the case today, but it is expected that as time goes on prices will be stabilized and that the relation of the price of calcined to the rubio price may reach this percentage. In this compari-

son the calcined spathic has been assumed to have no further treatment and to be used alone. In practice this is not feasible, but the ore sinters very well, and if submitted to this treatment it could be used as the principal ore. If, for instance, 40 per cent of it were submitted to sintering, the sulphur content could be reduced to, say, 0.28 per cent. The surcharge of 2 pesetas per ton incurred by this treatment is balanced by the reduction in sulphur content and of flue losses.

The production of rubio has been steadily decreasing since 1899; the mines are becoming steadily poorer in this class of ore, and very few have maintained their reserves intact. In the production of rubio, labor costs amount to 40 per cent of the total, but this item could be reduced by mechanical methods of loading and improving transport in big mines. Spathic mines can be mechanized under better conditions than rubio, as the ore is clean, almost free from waste, and the majority of mines have considerable quantities of this ore.

Some interesting facts were given by the author regarding the conditions of iron ore mining in Spain. Under the law of the country, the state grants a concession of mining rights to any person who applies for it, without the necessity of consulting the owner of the surface or proving the existence of the mineral. The minimum unit of surface area for which mining rights can be granted is 4 pertenencias (a pertenencia is a rectangle of 100 m. square, i.e., 1 hectare), and the royalty to be paid, which varies according to the class of minerals to be mined, is 6 pesetas per pertenencia for iron ore.

The concession of a mine only becomes void through non-payment of the surface royalty, and the mine itself may be left unexploited as long as the concessionaire desires. Due to the insignificance of the royalty paid and to the exploitation of the mine not being enforced within a fixed number of years, many mines containing large quantities of minerals are left unworked. As a general rule the mines are not worked by the owners, but are leased at a certain royalty per ton on a minimum output per annum. The lessee on his part usually employs a contractor who extracts the mineral and puts it into storage.

The royalty paid by the lessee to the owner varies according to the class of mineral. It oscillates between 0.50 peseta

(in very old contracts) and 6 pesetas in some; the average is about 2 pesetas per ton.

Contracts are usually of two classes. In big companies like the Orconera, Franco-Belga, and Parcocha to a certain extent, the principal installations, lines, compressors, locomotives, inclines, etc., are the property of the company and are worked under their administration. The contractor has a contract for one year, placing the output near the main-line railroad and into stock, all charges in connection with raising the ore, loading, and unloading being on his account. In this type of contract a fixed sum is usually paid for each product extracted, be it mineral or overburden.

Usually contracts are given at a fixed price per ton of rubio, spathic, or washed ore placed in stock or loaded into railroad cars. In this case the contractor is liable for all risks. He buys the machinery, and erects inclines, tracks, etc. The price varies from 8 pesetas to 10 pesetas per ton for rubio and 10 pesetas to 12 pesetas for calcined spathic. The lessee pays all charges for transport and general administration, royalties to the owners, etc. For every workman employed in the mines the law enforces the payment of 12 centimos (about 1¼d.) per day toward the workmen's pension fund, and the payments for accidents are about 4 per cent of the daily wage.

Transverse Test for Cast Iron

J. G. Pearce, director British Cast Iron Research Association, suggested that the true criterion of transverse strength is the modulus of rupture determined for the actual bar section, measured at the point of fracture. By concentration on the new standard cylindrical transverse bar test, and by casting bars of varied sizes and compositions, it becomes possible to chart relations between size and strength and between composition and strength. The author showed that the transverse rupture modulus increases continuously as the test bar diameter diminishes until the point is reached at which the metal ceases to be gray. The size-strength curve is a useful index to the behavior of cast iron in thick sections, and the composition-strength curve deduced from a series of these promises to be of considerable assistance both to the designer of cast-iron structures and to the founder who has to realize the designer's ideas. The transverse strength is closely related to tensile and compressive strengths, but this relationship is only shown if the transverse strength is expressed as rupture modulus, based on the area at fracture.

Corrosion of Iron and Steel

In their paper on the phenomena of corrosion of iron and steel, A. Herrero and M. de Zubiria of Bilbao studied the problem of corrosion due to atmospheric agency alone. They referred to the serious depletion of our fuel reserves resulting from failure to attack this evil at its source. On this point the authors assumed a world's annual production of 100,000,000 tons and an average life of iron and steel products of 30 years. With a consumption of four to five tons of coal or its equivalent per ton of steel, from the getting of the ore to the finished product, the loss is obvious. The problem is acute in Spain, where atmospheric conditions appear singularly productive of corrosion, but emphasis was laid on the point that raising the price of ordinary commercial steels above that at which they must of necessity be sold would not provide an economic solution of the question. The causes producing corrosion were described as of two distinct types: (1) those which are independent of the object which suffers corrosion, and (2) those which are a function of the physical or chemical properties of the object. In the first category faulty design was mentioned as an important cause of corrosion. The miscalculation of certain principal parts of a steel structure has resulted in the material being stressed in parts beyond its

elastic limit. Under such conditions the parts so stressed are highly liable to corrode even though the remainder may remain normal, and thus the stability of the entire structure may be impaired.

It has also happened in the case of a structure perfectly designed from the point of view of resistance to the mechanical stresses that rain water may accumulate in hollow spots and remain a long time without draining off, and if such spots are not easily accessible it may not be easy to keep them properly painted or remove any coating of rust which may have formed on the steel structure. All such cases show the importance of the study of corrosion from the point of view of safety, and how the rusting of a small and insignificant part may lead to the destruction of the whole structure.

Concerning the general atmospheric conditions, it is evident that a moist air and persistent exposure to rain with strong aeration are agents which particularly favor corrosion, since both the electrolyte and influence of oxygen then come into action. If to these conditions be added that of proximity to the sea, bringing with it air laden with sodium chloride, which increases the conductivity of the electrolyte and consequently accelerates the corrosion, it will be readily understood that the metallurgical works of Vizcaya are unfortunately exposed to a combination of all the circumstances most apt to produce intensive corrosion due to external causes.

With regard to the internal causes which stimulate corrosion the authors advocated proper heat treatment and mechanical treatment, the elimination of impurities and avoidance of segregations, as the principal objects to aim at to obtain improvement.

Mechanical Properties of Carbon Steels

Joaquin Orlando of Madrid described experiments to determine the influence of pearlitization below the A_1 point on the mechanical properties of carbon steels. On tempering quenched steel a finely granular pearlite is obtained which gives to the steel both a tensile strength and an impact resistance greater than that given by laminar pearlite in annealed steel. For low carbon steels a temperature of 500 deg. C. appears to be the best. For higher percentages of carbon the temperature of 580 deg. C. has yielded good results.

Steel Bath Conditions

J. H. Whiteley of Consett discussed some of the observations by which a smelter is guided in judging the condition of a bath of steel, and described an investigation which he has carried out. Although much further work is needed, the results so far indicate that the examination of quenched pellets can yield additional information on bath conditions.

Cold-Drawn Heat-Treated Steel Wire

An examination of the properties of cold-drawn chromium-vanadium steel wire described by S. H. Rees of the research department at Woolwich shows that conclusions previously arrived at in connection with carbon steel wire are applicable when suitable modifications of the quantitative data have been made. Thus, complete restoration of elasticity at atmospheric temperature requires treatment at 300 deg. C. instead of 200 deg. C., and other changes which occur on low temperature heat treatment are comparable in extent when the chromium-vanadium wire has been heated at a temperature about 100 deg. C. higher than that applied to the carbon steel wire. In its behavior under stress at raised temperatures, the superiority of cold-drawn chromium-vanadium steel treated for 1 hr. at 400 deg. C. over the most suitably treated cold-drawn carbon steel wire (1 hr. at 300 deg. C.), and over the same steels hardened and tempered, is considerable.

Steel Treathers Meet in Philadelphia

Large Conclave of Metallurgists Discusses Progress in Stainless Iron, Tool and Alloy Steels, and Heat Treatment

—British Metallurgist's Lecture a Feature

MEETING in the city and hall where it held its second annual convention and exhibition in 1920, the American Society for Steel Treating last week, Oct. 8 to 12, celebrated its tenth annual gathering at Philadelphia. Those who were present at both conventions could not fail to be impressed with the remarkable strides which have been made in heat treatment both technically and in equipment as reflected in the exhibits.

Augmented by simultaneous conventions of the Institute of Metals and of the American Welding Society, National Metal Week again brought together groups of men whose interests interlace in varying degrees in the fields of pure science, practical metallurgy and work-a-day shop procedure.

A feature of the week was the Campbell memorial lecture by Dr. W. H. Hatfield, noted British metallurgist, which was listened to by about 550, a record for such gatherings.

The National Metal Exposition, while not so large as those of 1927 in Detroit and of 1926 in Chicago, was a marked success. Its compactness and attractiveness were commented upon, and exhibitors generally were optimistic as to the results and concede it one of the best in years.

Offering nearly 40 papers at 10 sessions the technical program was up to a high standard. Only a few of the important ones can be reviewed here. They all illustrated the progress being made in various fields of heat treatment.

Wide Interest in Stainless Irons

IT is evident that there is keen interest in the stainless irons and steels. One largely attended session was devoted entirely to these alloys. Four papers covered several developments, new steels and new applications were introduced to the assemblage and the meeting was one of the most instructive of the week.

The four papers were: "A New Development in Corrosion-Resisting Steel," by Frank R. Palmer, Carpenter Steel Co., Reading, Pa.; "Stainless Iron and Its Application to the Manufacture and Transportation of Nitric Acid," by Dr. Walter M. Mitchell, Central Alloy Steel Corporation, Massillon, Ohio; "Chromium-Copper Steels As Possible Corrosion-Resisting Ferrous Alloys," by Dr. B. D. Saklatwalla and A. W. Demmler, Vanadium Corporation of America, Bridgeville, Pa., and "An Investigation of the Physical Properties of Certain Chromium-Aluminum Steels," by Frank B. Lounsberry and Walter R. Breeler, Atlas Steel Corporation, Dunkirk, N. Y.

Zirconium Sulphide Solves a Machining Problem

A novel application of zirconium sulphide was announced as solving a difficult problem. In the machining and grinding of some of the high-chromium steels, trouble has been experienced, said Mr. Palmer, in his paper; the chips often adhere to the cutting tool, with similar difficulties in grinding. A solution of the problem is claimed to have been found.

Taking as a basis the known effect of fairly high percentages of sulphur and phosphorus on the machinability of certain steels, it was ascertained that the presence of 0.40 per cent of zirconium sulphide in the chromium alloys had the same effect on the machinability and the grinding properties as 0.30 per cent sulphur. The alloy steels, however, are easily worked with the presence of the zirconium sulphide, whereas they can not be with a high-sulphur content. Thus by introducing the sulphide of zirconium, the machining and grinding properties of rustless iron are greatly improved.

The author also announced that the presence of this

sulphide does not impair the resistance to corrosion nor to scaling at high temperatures and that the alloys can be forged or rolled under 2100 deg. Fahr. The sulphide does, however, decrease ductility and lowers the Izod value. Microscopically it does not dissolve in the ferrite, but is distributed as nuclei.

In the discussion it was brought out that stainless irons containing the zirconium sulphide can easily be cold drawn, but that its application to stainless steels had not yet been fully worked out, though it seems to have the same effect. An answer to questions as to how this sulphide is introduced was not forthcoming.

Dr. W. H. Hatfield of Sheffield, England, the Howe memorial lecturer this year, testified that some workers in England experienced the difficulties in machining and grinding referred to by Mr. Palmer, while others did not; that the alloys were not difficult to handle in their properly heat-treated condition. He made a plea for standardized corrosion tests as between British and American workers in this field so that there could be a common basis for judging results.

Rustless Iron in Nitric Acid Plants

One company is using, or has under contract, 1200 tons of stainless iron involving an investment of \$1,500,000 for equipment to make nitric acid by the fixation of nitrogen process, said Dr. Mitchell, in introducing his paper. Stainless irons have been found particularly resistant to nitric acid and the author discussed the requirement for the construction of equipment for the manufacture and transportation of the acid. He also critically examined the existing specifications for stainless iron for this purpose, dealing especially with plates, rivets, tubing, castings, tank cars, shipping drums, etc.

Making Cheaper Rustless Steels

In an attempt to develop a cheaper alloy than the regular stainless iron, Dr. Saklatwalla and Mr. Demmler, in their paper, offer a chromium-copper steel. They say a

low chromium (0.50 to 3.00 per cent) steel containing about 0.50 per cent copper is capable of being produced in open-hearth furnaces at a low cost. They point to it as occupying a position between the stainless irons and the plain

copper-bearing steels or ingot irons and as having superior rust-resisting properties, capable of being made at the cost of ordinary open-hearth steel plus the expense of the chromium and copper.

A Session Devoted to Steel Making

WHEN the session on steel melting was made a regular part of the program three years ago, it was the general impression that it was to be of a practical educational nature for the immediate benefit of steel treaters. This policy has been consistently carried out until this year. It is doubtful that anything is to be gained under the conditions suggested by the presentation of papers of the character of some of those last week. Two of the four papers at the session were of such a highly technical and mathematical nature as to be beyond the comprehension of all but a few specialists present. Commendable and excellent as these were, they belonged to an entirely different group or society meeting.

Steel Best Suited to Large Ingots

That acid open-hearth heats are best suited to the manufacture of larger ingots for heavy forgings was advanced by H. P. Rassbach, Midvale Steel Co., Philadelphia, in a paper, "Manufacture of Open-Hearth Steel for Forging Ingots." When ingots up to 400,000 and 500,000 lb. are to be made, there is less uncertainty regarding the success of transverse tension tests if acid steel is used. This grade is less complicated, said the author, than basic open-hearth and better results are obtained.

Mr. Rassbach described in some detail the practice of the Midvale company in making and pouring these large ingots of various sizes and shapes from 50 to 70-ton oil-fired furnaces.

How Silicon Deoxidizes Steel

Another chapter in the excellent work which Dr. C. H. Herty, Jr., and his associates at the Bureau of Mines Station at Pittsburgh are doing was embodied in a paper, "Deoxidation of Steel with Silicon," which he, with his coauthor, G. R. Fitterer, presented last week. Much of the paper had a theoretical basis and so had its discussion. The writing of the paper resulted from an investigation as to how silicon

deoxidizes steel and how far it goes under certain conditions.

The mechanism of the deoxidation with silicon is, first, the formation of silica by the reversible equation: $\text{Si} + 2 \text{FeO} = \text{SiO}_2 + 2 \text{Fe}$, and, second, a fluxing of more oxide of iron by the silica, forming a ferrous silicate inclusion. Complete deoxidation of steel is impossible unless the oxide formed is absolutely infusible and insoluble at steel-making temperatures. It may also be concluded, say the authors, that silicates high in iron or manganese will be more readily eliminated from the bath than high-silica particles, due to their lower melting point, with consequent increased rate of coalescence.

Commenting on this and other papers, Dr. W. H. Hatfield, Sheffield, England, paid a tribute to Dr. Herty by declaring that his investigations are being eagerly watched in England, particularly by the steel ingot committee of the Iron and Steel Institute, of which committee Dr. Hatfield is chairman. He offered the opinion that if steel is properly refined, its oxygen content will be very low and it will be free from inclusions; and to achieve that the electric furnace is best adapted.

Two other papers presented at this session were "The Equation of the Carbon-Time Curve in Open-Hearth Refining and Prediction of Carbon Drop," by Alexander L. Feild, Union Carbide & Carbon Corporation, New York, and "A Melting Record of Three Acid Open-Hearth Heats," by W. E. Griffiths, research metallurgist Union Carbide & Carbon Research Laboratories, Long Island City, N. Y., and C. E. Meissner, development engineer Chrome Steel Works, Carteret, N. J. Mr. Feild's paper contains a general survey of the physico-chemical relations obtaining during basic open-hearth refining and discusses the significance of the general differential equation involving the various factors. The other paper presents a complete log of three acid-open hearth heats so as to show the effect of adding silicon in the ladle rather than in the furnace.

Hardening Steel With Nitrogen

A SERIES of papers on aluminum steels and the nitride case-hardening process caused much discussion at one session. It is plain to see that the characteristics of the hardened surface and the economics of the process are being given much consideration by metallurgists and production men.

Raymond H. Hobrock of the Engineering Experiment Station, Purdue University, Lafayette, Ind., in a paper, "Surface Hardening of Special Steels with Ammonia Gas Under Pressure," finds that it is possible to reduce the nitriding time by one-half by conducting the operation at a pressure of 600 mm. of mercury above the atmosphere. In order to get a scleroscope hardness of 90 on the very surface, 30 hr. is required, regardless of the pressure. But increasing the pressure drives the case deeper (as shown in Fig. 8) and also produces uniform hardness of about 75 scleroscope for a considerable depth just under the skin. Theoretical considerations indicate that the latter represents the optimum hardness attainable by aluminum nitride; the extra skin hardness is thought to be due to some iron nitride existing there. It is also concluded that hardest surfaces of shallow depth may be made in high-aluminum

steel, but that if penetration is also desired, the amount of aluminum in solid solution must be closely controlled.

Many persons in the audience criticized Mr. Hobrock's use of the scleroscope for hardness measurements. G. M.

S. L. HOYT

Eaton, Molybdenum Corporation of America, believes that the Vickers diamond indenter (*THE IRON AGE*, March 1, 1928) is the best instrument for this purpose. It also can separate tough surfaces, which in practice withstand wear excellently, from unsatisfactory brittle cases. The impressions in steels of the former class are surrounded by ridges of plastically deformed metal, appearing much like the depressions made when testing mild steel, whereas brittle surfaces of no greater hardness will flake badly at the edge of the indentation.

Methods of test for nitrided surfaces, in the opinion of several speakers, should be correlated with wear resisting ability, since the parts so treated are ordinarily used in such service. Consequently a wear testing machine is badly needed. It was suggested that this might use the principle of drawing a soft iron wire across the hardened surface, it being well known that this is one of the most severe cutting actions occurring in manufacturing operations. That nitrided cases actually do resist wear is vividly shown by Guillet's experiment of running two aircraft engines for 100 hr. on a test block. One had nitrided piston rings and

cylinder bores. The other was of regular construction. The former was consuming oil at the same rate at the end as at the beginning, while the latter's oil consumption rate tripled.

Crystalline structure of the untreated steel is also an important factor in the success of nitriding. V. T. Malcolm, Chapman Valve Mfg. Co., Indian Orchard, Mass., said that the nitrided cases now being used by them on gear teeth are giving much superior service. The improvement is understood to come from better control and understanding of the process. This led to the inquiry as to whether aluminum oxide in the steel is not a controlling factor, but Prof. V. O. Homerberg, Massachusetts Institute of Technology, Cambridge, Mass., said that very few inclusions are visible under the microscope, and that impact strengths are satisfactory; consequently he concludes that the aluminum exists as metal. He emphasized that at least 30 per cent of the ammonia in the reaction chamber must be disassociated in order to prevent decarburization of the surface by the free hydrogen; in his opinion, lower carbon surfaces usually are brittle and unsatisfactory in service.

Two Methods of Heat Treating High-Speed Steel

HHEATING high-speed steel in a molten salt, or in molten lead, to a temperature of 2400 deg. Fahr. was shown to be feasible, in two papers read at one session. One of these, "A New Method for Heat Treating High-Speed Steel," was by Horace C. Knerr, 538 Washington Lane, Germantown, Philadelphia, who is consulting metallurgical engineer to Ajax Electrothermic Corporation, Summerill Tubing Co., and others. The other was read by Wilbur C. Searle, who is associated with the Leland-Gifford Co., Worcester, Mass. It was entitled "Heating High-Speed Steel to 2400 Deg. Fahr. in Molten Lead."

Heat Treating High-Speed Steel

FEATURES of the method described include electrical heating, close temperature control, which may be made automatic, the use of a salt bath which does not give off fumes or attack the tools, prolonged container life, absence of furnace deterioration, comfortable working conditions, low heating cost per pound of steel, and the ability to employ full hardening temperatures (in the neighborhood of 2400 deg. Fahr.) without injury to finished surfaces or cutting edges of high-speed steel tools.

Heating the container for a salt bath required to operate at temperatures of about 2400 deg. Fahr. for continuous periods has heretofore involved serious difficulties, including:

- (a) Attack of the container by the salt bath, or by decomposition products of the bath.
- (b) Attack of the container by products of combustion, or by the furnace atmosphere, when electric heat was used.
- (c) Rapid deterioration of furnace parts and lining, including the resistors when electrically heated.
- (d) Low fuel efficiency, owing to high sensible heat in the escaping products of combustion when burning gas or oil.
- (e) Difficulty of securing accurate temperature control.
- (f) Unpleasant working conditions, due to fumes, gases and heat, etc.

A new liquid bath has been developed which shows excellent characteristics at temperatures as high as 2450 deg. Fahr. The mixture is rather viscous just above its melting point, but at temperatures above 2250 deg. Fahr. it is sufficiently fluid to permit strong convection currents to be set up, which assure temperature uniformity within the container. Even at the highest temperatures (2450

deg.), a film of molten salt adheres to the piece of steel when removed, protecting its surface from the atmosphere during transfer to the quenching medium.

When uncontaminated from outside sources, the molten salt is neutral to steel, neither visibly attacking its surface nor causing serious carburization or decarburization. There are no fumes and its cost is moderate. Patent considerations prevent disclosing the composition at this time.

What Has Been Done in Service

Finished tools of various types have been heat treated at 2350 to 2400 deg. Fahr. without any mark upon the surface other than a slight discoloration. Sharp cutting edges were practically unaffected and retained file hardness. No pitting, scale or other surface defects occurred when the treatment was properly carried out. There was no warping, provided, of course, internal strains had been removed from the tools before treatment. These tools were quenched in oil and tempered either in a salt bath or an electric muffle furnace at 1100 deg. Fahr. for from 1 to 4 hr. Rockwell hardness of 62 to 65 C was obtained on the surface after tempering.

Drills, thread cutters, files, file cutting chisels and lathe tools treated by this method have been tested in service. Results compared favorably with tools treated in the open furnace and ground, and were superior to tools treated in salt baths at the customary lower temperatures.

Heating High-Speed Steel in Molten Lead

THIS paper describes the apparatus and method of heating high-speed steel to 2300 to 2400 deg. Fahr. in molten lead. Photomicrographs show the structure obtained in specimens at 2200, 2300 and 2400 deg. The method has been used for a number of years by at least two concerns in Worcester.

Work being hardened includes small and large pieces; any pieces that will go into the crucible can be hardened. Flat cutters, circular formed cutters, reamers, etc., are all hardened successfully by this method. It is possible to harden part of a flat cutter and have part not hard; also the cutting portion of a reamer can be hardened and the shank left soft.

How This Method Is Applied

Preheating is done usually in an electric oven furnace equipped with an automatic control. The control is set for 1600 deg. Fahr. A gas furnace is used for heating the lead, which is contained in a graphite crucible. Ordinary city gas, 530 B.t.u., is used. The time to bring the bath up to 2300 to 2350 deg. is 2½ to 3 hr. About 900 cu. ft. of gas is used, and about 200 cu. ft. an hour thereafter.

Pieces taken from the preheating furnace one at a time in a pair of tongs are held in the molten lead for a definite number of seconds, depending on the size of the piece. The ends of the tongs are just above the lead surface. The piece is removed at the end of the immersion period and dropped into a basket in the quenching oil. At the end of the heat the pieces are removed from the quench, washed in hot washing compound and placed in the electric furnace for tempering at 1050 to 1100 deg. Fahr.

Other Methods of Attaining High Temperature

In presenting his paper, Mr. Knerr prefaced his remarks with the statement that, through THE IRON AGE, he had learned that about 15,000 tons of high-speed steel is produced, sold and used annually in the United States.

Prof. W. Trinks, who presided at this meeting, read a communication stating that a method somewhat similar to that proposed by Mr. Knerr had been used elsewhere, in which two special salts were utilized, the second one being solvent in the first and used in quenching and drawing the material at 1100 deg. Fahr. The writer stated that he had been able to heat the first salt to 2250 deg. in 18 min. while using 19 kw. of electric power.

Another speaker told of another method for achieving the same result. He uses electric heat with close temperature control, the salt bath, and gets away from fumes and other troubles experienced from the use of combustible fuels. This method was developed in 1920 by A. E. Bellis, his salt being used in oil and gas furnaces. The electric furnace has now superseded the others, but for certain reasons the composition of the bath could not be given.

This salt is fluid enough above 1800 deg. Fahr. to assure a setting up of convection currents and thus produce circulation. Even when the temperature is as high as 2500 deg., a certain protective coating of the salt adheres to the steel when removed, and keeps it from oxidizing while being transferred to the quenching medium.

This method makes use of a heavy electrode. As there is no direct heating of the pot itself, the pot has an almost indefinite life. The early electrodes used for this process wore away rapidly, but a new type has been developed which gives evidence of being able to last indefinitely. The pot used is 8 in. in diameter and in many cases the liquid depth is about 11 in. There is a very thick heat insulation surrounding the whole apparatus. This was shown in two lantern slides, one of which showed a single pot, while the other showed three pots, all in the same surrounding insulating medium. Over 90 per cent of the total electric input was developed as actual heat in the electrode.

High-Chromium Additions in Making Steels

ADDITIONS of considerable chromium to high-carbon steels for dies and kindred uses were described in one paper read at the meeting. The steels here discussed had from 1.38 to 2.38 per cent of carbon and from 12.01 to 16.95 per cent of chromium. Another paper took up the addition of chromium to silicon-manganese steels as an aid to obtaining high physical properties in oil-quenching, which, for various reasons, is preferred in manufacturing practice to quenching in water. Abstracts of these two papers, and of the discussion which they elicited, follow.

Silicon-Manganese Steels With Chromium Additions

EXPERIMENTS in developing a type of steel not now used, for automotive and other similar use, were described by A. B. Kinzel, Union Carbide & Carbon Research Laboratories, Long Island City, N. Y. His paper, "Silicon-

Manganese Steels with Chromium Additions, for Engineering Applications," is briefly abstracted below:

For silicon-carbon steels the practical working carbon limits have been found to be about 0.20 to 0.40 per cent. Manganese, however, may vary with the silicon. Two 1-in. round specimens of the same analysis, each with 1 per cent silicon, were quenched from the same temperature, the one in water, the other in oil. Their resultant physical properties were as follows:

	Quenched in Oil	Quenched in Water
Yield point (a)	89,000	122,000
Ultimate strength (a)	115,000	135,000
Elongation, per cent.....	20	20
Reduction of area, per cent.....	54	58

(a) Pounds to the square inch.

This superiority in the water-quenched material appears to be typical of this type of steel. An effort was made to

produce a steel which would, on oil quenching, provide qualities equivalent to those here shown for water quenching. Such a steel was made with 1 per cent chromium, 1 per cent manganese, 1 per cent silicon and 0.30 per cent carbon, which gave about the same results, whether quenched in oil or in water. Three samples of this steel, A, B and C, gave results as follows, compared with other steels:

	Yield Point (a)	Ultimate Strength (a)	Elongation, Per Cent	Reduction of Area, Per Cent
A	136,000	151,000	18	50
B	175,000	201,000	10	42
C	151,000	167,000	12	48
D	128,000	152,000	12	52
E	125,000	150,000	15	57
F	142,000	167,000	20	53

(a) Pounds to the square inch; D, S.A.E. No. 2330, 3½ per cent nickel; E, S.A.E. No. 3130, chrome-nickel; F, S.A.E. No. 6145.

From these comparative data it is seen that the steel now proposed for use in automotive and kindred parts is of the same order of excellent utility as those now in general use for such purposes, and is superior in some qualities, notably strength. Plain manganese steels, however, without the silicon addition, fall short of such properties. This work was carried out at first on 6-lb. ingots. Later the studies were made on heats from a 300-lb. electric furnace.

It follows that a medium carbon (around 0.35 per cent) silico-manganese steel is available whose physical properties make it suitable for use in engineering work and it is susceptible to easy heat treatment. Its properties are on the same order as those of the best alloy steels, heat treated.

Probably the best result from Mr. Kinzel's paper, in the opinion of Allen L. Davis, Scovill Mfg. Co., Bristol, Conn., lies in his introducing to users the product with which he has been experimenting. It is not a new steel, for such analyses were made 15 years ago. But it has not become known, and it may well be added to the list of steels at command of the engineer.

High-Carbon High-Chromium Steels

CERTAIN physical characteristics of high-carbon, high-chromium steels were discussed in a paper by James P. Gill, chief metallurgist Vanadium Alloys Steel Co., Latrobe,

Pa. The author compares the properties of six steels of the high-carbon, high-chromium class, which, during recent years, have become so popular as die steels. The comparison covers the critical points, hardening and tempering curves, microstructure and physical properties. A short discussion of the constitution of steels of this class is included; also a brief historical outline of the development of steels of this type.

Suitable for Many Tools

Such qualities as high resistance to wear, nondeformation on hardening and ability to harden in oil or air, adapt this steel to a wide variety of tools and dies. Possible applications are almost unlimited; a few of the uses for which it is especially suited are as follows: blanking dies, drawing dies, coining dies, forming dies, thread rolling dies, trimming dies, shear blades, punches, lathe centers, gages, bushings, certain types of cold-heading dies, rolls for cold forming, seaming rolls, wear plates, brick mold liners, cutting tools for brass and bronze, guides, mandrels, etc.

In the table is given the chemical composition of the six steels studied:

CHEMICAL COMPOSITION OF STEELS STUDIED
Per Cent

Steel	C	Si	Mn	S	P	Cr	V	Co	Ni	Mo
A	2.38	0.42	0.71	0.010	0.030	12.48	0.00	0.00	0.24	0.00
B	2.12	0.24	0.31	0.020	0.021	13.20	0.81	0.00	0.12	0.00
C	1.38	0.35	0.26	0.006	0.015	12.20	0.00	3.45	0.00	0.54
D	2.17	0.19	0.46	0.009	0.015	13.43	0.00	0.00	0.51	0.00
E	1.60	0.09	0.30	0.011	0.026	16.95	0.00	0.00	0.31	0.00
H	2.19	0.24	0.39	0.012	0.018	12.01	0.72	0.66	0.00	0.00

Difficulty in machining material of this character was stressed by H. J. Keshian, metallurgist Chase Companies, Waterbury, Conn., in discussing Mr. Gill's paper. The machining properties are even more difficult than with high-speed steel. The same difficulty is experienced when it is attempted to grind this material. As a result, special types of grinding wheels are necessary in handling it.

It was found experimentally that lowering of the carbon to 1 or 1½ per cent does not assist much in this problem of machining or grinding. Taking up this phase of the subject, Mr. Gill reported having found that, when such material is at a Brinell hardness of 196, it machines appreciably easier than at 250. All chromium steels have the property of machining in a "gummy" manner. That is, there is a piling up of material on the cutting edge of the tool, thus interfering with its free action.

Various Important Topics Covered by Single Papers

WHILE some of the sessions were so developed as to cover mainly some major topic, with a number of papers on different phases of that topic, there were other sessions at which the papers had little or no relation to each other. A group of such papers, read at several sessions, has been abstracted in the following pages.

On Oxygen Dissolved in Steel

ILLUSTRATING his paper with a number of lantern slides, Marcus A. Grossmann, metallurgical engineer Central Alloy Steel Corporation, Canton, Ohio, discussed the subject of "Oxygen Dissolved in Steel, and Its Influence on the Structure." An abstract of his paper follows:

It is shown that in regular pack carburizing (box carburizing), steel absorbs not only carbon but also oxygen, which diffuses into the steel. This was determined by analyzing strictly comparable samples for oxygen, one sample before carburizing and the comparative sample after carburizing. The oxygen determinations were made by the vacuum fusion method, in a graphite crucible.

The amount of soluble oxygen present in steel appears to affect the microstructure. (The soluble oxygen diffuses readily, and is considered here apart from precipitated oxides and nonmetallic inclusions.) A high oxygen content seemingly favors solubility of cementite in alpha iron, and as a result of this solubility it affords opportunity for cementite to diffuse. This theory, advanced by P. D. Merica in a consideration of these data, is supported by all evidence which is at present available.

In certain steels, cementite may occur not as pearlite but as massive cementite associated with grains of ferrite. The separation of pearlite into massive cementite and ferrite appears to be due to diffusion.

Cementite diffusion (and hence agglomeration) seemingly accounts for the phenomenon of "split cementite" in the structures observed in a McQuaid-Ehn test, and also for the structure of "boundary cementite" in low-carbon steels. These structures are characteristic of high-oxygen material. McQuaid-Ehn phenomena should be examined in

the light of original oxygen in the steel plus oxygen absorbed in carburizing.

Solubility of cementite in alpha iron can be indicated on the iron-carbon diagram. Since some steels exhibit

Fig. 11 (Left)—Iron-Carbon Diagram Indicating Some Solubility of Cementite in Alpha Iron

Fig. 12—"Ordinary" Iron-Carbon Diagram. Cementite Insoluble in Alpha Iron

cementite diffusion while others do not, it is suggested that different iron-carbon diagrams can be drawn for different steels, varying the diagram to accord with the cementite solubility and hence with the diffusion power. Oxygen contents must apparently be considered, and in carburized steels it is the oxygen content after carburizing that is significant.

If the solubility of cementite in alpha iron varies for different steels, these variations can be indicated by changes in the iron-carbon diagrams which represent those different steels.

In discussing this paper one speaker reported having tried to check the results obtained, without finding any definite effect from the treatment. In one case—that of ingot iron—he found an actual decrease, from 0.049 per cent to 0.037 per cent of oxygen, after carburizing the specimen for 36 hr.

Dr. H. W. Gillett, United States Bureau of Standards, made particular reference to the iron-carbon diagram as the "foundation stone of all our knowledge of heat treatment." In a study extended over 10 years or more the bureau has collected a mass of data. He pointed out that in deoxidized material, especially that of about $\frac{1}{4}$ per cent Mn, the P point comes nearer to the left of the diagram than when in the presence of dissolved iron oxide.

Electric Furnaces for Heat Treating

DEVELOPMENT of electric furnaces was briefly reviewed and their advantages for heat treating was pointed out in a paper, "Progress Made in the Use of Electric Furnaces for Heat Treating." The author, Albert N. Otis, is associated with the industrial heating and welding engineering department, General Electric Co., Schenectady, N. Y. The object of the paper was to show the present status of electric furnaces, the extent of their use for heat treating, and some new types which have been developed recently.

Rapid increase in the use of electric furnaces is shown by a list of the principal installations, describing briefly some of the individual furnaces and their operation. Photographs are shown to illustrate the various types. Reference is made to specific applications, including furnaces for annealing tool steel bars and rods, and elevator furnaces for annealing sheet steel for electrical machines, the latter without the use of boxes. Large savings are shown by this method.

Among new developments, electric furnaces for forging are referred to, also continuous furnaces for the new process of copper brazing, and for annealing in atmospheres of protecting gas.

Greater Production at Lower Cost

There is no doubt that the development of electric heating has been a valuable contribution to the manufac-

turing industries. They are an aid in improving quality, reducing cost, providing better working conditions and enabling output per man to be increased. This art is relatively new, and appears to have vast possibilities for the future.

In response to several questions from the floor, Mr. Otis stated that the annealing boxes ordinarily used in heat-treating in electric furnaces are made customarily of steel plates. The Ludlum Steel Co., however, has been using alloy steel boxes for the past three years without losing any boxes, and an examination of them shows that they probably have many more years of usefulness ahead.

In comparing costs of electric heat treating against heat-treating using oil as fuel, the unit prices were $1\frac{1}{4}$ c. for each kw-hr. in the electric furnace and $5\frac{1}{4}$ c. a gallon for oil.

Steel Failures in Aircraft

THIS paper discusses failures in steel aircraft parts which have been investigated by the metallurgical laboratory at Wright Field. The author, F. T. Sisco, is chief of the metallurgical laboratory, Air Corps, Wright Field, Dayton, Ohio. The methods used in the investigation of these failures are described briefly, followed by a classification of the various failures in respect to their origin.

Included in this classification is an account, illustrated by typical and representative cases, of: (1) failures due to faulty manufacturing methods and not caused by defective material; (2) failures due to internal defects, such as non-metallic inclusions; (3) failures due to seams and other surface defects; (4) miscellaneous failures due to defective steel, including large grain size, segregation and banding; (5) failures due to faulty or wrong heat treatment; and (6) failures due to welding.

Failures of material on aircraft in service are comparatively rare; probably 90 per cent of them occur during test. From the large number of failures investigated in the past five years, it has been possible to classify them, to form rather well defined opinions concerning their causes, and to make recommendations to reduce their number.

Some Causes of Metal Failure

It has been established without doubt that a concentration of stress occurs at sharp corners, keyways, screw threads, toolmarks, gear teeth and the like and leads to early fatigue failure. There has been some question as to whether non-metallic inclusions accelerate failure by fatigue. The results brought out by Lucas in his study of the path of fatigue failure, and by Styre in his discussion of Lucas' paper, show conclusively that fatigue cracks frequently have their origin in clusters of slag particles.

Several engine builders were troubled by an excessive number of valve spring failures. These springs were made out of a chromium-vanadium spring wire by experienced spring makers. The stresses on a valve spring can be estimated with a fair degree of accuracy. In one engine this stress varied from about 30,000 to 50,000 lb. to the sq. in. So far as is known the torsional endurance limit for spring tempered chromium-vanadium steel has not been determined, but past experience has set 30,000 to 50,000 lb. as a safe working stress for these springs.

When an excessive number of failures developed, the springs were increased in size so that the stress range was decreased to about 20,000 to 35,000 lb. to the sq. in. Even with this greater margin of safety the number of failures did not diminish noticeably.

Investigation disclosed that the steel in the springs was not of high quality. The detection of slag inclusions and other defects led to the conclusion that the failures were due to defective steel. After a search for a source of supply of high-grade steel, high-carbon piano wire was used for valve springs. With the introduction of these springs the stress range was increased to 35,000 to 50,000 lb. to the sq. in. and

the springs were placed in service. Failures of these springs are almost unknown.

Fatigue Failures Caused by Overloading

Practically all crankshaft failures are due to fatigue; most of them have their origin either in a fillet or in an oil hole. There is little doubt that the direct cause of failure is a highly concentrated stress at the point where failure starts. That this failure is due to overloading is probable. There is no direct evidence that hairline cracks, small seams or other defects cause the failure, but there is considerable basis for the assumption that they contribute materially.

The art of welding, especially of thin tubular products, has progressed to the point where it is practically 100 per cent perfect. The perfection attained is so high that at

now overcome these failures practically completely, by re-designing end fittings which attach the stream-line wire to the structure.

Tungsten Carbide—A New Tool Material

DEVELOPMENT of a material for use as the cutting edge of tools subjected to hard service and heavy duty was reported by Samuel L. Hoyt of the research laboratories of the General Electric Co., Schenectady, N. Y. Tools of this material, which has been much studied in Germany, were shown in operation at the Exposition. An abstract of Mr. Hoyt's paper follows:

Use of tungsten carbide as a tool material is described. In tool form it has a Brinell number of over 2000, with half the strength of high-speed steel, and it is capable of

present the welded fuselage is standard in airplane construction. Other applications of welding in airplane and engine construction are numerous and well known. Failures due to improper welding in the construction of the airplane are exceedingly rare. When they do occur they are almost always due to the welder, and seldom if ever have their origin in the materials or the process.

Improved Steels Have Benefited Others

There are already in existence sufficient types of steels to meet practically all needs which come up in engineering practice, according to Commander William Nelson, United States Navy, in his discussion of Mr. Sisco's paper. The effort should now be put forth to reduce the costs of manufacture of some of these steels and to increase their uniformity and reliability. Hazards in the use of aircraft are certainly high enough now, without introducing further hazards from the use of defective material. The aircraft industry, young and undeveloped as it is, has already caused improvements in materials which are becoming of increasing benefit to other industries.

Attention was called by T. W. Downs to the fallacy of introducing too great a hardness by heat treatment for the particular type of steel used. This has gone in many instances far beyond what the steel is made for, and has resulted in failures; for that reason.

In closing the discussion, Mr. Sisco referred particularly to the question of failures in stream-line wire, brought up in a question from the floor. He stated that these failures have come almost wholly in a series of epidemics, with a large number of failures at a time, followed by study of the causes and correction. The Army aircraft service has

scratching sapphire. Tests on machining quenched high-speed steel, glass, hard porcelain, Hadfield's manganese steel and abrasive compounds are described. On cast iron and steel the carbide tools are shown to be greatly superior to high-speed steel and capable of sustaining cutting at speeds which are several times that commonly used.

Experience gained in production by the General Electric Co. shows that these new tools rapidly attain great industrial importance and that they are indispensable in many lines of work. A number of these applications are described to show the type of performance which has been obtained. In general, the paper gives an account of what is claimed to be the first marked improvement in cutting tools since the introduction of high-speed steel by Taylor and White.

What the Material Will Do

A sample specimen ground to an edge of about 90 deg. is capable of cutting a rather deep, narrow groove in an alundum wheel without suffering much loss itself; whereas ordinary tool materials are worn away by the wheel. This behavior on the alundum wheel gives a good idea of the hardness of the material.

Quenched and tempered high-speed steel has a modulus of rupture in a transverse or cross-bending test of around 425,000 lb. to the sq. in. Similar tests have been run on tungsten carbide tool material at the laboratory, using a section ¼ in. square with supports 1½ in. apart. The German material is found to run around 225,000 lb., while our material runs around 250,000 to 275,000 lb. to the sq. in. We have not found it feasible to get a figure for the carbide without cobalt to compare with these figures. It is not likely that a good figure could be obtained, but we may

safely say that the pure carbide would come under 50,000 lb. Our experience indicates that such a material would be very weak.

These figures show that tungsten carbide has had its strength increased by the addition of cobalt to somewhat over half that of high-speed steel. Viewed in one light, this is to be considered as a substantial achievement, but this strength must also be regarded as a factor which places a definite limitation on the use of tungsten carbide in commercial practice.

Toughness an Important Quality

Another important property of a material of this type may be called "toughness"—the ability to stand up under stresses or impacts imposed on relatively small areas. A

Institute of Metals Lecturer

A SCHOLARLY review of the status of chromium and its alloys was delivered by Dr. F. M. Becket, at the dinner of the Institute of Metals. Dr. Becket has latterly devoted himself very largely to research in this field.

weak or fragile material would chip and flake off, but a tough one would stand stresses of this type without injury. This material possesses its share of toughness, since it withstands severe blows of a soft peen delivered on the edge of a bar. The blows are delivered in such a way that the edge would crumble if it were weak. A supporting block of copper shows marked indentations as a result of the blows on the material.

Inasmuch as the break comes abruptly when the bar does break, the material may be called brittle, in that sense. The fracture is of the curved type, while a weaker, or less "tough," material would break straight across.

Durability Between Tool Dressings

We compared tungsten carbide tools with a special alloy cutting tool which had given the best performance on this operation. Three tools were used on this job on two different heads, finishing three faces on the part. The tools of the special alloy required redressing after every 150 parts machined, on the average, when the tools became dull enough to require sharpening. Carbide tools were substituted under the same operating conditions, and finished 11,000 parts before they became dull enough to be redressed.

In the "low-tensile" field the durability of the tungsten carbide tools has been found to be of the order of 25 to 75 times that of high-speed tools. The difference is so great that the simplest kind of a test demonstrates the superiority of the carbide tool. Here the tool pressure is always light, the cuts are small, and the cutting speeds are high. Resistance to either wear or "burning" is the chief requirement of the tool.

One test log is a chromium-nickel steel with a Brinell hardness number of over 250. With a cut of $\frac{3}{8}$ in. and feed of $\frac{1}{8}$ in., good high-speed tools fail at 35 ft. a minute

in about 6 to 8 min. We run the carbide tools with the same cut and feed, but at 70 ft. a minute, and stop the test at 10 min. The tools show only slight wear at that point.

Discussing the paper on "carbology," a representative of the Vanadium Alloys Steel Co., Latrobe, Pa., pointed out that an important element in considering materials of this sort is their atomic concentration, or the specific gravity divided by the atomic weight. For the diamond this is about 0.293, and figures were read for several other materials. For a tungsten carbide it would be 0.160 for WC and 0.127 for W₂C, both of which are much lower than for the diamond.

Service Annealing of Sling and Crane Chains

METHODS of overcoming failures of chain in service were discussed by W. J. Merten, metallurgical engineer with the Westinghouse Electric & Mfg. Co., East Pittsburgh, in a paper, "Service Annealing of Sling and Crane Chains." This paper discusses the inconsistent results in ductility and strength ordinarily obtained when chains are annealed at temperatures unsuited for links that have been severely deformed and cold-worked in service. The author recommends a uniform recrystallization at temperatures considerably above the transformation range, to render the chain entirely safe for further service, without resorting to a reduction of the safety load and basing the calculation of permissible stresses on the average cross sectional dimensions only.

Analysis of the results of experimental and general evidence indicates that the factors involved in a complete reconditioning of a worn chain by reannealing are:

1. The degree of refinement of grain structure from the original heat treatment of forge welded chain.
2. The degree of plastic deformation or cold work during service.
3. The degree of temperature above the A_{c3} point and rapidity of cooling from this temperature.
4. The duration of the heating at and above critical temperatures.

Suggested heat treating practice for chains:

Heat treatment after forging—heat uniformly to above the finish forging temperature (1900 deg. Fahr.). Hold for 1 hr. for each inch of cross section of largest part of chain (ring or hook). Then cool in air to black heat (700 to 800 deg. Fahr.). Reheat uniformly to just above the A_{c3} point, hold for 1 hr., then cool in air to approximately 1000 deg., then slowly to room temperature.

For Service Annealing—Heat chain uniformly to above the A_{c3} temperature for complete recrystallization. Hold for at least 1 hr. at temperature and cool in air to a black heat, then slowly to room temperature. The first part of this practice is not in general use and has been given little attention. But its observance contributes probably more to the life and performance of a chain than even the selection of the most suitable material.

To Avoid Wastage of Link Surfaces

While it is true that annealing of chain above the A_{c3} point will correct cold work and eliminate any possibility of gross crystallization, no test or proof is offered that low annealing temperatures will not give the same desirable practical result—that of freeing chain from brittleness—according to C. G. Lutts, metallurgist Boston Navy Yard, in his discussion of Mr. Merten's paper. The practice of low-temperature annealing of chains has been in effect for some years and the results generally have been satisfactory.

One very practical objection against long soakings above the A_{c3} point is that, at such high temperatures, the metal of the chains oxidizes and wastes away rapidly. Frequent treatments at these temperatures are known to shorten seriously the life of chains, because of the rapid decrease in "wire" diameters and the excessive softening of the metal. The choice is between the costly and very severe high-temperature treatment and the possibility that gross crystalli-

zation, if developed with low-temperature annealing, may be found weakening.

As is well known, the severity of cold work determines the beginning of recrystallization and the temperature at which gross crystallization sets in. But the temperature range of 1200 to 1500 deg. Fahr. is one successfully used today for periodic annealing of chains, and instances of gross crystallization are not reported.

It is questioned if the erratic failure of chain may perhaps reasonably be explained on the basis of internal stresses, plus a lack of ductility in the work-hardened surface, plus the added stress, possibly of only a normal working load, which combined exceed the strength of the metal. Does the delicate balance between these internal stresses and the ready susceptibility to intensification or relief explain this erratic failure? It is submitted that a successful attack on the problem of chain failures, and of corrective heat treatments, has to be led with a study of internal stresses and better understanding of them.

Navy Practice with Anchor Chain

Stating that the United States Navy has experimented with anchor chains of wrought iron and also of high-carbon cast steel, Lt. Comdr. H. N. Wallin, Construction Corps, United States Navy, Bureau of Construction and Repair, Washington, continued the discussion of Mr. Merten's paper. The author's views as to cold working of chain in service, with consequent local embrittlement and eventual chain failure, have been substantiated by Navy experience. Often wrought iron chain links of 2¾-in. wire have fractured under small loads, or in some cases when merely dropped upon a concrete floor from a height of 15 or 20 ft.

Usually cold working is accompanied by a reduction in the mean diameter of the chain links, due to the plastic

deformation described. The Navy makes a practice of condemning such chain, so far as anchor use is concerned, when this reduction, whether due to cold working or to abrasion, reaches 10 per cent of the original diameter of the links.

It has been found in Navy practice that relieving of stresses by periodic annealing has greatly reduced the failures of anchor chains. While the combined heat treatment and annealing of chains as proposed would be beneficial, it must be emphasized that neither heat treatment nor annealing is a panacea. Neither one will reconstruct or restore chain which has been excessively deformed by stresses beyond the elastic limit.

It has been determined that high temperatures are required to relieve the strains induced in wrought iron chain by the process of manufacture. For a high grade, double refined iron, the temperature of 1760 deg. Fahr. was found to give the best results. The chain is held at that temperature for about 10 min. and then is cooled in the air. The use of lower temperatures resulted in weaker and less substantial chain, while higher temperatures gave no additional improvement in strength or other qualities.

In the periodic reannealing of wrought iron chain, the United States Navy has found best results were obtained by heating the chain to 1290 or 1300 deg. Fahr., holding it there for 3 hr., and then cooling it in the air or in the furnace. The German Navy, however, reports the belief that heating to 1110 to 1200 deg. Fahr. and holding for 6 hr. gives the best results; while higher temperatures are said to cause considerable wastage of metal from scaling.

Cast steel anchor chain, as used by the United States Navy for the last eight or ten years, is high in both carbon and manganese. The best heat treatment has been found to include heating to 1650 deg. Fahr., quenching in water for one minute, drawing to 1100 deg. and holding there for

News and Sidelights of National Metal Week

A SPECIAL train from Chicago brought about 90 Chicago, Detroit and other steel treaters, gathered in part on the way. By way of diversion a political poll was taken during the trip which revealed about 90 per cent in favor of the Republican nominee.

THE executive secretary, C. E. Hoyt, and the technical secretary, R. E. Kennedy, of the American Foundrymen's Association were interested visitors.

THE Philadelphia Chamber of Commerce tendered a luncheon the first day of the convention at the Benjamin Franklin Hotel in honor of the officers of the various technical societies. The affair was enlivened by a welcoming address by the mayor of Philadelphia, Harry A. Mackey.

TWO foreign steel men, F. C. A. H. Lantsberry and C. L. Bailey, with their wives, were among the visitors. Mr. Lantsberry is an official of William Jessop & Sons Co., Ltd., Sheffield, England, and has attended several steel treaters' annual gatherings. He presented a paper at the Boston convention. Mr. Bailey is from Toronto, and is the manager of the Canadian branch of the same British steel company. He succeeded his father who was the active head for many years.

ALSO present from Great Britain was Charles Wardlow, the present head of S. & C. Wardlow, of Sheffield. He was in the company of his New York

representatives, the Hoyt brothers, and, coming chiefly for the Metal Show, set sail for England on Oct. 13 after barely a week in this country.

IT was interesting as well as profitable to listen to Dr. W. H. Hatfield enter into the technical discussions. He has a happy manner of getting across critical comments, favorable and otherwise.

IF it had been made to order, the weather for the activities of National Metal Week could not have been better. There were five days of sunshine and warmth which made the long distance between the hotels and the Commercial Museum of small consequence. And the excellent taxicab arrangements minimized transportation difficulties.

THE Campbell Memorial lecturer this year, Dr. W. H. Hatfield, must have been gratified at the reception he received. An attendance of about 550 established a record for such a meeting. It tendered him a warm greeting before and after the lecture. Each one of those present was presented with a printed copy of the complete lecture only parts of which were touched on in his one-hour address.

PLANT visitations were, of course, a feature of daily occurrence. The Naval Aircraft Factory, Leeds & Northrup Co., Riehle Brothers Testing Machine Co., Brown Instrument Co., and Victor Talking Machine Co., were among the man-attracting magnets.

A NOTHER prominent British metallurgist will soon visit American co-workers. Ulick R. Evans, Cambridge University, Cambridge, England, is to be the Institute of Metals lecturer in February, 1929.

ANNOUNCEMENT was made in the week that the (British) Institute of Metals will probably visit the corresponding American society in the fall of 1932.

BOTH the president of the American Institute of Mining and Metallurgical Engineers, George Otis Smith, and the secretary, H. Foster Bain, were present during the week. Both spoke at the regular dinner of the Institute of Metals Division.

TWO committees of the American Society for Testing Materials held a meeting in the week—A2 on cast iron and B2 on non-ferrous metals. There was a large attendance at both.

ENOUGH foundrymen were present by chance and by arrangement so that the cast iron committee of the American Foundrymen's Association held a long and profitable session.

TOTAL attendance for the week is reported as 64,870, slightly exceeding that at Detroit last year.

THERE were 2714 members of the A. S. S. T. present during the week, which is slightly in excess of 50 per cent of the total membership.

2 hr. It is not present Navy practice to reanneal this chain periodically, as the stresses in service are well below the elastic limit of the material.

Cast Steel Chain Lightly Loaded

In adopting cast steel chain, definite sizes were selected as substitutes for the same sizes of wrought iron chain. As the cast steel in chain has a tensile strength of 100,000 lb. per sq. in., compared with only 50,000 lb., in the wrought iron, it is believed that the greater strength of the cast steel chain can safely be placed at 60 per cent above the wrought iron, after allowing for all possible variables in the manufacture of the cast steel chain. No failures have occurred during the period of use of this chain on board naval vessels.

More chain trouble after annealing than before was reported by Fred G. Frisbie, metallurgist Duquesne Steel Foundry Co., Pittsburgh. The wrought iron links apparently lose their rigidity after being heated to 1400 deg. Fahr. This causes them to elongate and results in subsequent inequality in the lengths of chains, which customarily are used in sets of two, four or eight. As the chains must be of equal length to carry loads in a horizontal plane, this situation necessitates considerable blacksmith work in bringing the chains back to uniformity of length.

Wear, Overload and Embrittlement

Only two different phenomena are to be considered in this connection, according to A. V. deForest. These are the effect of wear and overload in producing deformation of the chain, and embrittlement occurring without any appreciable change in the appearance or dimensions of the chain. Gough and Murphy of the National Physical Lab-

oratory in Great Britain say that this brittleness is due to a skin effect, caused by surface hardening resulting from small impacts. The deleterious effect of this action is undoubtedly the major cause of the production of brittleness in wrought iron chains.

Evidence available indicates that, as a result of inter-link action, hammering on the ground, rattling through hawse pipes, battering on chain wheels, cleaning by rumbling machine (in certain cases), the material of the surface of the link—in some instances to a very small depth only—becomes locally hardened to such an extent that its ductility is practically exhausted. The link surface then consists of a thin and highly brittle case covering a core possessing the ductile properties of the best chain iron.

Skin Cracks Extend Through Link

When such a link section is subjected to bending stresses—particularly those caused by shock conditions—the hardened skin strains elastically and then cracks. This crack is of such a type that very great stress concentration occurs at its root. When the crack reaches the underlying ductile metal the latter cannot exert its proper ductility, because of the prevailing conditions of local constraint. Hence, the crack continues its course through the section of the link and produces a fracture which has an entirely brittle appearance.

In closing the discussion on the paper, the author expressed the belief that it is the annealing practice generally, rather than deterioration of the chain material, which gives such trouble as is experienced. It must be remembered always that chains are subjected to compound stresses which cannot well be evaluated in advance. These are much more severe than the straight stresses for which they are figured.

Application of Science to the Steel Industry

TAKING the above as a text, Dr. W. H. Hatfield, director of the Brown-Firth Research Laboratories, Sheffield, England, first outlined the problems now awaiting solution, and then proceeded to indicate the way in which science has aided metallurgists in producing the various special steels now available. His paper—which constitutes the Edward De Mille Campbell Memorial Lecture for 1928—occupies 154 pages of the Society's *Transactions*, and obviously must be consulted in the original for the wealth of data on alloy steels which it contains.

At the outset, Dr. Hatfield calls attention to the fact that "pure" science supplies the knowledge of natural laws. It requires long and painstaking research without any thought of immediate financial reward. Yet recent history is so full of instances where great industrial advances have resulted from thorough understanding of these fundamental laws that the speaker advanced the proposition that Governments should encourage such independent investigations by every reasonable means.

No less admirable is the type of mind that can apply abstract physical laws to the improvement of everyday manufacturing or living conditions. It bridges the gap between pure and applied science. But the diversity of knowledge has become so great as to be beyond the comprehension of one educated mind; consequently, really efficient organizations for industrial research (i. e., for the application of science to industry) must contain several specialists with individual laboratories. While it has frequently been said that the scientific man should endeavor to understand the human element in industry, Dr. Hatfield suggested that it is even more necessary "that industry generally should learn to know, to appreciate and to make the best use of the scientist."

Coming to more specific problems, the lecturer cited

the progress made in getting sound ingots. (He is chairman of the British Iron and Steel Institute's Committee on heterogeneity of steel ingots, which presented voluminous reports in 1926 and 1928.) Whereas carbon steel ingots of medium size used to be bottom-cast, small end up, in a closed mold—a method which caused much secondary piping down the axis of the ingot—the present British practice for high-class metal has become standardized upon big-end up, top poured with refractory-lined sink heads. While a marked degree of improvement has resulted from such a change, there is still so much unknown about the physical properties of molten and just solid steel, and about the chemical reactions between metallic and non-metallic ele-

Campbell Memorial Lecturer for 1928

FOR many years Dr. W. H. Hatfield has been associated with the Brown-Firth Research Laboratories, Sheffield, England. His scientific and metallurgical education was received at Sheffield University, where he obtained his doctor's degree. He is a member of the council of the Iron and Steel Institute and of several other societies. His work on stainless and special alloy steels is well known, as are also his contributions to technical societies and periodicals. He is the author of "Cast Iron in the Light of Recent Research," which has had wide circulation in the United States.

Officers Nominated for 1929

President: *Dr. Zay Jeffries, research director Aluminum Co. of America, Cleveland.*
Vice-President: *R. G. Guthrie, metallurgist Peoples Gas, Light & Coke Co., Chicago.*
Secretary: *W. H. Eisenman, who has held the office since the Society was organized.*
Directors for two years: *A. H. D'Arcambal, Pratt & Whitney Co., Hartford, Conn.,*
and F. T. Sisco, Wright Field, Dayton, Ohio.

ZAY JEFFRIES

R. G. GUTHRIE

W. H. EISENMAN

A. H. D'ARCAMBAL

F. T. SISCO

ments at those high temperatures, that further progress by the method of trial and error is bound to be slow.

Dr. Hatfield also selected from his long prepared dissertation the subject of strength at high temperature as being worthy of special mention. It is known that steels will frequently show permanent set after carrying a load for a long time at high temperature. The lecturer believes that as long as a metal remains a crystalline aggregate there will be a range of stress wherein it acts in an elastic manner. This range becomes very small as the melting point is reached, and to determine it for various elevated temperatures requires careful work with equipment of high precision. Table I shows the limiting creep stresses ("the stress above which there is a steady continuous creep of a measurable rate") as determined by the National Physical Laboratory. The same authority states that adding

carbon up to 0.50 per cent is incapable of raising the limiting creep stress above 11,200 lb. per sq. in. at 500 deg. C.

Table I.—Limiting Creep Stress for Low-Carbon Boiler Tubes

Temperature	0.10 Per Cent Carbon	0.17 per Cent Carbon
400 deg. C.		30,000 lb. per sq. in.
450 deg. C.		19,000 lb. per sq. in.
500 deg. C.	7,840 lb. per sq. in.	10,750 lb. per sq. in.
550 deg. C.	2,910 lb. per sq. in.	5,380 lb. per sq. in.
600 deg. C.	1,340 lb. per sq. in.	2,690 lb. per sq. in.

For rapid determinations which have been found useful by designers of equipment, the Brown-Firth Laboratories have devised a test for "time-yield." This arbitrary value is found by discovering the stress at the given temperature which causes a permanent set of 0.5 per cent on the gage length (measured to an accuracy of 0.01 per cent of the gage length) within 24 hr., and no further increase for the next 48 hr.

Important Events of the Week

AT the annual meeting of the society the usual reports of the president, the secretary and the treasurer revealed the excellent condition of the organization. Announcement of the report of the nominating committee for officers in 1929, of which W. E. Reeder, General Electric Co., Schenectady, N. Y., was chairman, was formally accepted. The nominees are mentioned on another page.

The annual banquet at the Hotel Benjamin Franklin was the usual success. An excellent address by E. P. Warner, assistant secretary of the United States Navy for Aviation, was the feature. Douglass Mulloch, the well known poet of Chicago, enlivened the evening with one of his usual able and humorous speeches.

Other important events of the convention are briefly reported in the following:

Howe Medal Conferred on Two Authors

Each year, by recommendation of a special committee and by a vote of the board of directors, a medal—the Henry M. Howe medal—is conferred on the author or authors of

the most meritorious paper printed in the *Transactions* during the previous year ended with July. This year at the annual banquet President Hughes bestowed the medal (two in this case) on Prof. O. E. Harder and R. L. Dowdell, University of Minnesota, Minneapolis, for their paper, "The Decomposition of Austenite," published serially February to July, 1927.

Past President's Medal

A new custom recently inaugurated is the bestowal of the past president's medal, always upon the man who was president the preceding year. The last recipient, R. M. Bird, presented the medal this year at the banquet to J. Fletcher Harper, president during 1927.

Philadelphia Chapter Receives President's Bell

It is customary for the president of the national society to present each year the president's bell to some chapter which has distinguished itself during the year. President Hughes called upon Dr. R. H. Patch, chairman of the Phila-

delphia chapter, to accept the bell, largely in recognition of the heat treatment courses which that chapter has been and is conducting in cooperation with Temple University.

Next Year's Convention in Cleveland

The 1929 convention and exposition will be held in Cleveland, the exact date to be announced later. An annex has been completed for the large auditorium and ample facilities for a large exhibit will be available.

Institute of Metals Dinner

THE "dinner meeting," which only a few years ago was attended by few except the active officers of the division, has grown into the most important social event of the Institute of Metals convention. This year the guests included George Otis Smith and H. Foster Bain, president and secretary of the American Institute of Mining and Metallurgical Engineers, and fifty or more ladies, wives and friends of the members. W. M. Corse, secretary of the division, announced that the British Institute of Metals had accepted an invitation for a joint meeting in America, and it will be held probably in 1932. Dr. Ulick R. Evans of Cambridge University will deliver the annual Institute of Metals lecture in New York early in 1929. Sam Tour, chairman of the meetings and papers committee, has arranged for a series of papers on new aspects of the corrosion problem for that same occasion.

Frederick M. Becket, vice-president Electro Metallurgical Corporation, New York, delivered a formal address on the history and present position of chromium and chromium alloys. He has been investigating these alloys and production methods for chromium and ferrochromium for 25 years, almost to a day of the address. One interesting side-

Howe Medallists for 1928

O. E. HARDER

R. L. DOWDELL

light on stainless iron was divulged by his laboratory records, showing that he prepared a number of these low-carbon high-chromium alloys and exposed them to furnace atmospheres at high temperatures in order to determine their heat resistance properties. Since not a single piece remained to exhibit its peculiar resistance to tarnish at room temperature, the announcement of stainless iron was delayed by several years. Doctor Becket's paper, which is of such a nature that it cannot well be abstracted, will appear later in print.

Widening Application of Products and Equipment Emphasized in Exhibits

ADVANCES in the development of special and alloy steels and demonstration of a wide variety of improvements in the technique of both electric and oxy-acetylene welding were features of the National Metal Exposition held the past week at the Philadelphia Commercial Museum. Although many steel companies were not able to show radical departures from the standpoint of either method or finished products, they were all able to prove important progress in the commercial application of high-grade alloy steels and to show that the steel industry has been able to meet the demand of an exacting industrial structure for specialized products upon a reasonable commercial basis.

But the finished steel products would never have been possible had it not been for the continued evolution in the design and operation of furnaces and heat-treating appliances, of testing and control equipment and of the highly accurate and dependable metal working tools, many of which were in operation in the exhibition hall. Thus the exposition might be termed a complete cross section of the development, manufacture and utilization of steels and alloys during the past year.

The progress and diversification of

heat treating was emphasized in a popular exhibit of one company contrasting the hut of the alchemist of the middle ages with the modern research laboratory. The advantages of different modern methods were ably demonstrated. Electric heat applications of a new and unusual nature were shown by a number of companies, and it would seem that the electric industry is actively seeking outlets for its products in many new fields. Keen interest was displayed in gas furnaces, also, and the many fine examples of units of both the gas and electricity utilizing types indicated that there is ample room in the heat treating industry for a wide application of both forms of heat energy. But in this line of equipment, as in many others, the visitor was not so impressed by departures in design or operation as by the diversity of application which is taking place. The American Gas Association, to illustrate, presented exhibits of its various members and a completely outfitted metallurgical laboratory, the latter covering the efforts of this group to concentrate its activity on individual problems.

New Cutting Tool Introduced

Demonstration of Carboloy, a new cutting tool developed in the research

laboratory of the General Electric Co., attracted considerable interest. It was shown cutting cast iron at a rate of 140 to 160 ft. per min. and occasionally even higher. It is an alloy of tungsten, carbon and cobalt and is a product of the hydrogen furnace. The exhibit included many examples of materials cut with Carboloy and comparisons with the work of high-speed tool steels. Its most economic application is said to be on jobs involving low tensile materials. The development and application of Carboloy was dealt with in a paper at one of the technical sessions and is discussed elsewhere in this issue.

Castings in Group Exhibits

The success of manufacturers producing kindred products to join together in an effort to improve quality was illustrated in the exhibits of the Electric Steel Founders' Research Group, the Steel Castings Development Bureau and the Gray Iron Institute, Inc. These exhibits were confined almost entirely to commercial castings produced for the trade and emphasized general utility work rather than exceptional or difficult applications. Of particular interest in the steel castings group were a turbine diaphragm showing the insertion of the metal blades in the mold as-

sembly, a number of locomotive superheater return bends tested to 6000 lb. per sq. in. and a hardening tray the holes in which had been cast rather than bored. The gray iron exhibit contained a number of castings of interest both from the standpoint of use and manufacture and the electric steel group attracted interest for similar reasons. A visit to any of these exhibits provided convincing evidence of the efforts of the industries represented to secure a wider market for their products by diversity of application.

Testing and Control Apparatus

Testing and control apparatus had an important place at the exhibition, and as usual a number of instruments were shown for the first time. The tendency toward greater precision was emphasized and automatic control features which have been developed recently attracted considerable attention. "Some of the more important innovations were described in the pre-convention issue of *THE IRON AGE*, Sept. 27, and others have been dealt with in more detail in previous issues.

An opportunity to note the recent advances in the welding industry was offered in the American Welding Society's exhibits of welded products as well as by the operating displays of many companies manufacturing welding apparatus and equipment. The booth of the society contained a wide assortment of welded products, including automobile bodies, metal furniture, ornamental iron products, structural steel sections and many others. In another booth part of a welded airplane fuselage was shown. Another interesting welding application was offered in a gas refrigerating unit requiring more than 50 welds and which had been tested to 900 lb. per sq. in.

More than half the exhibits of welding equipment included operating units which drew constant attention. The wide assortment of products offered little opportunity of discerning any particular trend, but it was indicated that the welding industry is making rapid strides in all departments and is quickly achieving the economies in operation which industry demands. Safety features were em-

phasized. A number of companies displayed examples of welding as applied to non-ferrous metals with a number of applications in operation.

May Drop Odd Sizes in Welded Chain

WASHINGTON, Oct. 16.—Manufacturers representing more than 85 per cent of the production of welded chain have unanimously agreed upon a simplification program providing for the elimination of several hundred odd sizes from their list of standard numbers. The Division of Simplified Practice, Department of Commerce, has been requested to call a general conference of manufacturers, distributors and users of welded chain at which the manufacturers' recommendation will be presented for adoption.

Structural Fabricators Take Up Business Problems

A new program for the fabricated steel industry is to be taken under consideration by the American Institute of Steel Construction at its annual convention to be held at Biloxi, Miss., Nov. 13 to 17. During the past four years attention has been concentrated largely upon technical problems and engineering standards. The new program will embrace problems of buying and selling, out of which it is expected to evolve a code of ethics or trade practices.

To introduce the subject in its broad scope, the institute has scheduled three addresses at its annual convention. The buyer's attitude as related to the present competitive conditions among sellers will be discussed by L. F. Boffey, editor of *Purchasing Agent*; and the character of

salesmanship essential to meet present-day economic conditions will be discussed by C. K. Woodbridge, president Kelvinator Corporation, Detroit, and past-president International Advertising Association. Following these, Abram F. Myers of the Federal Trade Commission will address the convention on the powers and duties of trade associations. These three addresses will constitute a symposium on the business problems of the industry.

Puts Pickling Compound on the Market

A new pickling compound, a product of the E. I. duPont de Nemours & Co., will be marketed by the Research Manufacturing Co., Oak Lane Station, Philadelphia. It is stated that it not only removes the scale or oxide, but it stops when it has removed the scale. As a consequence, it conserves the acid content and minimizes the loss of the steel itself. In other words, it is said to contain within itself an inhibitor, preventing over-pickling or pitting of the steel.

Buffalo Forge Celebrates Fiftieth Anniversary

The fiftieth anniversary of the Buffalo Forge Co. was celebrated at the annual three day sales convention of the Buffalo Forge Co., Buffalo Steam Pump Co., and the Canadian Blower & Forge Co., Ltd., held at Buffalo.

Representatives of over forty branch offices of these associated companies were present. The Canadian plants sent salesmen from Kitchener, Toronto, Winnipeg, Montreal and Vancouver. Both the South American and Porto Rican offices had one representative.

THIS plane, owned and operated by E. J. Henke, president American Electric Fusion Corporation, Chicago, was used by him to reach the Metal Exhibition at Philadelphia last week

Business Analysis and Forecast

Steel Industry Has Much Activity Ahead

Demands of Consuming Industries Show Little Let-up—Railroad Orders Not Improving but Construction Remains High

BY DR. LEWIS H. HANEY

DIRECTOR, NEW YORK UNIVERSITY BUREAU OF BUSINESS RESEARCH

WHEN allowance is made for the usual seasonal ups and downs, and for a small factor of long-time normal growth, we find that steel production increased a little in September and was 19 per cent above "normal." This represents almost exactly the same annual rate of production as existed in April and again in July. The unfilled orders of the Steel Corporation showed about the usual seasonal increase in September, and the rate of gain in the adjusted figure was only the same as that which occurred in the preceding month. From this, it may be inferred that new orders have been coming in at a rate that is only a trifle ahead of shipments. The average price of finished steel for the month was about 2.351c., which compares with 2.348c. in August.

Pig iron production, as adjusted, showed a slightly downward trend in September and was only about 8½ per cent above our estimate of normal, against 9.6 per cent above in August. The price of pig iron advanced considerably, the average for the month being \$17.60, which compares with an August average of \$17.11.

The following conclusions seem justified as to the future trend of prices

in the industry: (1) Steel production is too ample to allow much more than continued firmness at the present level of prices. With production 19 per cent above normal, and forward buying no larger than it is, the situation is little better than one of equilibrium. (It is unusually dependent upon the automobile industry.) (2) Pig iron production, however, is relatively low and pig iron prices are cheap. Further advances in pig iron prices seem to be a reasonable expectation during the next two or three months. (3) The situation as to steel scrap is decidedly different from that in pig iron. Scrap is dear. It is too high in comparison with pig iron prices. It seems probable that the scrap markets are very near their peak and that considerable declines will occur before the end of the year.

Steel Activity Exceptionally High

OUR composite steel demand line rose in August and reached a new high point for recent years. This means that average activity in the chief iron and steel consuming industries is high, and continues amply to justify the present high rate of

steel production. The steel output, considering the season, also increased in September, but it is clearly in line with the requirements of the country.

The rise in the composite demand line reflects an increase in activity that was quite general among the various factors included in this index, such as automobile production, railroad transportation, manufacturing, mining and exports. Farm purchasing power was well maintained. Machine tool orders showed a large increase. Only the building industries indicated a decline.

The future promises a sustained high level during the winter months. About the only item that is practically certain to decline is building. The situation here is already reflected in the market for nails, pipe, etc. Residential and other building operations covered by municipal permits will continue to decline. However, a large volume of construction of public works and roads seems assured.

Probably railroad buying will be disappointing, also, as we find that freight traffic in September failed to show the usual seasonal gain, though some allowance must be made for the fact that September this year had only 25 working days. The outlook in

Steel Production Remains in Close Agreement with the Level of Composite Demand. This latter is higher than at any season in recent years

the oil industry is also somewhat less favorable than it was a month ago, production of both crude oil and refined products being a little in excess of demand and declines having been forced recently in refinery prices for gasoline. The situation here is complicated by the fact that increased drilling, while it would bring a demand for some kinds of steel, would injure the oil industry as a whole,

and that would ultimately be unfavorable to the interests of the steel industry. On the other hand, the boom continues in the automobile industry. General manufacturing is much more active than normally and promises to continue at a high rate for several months. The machine tool orders barometer gives a very favorable reading. The general business outlook

indicates a sustained activity and approximate stability near present levels through the winter. One might conclude that the demand for bars will be sustained at about present levels; that the plate demand will continue dull, improvement in some directions offsetting declines in others; that sheet requirements will be sustained at their present high levels; that structural steel, wire and

Building Contracts Have Remained High, But the Strength of Structural Steel Bookings Indicates Considerable Activity in Engineering Projects Other Than Buildings

Buying of Finished Steel Was Higher in August Than in That Month in Any Previous Year Shown. The cumulative total is much the greatest for any year on the diagram

Locomotive and Railroad Car Orders Continue Discouragingly Low. And the surplus of cars is still so large that there is no indication of immediate need for heavy purchases

pipe demands will decline. However, requirements for heavy structural steel should continue large for the remainder of the year.

Sales Highest for Any August

ORDERs and sales figures covering some of the chief items of finished steel made a further gain in August. This is notable as being the first August increase in our sales index since 1924. The latest figure is the highest for the month that we find on record. It brings the total for the first eight months of 1928 to a level much in excess of any similar period, and in all probability assures a new yearly record. It is possible, however, that the third quarter total may not quite equal the third quarter of 1926.

There was a large seasonal decrease in the sales of sheets, in spite of high automobile activity, but the bookings of structural steel, plates and steel castings all gained in August. Sales of steel castings are holding better than usual at this season, and the August increase was the first that has occurred in that month since 1923. Sales of plates showed about the usual seasonal gain.

Greatest Structural Steel Orders on Record

AS to structural steel, it is important to note the building situation. This can be understood only by beginning with the money market. Here we find money rates tight and, in spite of a little easing in October and November, they are likely to continue much above the levels of the last few years. As a result, issues of long-term mortgage bonds for building purposes have declined sharply. Building permits slumped badly in September and were about 10 per cent under a year ago. Contemplated new construction was also smaller, and very low. In fact, the foregoing items are near to the low point reached in 1924. But construction contracts, actually awarded, declined less than usual in September and were about 11 per cent above a year ago. This apparently was due to heavy construction of roads and public works, which items are not covered by permits.

The continued volume of large construction contracts, some of which are not influenced by current business considerations, means large requirements of steel for several months ahead. But the declines in bond issues and in building plans indicate the coming of a reduced volume of awards and ulti-

mately of a lower level of building operation.

Bookings of structural steel usually decrease in August, but this year they gained, rising from 296,300 tons in July to 356,300 tons. Our adjusted index is the highest on record. Nevertheless, it may be noted that the curve of structural steel bookings has acted this year somewhat as it did in 1926, and it is so far above the curve of building contracts that it does not seem that it can continue at present levels very long. Weekly trade reports, however, indicate that the September volume was running at about an average of 36,000 tons a week, in comparison with less than 34,000 tons a week in August.

Locomotive and Car Orders Low

SOME hopes have recently been expressed that the buying of railroad equipment will improve, and better inquiries are actually reported, particularly in the Middle West. The

cold statistics, however, give little evidence of actual gains. As shown in the chart, the trend of freight car orders is still downward and locomotive orders continue close to the lowest levels on record. According to *Railway Age*, domestic orders for steam locomotives amounted to only eight in September, and there is not the slightest indication of improvement, as the total unfilled orders for all locomotives continue near the record low point.

Freight car orders, at 1236, showed a seasonal gain from 767 in August, and were nearly double the orders of a year ago. If any improvement is occurring, it is in this branch of equipment. Surplus cars, though above the level of recent years, have shown a larger than usual reduction since July. But there is still a good surplus, considering the season, and railroad freight traffic has shown little tendency to expand. The gross revenues of the railroads in August were actually lower than a year ago, and this indicates that continued economy will be necessary.

Ohio Employment Gains Steadily This Year

Industrial employment in Ohio has shown an increase every month since the low point of last January, attaining in September the highest level since October, 1926, says the current bulletin of the Bureau of Business Research of Ohio State University. The index for September stood at 111, with an average month of 1923 taken as 100. In the iron and steel industries, the September employment index of 101 was 2 per cent greater than in August and 12 per cent greater than in September, 1927. However, employment during the first nine months of 1928 was 1 per cent less than in the same period of 1927. The number of wage earners in the machinery group decreased 1 per cent from August, but was 3 per cent greater than in September, 1927.

Warwick Furnace Property Brings About \$200,000

At public auction on Oct. 9, 10 and 11, the real estate and equipment of the Warwick Iron & Steel Co., Pottstown, Pa., realized a total of about \$200,000. The equipment was sold for slightly less than \$100,000. This included two blast furnaces with stoves, blowing engines and boilers, a machine shop, blacksmith shop, power house and foundry equipment, several

ore cars, four industrial locomotives, three locomotive cranes, about 10 miles of 90-lb. rails, a 300-ft. span revolving crane and a quantity of scrap.

The Warwick company was incorporated in Pennsylvania June 9, 1899, as a successor to the Warwick Iron Co. The authorized capital stock of the Warwick company is \$1,500,000 in shares, with a par value \$10 each, so that the amount received from the sale of equipment and properties, after deduction of costs, is believed to be sufficient to pay slightly more than 10c. on the dollar.

Russian Commission to Buy Farm Machinery Here

Armed with authority for the purchase of large supplies of tractors, agricultural implements and factory machinery, an official economic mission from Soviet Russia arrived in New York on the *Mauretania* last Friday. A report recently submitted to the Economic Council by the Central Metal Department stated that it will be necessary within the next few years to supply the rural population of Russia with 115,000 farm tractors and well over 500,000 tractor plows, drills, bores and other kindred equipment. It is expected that a large part of this material will be purchased from American companies.

Schedule of the next instalments of the Business Analysis and Forecast, by Dr. Lewis H. Haney, Director New York University Bureau of Business Research, follows: Nov. 1—Activity in Steel Consuming Industries; Nov. 15—Position of Iron and Steel Producers.

Tipple on Wheels Prepares Coal at Dock

Duluth Blast Furnace Company Solves
Problem of Separating
Coking Coal from
Domestic Sizes

A COAL tipple on wheels has been installed on a new coal dock of the Zenith Furnace Co., Duluth, Minn. This traveling plant gives the equivalent of mine preparation of coal, according to a description of N. L. Davis, Link-Belt Co., Chicago, thereby solving the problem of separating coal needed for making blast furnace coke from fuel supplied to domestic consumers.

The coal is delivered to the dock by boat as mine-run and is delivered to separate piles by two electrically operated bridge tramways of the man-trolley type, having a span of 375 ft., and equipped with 10-ton buckets for free digging and a cleanup bucket with 24-ft. spread.

The tipple, which can travel on its own tracks the full length of the dock, can be fed by either of the bridges. An apparent obstacle to the construction of a traveling tipple was the cost of concrete foundations and tracks. This was overcome by designing a flexible tipple structure and rock ballasting the tracks. Wheel loads were reduced to comply with American Railway Association specifications and reasonable limits were allowed for track variations in grade and gage.

The traveling plant prepares domestic sizes and loads them, singly or in mixtures, into box or open-top cars without the aid of chutes. The greatest drop from the time the coal leaves the screens until it is loaded is not more than 8 in. and its greatest ve-

locity is 150 ft. a minute, except in loading box cars, when the speed is limited by that of a box car loader belt. Coal may be loaded simultaneously into cars on four tracks.

Coal is prepared at the rate of 500 tons an hour. If the percentage of slack or smaller sizes in the run-of-pile coal is excessive, the feed to the screens can be increased to maintain full loading capacity in the prepared sizes. The surplus of the smaller sizes is automatically returned to dock storage on a dock return conveyor with which each bridge is equipped. Conversely, if slack is deficient, the feed can be reduced, to prevent overloading the screens. Lump, egg, stove and nut coals are prepared, and any combination of these sizes, or mixtures,

may be loaded, the remaining coal returning direct to dock storage.

The plant has two hoppers, one of 50 tons capacity for stove and nut coal, which serves the stove and nut screens, and one of 70 tons capacity, for slack, which discharges through a motor-operated gate and spout to cars beneath. Both hoppers may be emptied to dock storage in 20 min.

The slack coal requirements of the coke ovens are 800 tons daily. The slack is obtained from three or four kinds of coal, which must not be mixed in handling. During the light shipping season, one or all of the domestic sizes remaining after the slack is removed from the run-of-pile coal must be returned to the storage piles from which they came.

Production of Portland Cement Near Peak

Production of Portland cement is reported by the United States Bureau of Mines to have been 17,856,000 bbl. in September—the largest September production ever reached and the third highest for any month. The figure was exceeded only by August, 1928, with 18,730,000 bbl., and August, 1927, with 18,315,000 bbl. In September, 1927, the total was 17,505,000 bbl.

Production for the third quarter of this year (54,031,000 bbl.) was the greatest for any quarter yet reached. This compares with 53,228,000 bbl. in

the third quarter of last year, and with 48,217,000 bbl. in the second quarter of 1928. For the first nine months production has made a new record, at 131,036,000 bbl., displacing the previous January-September record of 128,286,000 bbl., made last year.

Shipments have been above production ever since the end of April. The amount shipped in September was 20,462,000 bbl., compared with 21,970,000 bbl. in August. The only other earlier month surpassing September in shipments was August, 1927, when a total of 21,411,000 bbl. went out. In September, 1927, shipments were 19,828,000 bbl.

Fabricated Structural Steel

Awards of 34,500 Tons Include Many Small Tonnages— New Projects Call for 13,300 Tons

ALTHOUGH awards in the past week amounted to about 34,500 tons, only a few were in excess of 1000 tons. The largest was 6000 tons for a plant at Asheville, N. C. Another sizable award was 3500 tons for a building in Memphis, Tenn. New inquiries total 13,300 tons, of which 5000 tons is for a section of the New York subway. Awards follow:

NEW YORK, 3400 tons, Y. M. C. A. building in West Sixty-third Street, to Harris Structural Steel Co.; reported last week to unnamed fabricator.

NEW YORK, 2800 tons, Salvation Army Building in West Fourteenth Street, to Hedden Iron Construction Co.; reported last week to unnamed fabricator.

BROOKLYN, 200 tons, building for Brooklyn Ash Removal Co., to Shoemaker Bridge Co.

WILDWOOD, N. J., 400 tons, pier, to unnamed Philadelphia fabricator.

STATE OF NEW JERSEY, 250 tons, highway bridges, to American Bridge Co.

PHILADELPHIA, 1500 tons, addition to Lewis building, to Shoemaker Bridge Co.

PENNSYLVANIA RAILROAD, 3500 tons, 17 small bridges, to American Bridge Co. and unnamed fabricators.

COATESVILLE, PA., 130 tons, girders for Lukens Steel Co., to Massillon Bridge & Structural Co.

PITTSBURGH, 200 tons, ore bridge and river unloading equipment for Davison Coke & Iron Co., to Dravo Contracting Co.

ALBUQUERQUE, PA., 180 tons, addition to Harding High School, to Jones & Laughlin Steel Corporation.

ATLANTA, GA., 1200 tons, Rhodes-Haverty Building, to Ingalls Iron Works.

TAMPA, FLA., 200 tons, airplane hangar and passenger station, to Ingalls Iron Works.

RUSSELLVILLE, ALA., 300 tons, mine improvements for Woodward Iron Co., to Virginia Bridge & Iron Co.

ZAPATA, TEX., 150 tons, International Bridge over Rio Grande River, to Orange Car & Steel Co.

SHREVEPORT, LA., 610 tons, municipal memorial auditorium, to Orange Car & Steel Co.

ASHEVILLE, N. C., 6000 tons, American Enka Corporation plant, to Virginia Bridge & Iron Co.

MEMPHIS, TENN., 3500 tons, Sterick Building, to Virginia Bridge & Iron Co.

NEWARK, N. Y., 500 tons, State Teachers' College, to R. S. McMannus Steel Construction Co.

PLYMOUTH, MICH., 1445 tons, factory building for Chrysler Corporation, to Whitehead & Kales Co.

SAGINAW, MICH., 300 tons, Adams-Saginaw Building; relet by Flint Structural Steel Co., to Massillon Bridge & Structural Co.

STATE OF MICHIGAN, 100 tons, highway bridges, to Massillon Bridge & Structural Co.

DETROIT, 950 tons, craneway No. 37 and Clayton-Lambert Building for Fisher Body Corporation, to Massillon Bridge & Structural Co.

DETROIT, 150 tons, building for Wood Hydraulic Hoist & Body Co., to Massillon Bridge & Structural Co.

AKRON, OHIO, 800 tons, building for General Tire & Rubber Co., to American Bridge Co.

NEWARK, OHIO, 120 tons, building for Pennsylvania Railroad, to Pittsburgh-Des Moines Steel Co.

MADISON, IND., 300 tons, caissons and coffer dam for bridge, to St. Louis Structural Steel Co.

CHICAGO, 1000 tons, addition to Chicago Club, to A. Bolter's Sons, local.

DU QUOIN, ILL., 300 tons, coal tippie for United Electric Coal Co., to St. Louis Structural Steel Co.

APPLETON, WIS., 500 tons, bridge for Chicago & North Western, to Wisconsin Bridge Co.

MILWAUKEE, 100 tons, addition for Oilgear Co., to Worden-Allen Co.

DAVENPORT, IOWA, 550 tons, bridge for Rock Island Railroad, to American Bridge Co.

HERMAN, MO., 1800 tons, bridge, to Kansas City Structural Steel Co.

CHELAN, WASH., 124 tons, Cashmere bridge, to Pittsburgh-Des Moines Steel Co.

SEATTLE, 100 tons, West Seattle school, to Isaacson Iron Works.

SEATTLE, tonnage unstated, coal pulverizing plant for Pacific Coast Cement Co., to Hofius Steel & Equipment Co.

PORT ANGELES, WASH., 125 tons, addition to Washington Pulp & Paper Co. plant, to Isaacson Iron Works.

BAYWOOD, CAL., 170 tons, apartment building, to Judson-Pacific Co.

SAN FRANCISCO, 2000 tons, power plant

for Great Western Power Co., to Dyer Brothers.

PITTSBURGH, CAL., 2500 tons, tin plate mill for Columbia Steel Corporation, to McClintic-Marshall Co.

PITTSBURGH, CAL., 450 tons; open-hearth furnace, 300 tons and machine shop, 150 tons for Columbia Steel Corporation, to Dyer Brothers.

LOS ANGELES, 2000 tons plates, five 134,000 bbl. tanks for General Petroleum Corporation, to McClintic-Marshall Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

NEW YORK, 5000 tons, subway section 6, route 109; bids Oct. 26.

NEW YORK, 2000 tons, 15 barges for New York Central Lines, Dravo Contracting Co. and Atlantic Ellis Co., low bidders.

BROOKLYN, 5000 tons, addition to St. George Hotel; Schroeder & Koppell, Inc., general contractor; reported last week as 2500 tons.

BALTIMORE, 500 tons, Y. M. C. A. building.

STATE OF TENNESSEE, 1300 tons, two highway bridges for State Highway Commission.

MOBILE, ALA., 450 tons, shops for Louisville & Nashville Railroad.

TALLEDEGA, ALA., 750 tons, factory for Bemis Bag Co.

WOLF POINT, MONT., 700 tons, bridge across Missouri River.

OAKLAND, CAL., 170 tons, Jackson Creek spillway for East Bay Municipal Utility District; general contract to Ward Engineering Co.

PORTLAND, ORE., 243 tons, Gardiner bridge over Yellowstone River in Montana; Illinois Steel Bridge Co., low bidder.

Distributors Protest New Sheet Discounts

ATLANTIC CITY, N. J., Oct. 16.—Re-affirming a resolution adopted at a meeting held in Pittsburgh in September, members of the Metal Branch, National Hardware Association, at a meeting here today, again urged producers of sheet steel to reconsider their new policy of reducing the discount on sheets from 2 per cent for cash in 10 days to 0.5 per cent for cash in 30 days. The new discount terms were adopted by all the principal makers of sheets as effective Oct. 1.

The resolution adopted at Pittsburgh, which was printed in part in THE IRON AGE of Sept. 13, page 640, urged the mills to consider the old discount not as an allowance of interest charges, but as a premium for prompt payment of bills. It was suggested at the meeting here today that, with the present small discount allowed by the mills, distributors would be inclined to allow payment of sheet bills to run as long as possible, paying first the statements allowing a larger discount.

Will Not Pass Increased Charges to Customers

Considerable discussion arose at the meeting as to the advisability of passing along the increased charges of the distributors by reducing their discount to jobbers, sheet metal workers and other customers to a corresponding

figure. An informal ballot revealed that 43 of the distributors represented will maintain the old 2 per cent discount to their customers while four have adopted the new terms introduced by the mills for their trade. It was brought out that one warehouse has sought to offset the reduced profit in sheets occasioned by the lessened discount by advancing the price \$2 a ton.

Nearly all the distributors present stated that they could not afford to lower the discount to jobbers at present because they would not be able to stand the increase in accounts receivable which would be almost certain to follow. It was brought out that about half the average distributor's customers had been trained to take advantage of the 2 per cent discount, and that its withdrawal or sharp reduction would take many of these customers out of the prompt payment class.

An organization has recently been set up in Czechoslovakia for the production and sale of steel houses, according to a report received from Consul General Arthur C. Frost, Prague. The company has acquired some foreign patents and plans to sell and erect these houses throughout Czechoslovakia. It is proposed to use only Czechoslovak products in the manufacture of the steel houses so far as it is practicable to do so.

This Issue in Brief

Suggests medium-carbon silico-manganese steel as a substitute for some of the best alloy steels. The silico-manganese steel is cheaper, is easily heat-treated, and compares favorably in physical properties with the alloy steels.—Page 957.

* * *

Fatigue failures frequently occur at sharp corners, keyways, screw threads and tool marks where there is a concentration of stress. Fatigue cracks also originate in clusters of slag particles.—Page 958.

* * *

New tool material cuts cast iron at a rate of 140 to 160 ft. a minute. Tungsten carbide bonded with cobalt ("Carboloy") will scratch sapphire and cut a groove in an alundum wheel. It is claimed to be much superior to high-speed steel, and capable of sustained cutting at speeds several times those commonly used.—Pages 959 and 972.

* * *

Chips will not adhere to cutting tool in machining high-chromium steels, if the steel contains zirconium sulphide, metallurgist declares. Sulphide does not reduce resistance to corrosion, but it does lessen ductility.—Page 953.

* * *

Cuts in half hardening time by conducting nitriding operation at a pressure of 600 mm. of mercury above the atmosphere. Thirty hours are required to get a scleroscope hardness of 90, regardless of pressure. Higher pressures give a deeper case.—Page 954.

* * *

To render sling and crane chains entirely safe for further service, without reducing safety load, they should be heated to a temperature considerably above the transformation range, says metallurgist. But at such high temperatures the metal oxidizes and wastes away rapidly, says another.—Page 960.

Traces gear noises by means of an instrument consisting of a portable cylinder and piston connected to ear-pieces. In device used by Westinghouse the piston is moved in the cylinder until the air column in the latter is in resonance with the sound from the machine.—Page 948.

* * *

If gates on molds are too large, the pouring gate cannot be kept filled during pouring. This permits impurities to enter the mold. Accordingly, it is wise to choke the flow somewhere between the ladle and the mold.—Page 944.

* * *

Suggests how a low-cost rustless steel may be made. A low-chromium steel, containing about 0.50 per cent copper, can be made in open-hearth furnaces, says metallurgist. It would occupy a position between stainless iron and plain copper-bearing steels or ingot iron.—Page 954.

* * *

Water-quenching of silicon steels produces superior physical qualities. If the steel is alloyed with 1 per cent chromium, about the same results are obtained from oil-quenching as from water-quenching.—Page 957.

* * *

Hardens high-speed steel tools in salt bath at 2400 deg. Fahr. without injury to the tools or furnace. New process is claimed to be fumeless and low in cost.—Page 956.

* * *

Alloy steel spring failures found to be due to slag inclusions. Engine builders have eliminated spring failures by using springs of high-carbon piano-wire steel.—Page 958.

In lapping gears the abrasive should be selected for the softest gear in the pair or train. Otherwise the soft gear will be harmed. No one abrasive is suitable for more than a few types of gears, says abrasive manufacturer.—Page 949.

* * *

True criterion of the transverse strength of cast iron is the modulus of rupture determined for the actual bar section, measured at the point of rupture, says British expert. By concentrating on standard bar test, relations between size and strength, and composition and strength, may be determined.—Page 952.

* * *

Warns against hardening steel too much for the particular type of steel used. If the hardness exceeds what the steel is made for, failure in service may result, metallurgist declares.—Page 959.

* * *

Doctor Haney looks for higher pig iron prices and lower scrap prices. "Further advances in pig iron prices seem to be a reasonable expectation during the next two or three months," says forecaster. "It seems probable that the scrap markets are near their peak and that considerable declines will occur before the end of the year."—Page 966.

* * *

United States is a more important factor in steel export market than statistics indicate. Though our steel exports are exceeded by those of four European countries, a great part of their business is among themselves, while virtually all of our steel exports go to non-European areas.—Page 947.

THE IRON AGE

W. W. MACON
Managing Editor

ESTABLISHED 1855

Cutting Harder and Faster

PROBABLY the most important feature of Metal Week in Philadelphia was the disclosure of a new tool substance and its demonstration at the Commercial Museum. Rumors of a super-hard material used abroad for drawing dies had been coming over for several years. Returning visitors from the Krupp plant had reported seeing some super high-speed steels in action; it was said that these materials were made of metallic carbides cemented together with less brittle materials. American metallurgists turned their attention to these possibilities. Yet all the time, in the words of H. J. French of the Bureau of Standards, the machine tool users were like beggars looking into a restaurant window—a most desirable material was dangled before their eyes with no possibility of getting any.

Now comes Dr. Samuel L. Hoyt of the General Electric research laboratory, and describes a substance to be marketed under the name of carboloy, which, in view of his modest presentation of facts, constitutes the greatest single advance in the art of cutting metals since the announcement of the Taylor-White method of heat treating tool steels. One important distinction needs to be made. The high-speed steel was an important advance over the carbon tool and the air-hardening tool because it cut mild steel six or eight times as fast. But it is not essentially a hard substance, nor did it prove to be useful on material which could not satisfactorily be cut at a slower rate by the old tools.

This recently invented combination of tungsten carbide and cobalt is intrinsically hard—three times as hard as the old tools—and not only appears to be able to stand against steel satisfactorily at largely increased speeds, but also can cut tough or abrasive materials (like aluminum bronze, manganese steel castings, chilled iron, bakelite and carbon products) which hitherto have worn down the cutting edge of the best tools in short order. In fact, we are informed that the General Electric Co. is using many of the new tools in production on insulating materials, not previously machinable.

It is interesting to remember the chemical relationships of our tools. Carbon tools owe their hardness to their content of iron carbide; the cementing material is the soft iron, ferrite (but according to Jeffries and Archer's theory, hardened because of its excessively fine grain after quenching). After 1870 it became generally known that tungsten and chromium combined with high-carbon steel slowed down the softening reactions, so a drastic quenching would be unnecessary. Tungsten, chromium and iron carbides thus combined to make a steel which was hard after slow cooling. So-called Mushet steels were used

on hard castings, although they satisfactorily run on steel twice as fast as the carbon tools.

The third era in tool steels dates from 1900 when Taylor and White disclosed the fact that, if these air-hardening tungsten-chromium steels were cooled from a sweating temperature and given a high draw, they would retain their hardness up to a red heat. Consequently another doubling of machine speeds was possible because friction from the chip which would temper the older tools had no effect on the newer high-speed steels.

A fourth doubling in cutting speed came a few years later when the optimum composition in tungsten, chromium, carbon and vanadium was worked out—a problem which Dr. J. A. Mathews did much to clarify. In all this half century of advance, it can be seen that the revolution in machine shop practice was primarily due to the hardening and stabilizing effect of tungsten, chromium and iron carbides in the complex tool steel. More recently the addition of cobalt in amounts up to 15 per cent has been found to increase the cutting speed of some tools even further and to give a more durable cutting edge at a red heat.

Meanwhile Haynes had discovered stellite, a family of alloys essentially of tungsten, chromium and cobalt, intrinsically hard and requiring no heat treatment. This soon established itself for machining hard cast iron ("semi-steel") and for rough turning medium steels. The new German die alloys, described in *THE IRON AGE* of Aug. 16, seem to be of this general class. But this swing to hard metals seems to be a passing phase. The new tool material described by Doctor Hoyt again comes back to a hard carbide of tungsten with softer cobalt metal as a binder. Tungsten, chromium, cobalt—metals and carbides—are the leading actors in this metallurgical pageant.

About all that can be said at this date, is that the new tool materials open up a wide vista of possibilities. That they will meet some impediments (such as cost, brittleness and competitive exploitations) cannot be doubted. It is too much to expect that they will render obsolete all our present practice; but that they will have a profound influence on numerous aspects of machine shop operation cannot be doubted.

Winning the Fight on Corrosion

NONE who heard the papers on stainless iron at the steel treaters' meeting in Philadelphia last week, or listened to the summary of the advances in chromium steels and irons given by Dr. F. M. Becket at the Institute of Metals dinner, could fail to appreciate that excellent progress has been made. Many grades of rustless iron and of the higher chromium alloys have been perfected and are in use in a widening range of industries.

One company has been producing nitric acid on a large scale by the fixation of atmospheric nitrogen since it was found that rustless iron was adaptable to the process. About 1200 tons of the alloy at a cost of nearly \$1,500,000 is now employed or on order for this purpose. Ultimate independence of the Chilean nitrate fields thus becomes a possibility. In the oil industry these alloys have revolutionized processes and made possible larger yields of gasoline for the automotive industry. Here the demand for non-oxidizing, strong metal that shall maintain these properties under high temperatures seems to have been met.

The battle against corrosion has been long and hard fought. For years theories of its operation have been controverted and many methods of combatting it have had and are still having their day. Meanwhile, steel replacement on a large scale, prodigal as that waste has been, still holds the preponderance in the economic argument, so costly is any metal that can guarantee immunity. Yet all signs indicate steady progress on the commercial as well as the metallurgical side of the problem.

Lessons from the Scrap Rise

THE rise in steel scrap prices in the last few months suggests that the mills return to the carrying of stocks—a policy from which they departed only recently. Heavy melting steel scrap has advanced \$4 a ton in the Pittsburgh district, \$3 in eastern Pennsylvania and about \$2 at Chicago. Such an advance was quite unexpected and has attracted much attention. It may be argued that at the new levels scrap has merely approached its “intrinsic” value, relative to pig iron; but if so it was previously much too low. The point is that in an era of relatively steady commodity prices all around such swings seem out of keeping.

The mechanism of the scrap market has changed altogether in recent years from that of pre-war time. Then there were two classes of swings, a seasonal swing with the low falling commonly about the middle of the year, and a swing in keeping with the longer term swings in steel activity and finished steel prices. It will no doubt be recalled that steel prices used to indulge in general and marked swings.

Under the old conditions the dealers took care of the matter of supplies. Having in mind what seemed to be the normal seasonal swing, and being able more or less to foresee the longer term swings, they accumulated yard stocks after prices had had some considerable fall, feeding them out after there had been some substantial advance. Freights were lower then, and a total swing of \$4 a ton in the market was sufficient to give the dealers a good trading basis. Some of the swings were greater than that, but they were not out of line, as finished steel prices also had their swings.

It is quite clear that the outcome of scrap, from original sources, does not fluctuate with the varying needs of the steel mills, either in point of time or point of volume; hence the need of a reservoir or receiver somewhere. When the mills are increasing their operating rate they need particularly large quantities of outside scrap, since it takes time for their supplies of works scrap to increase. Later on, as the increased steel production comes to be used, the supply of industrial scrap increases. When the rate of steel produc-

tion is decreasing the mills still have their works scrap and require correspondingly less from outside, while industrial scrap continues to pour into the situation.

In short, the natural outcome of scrap varies at exactly the wrong time. Its swings are always too late for mill convenience. Dealers are unable to operate along the line of accumulating scrap at one time and feeding it out at another, as they used to do. For one thing, freights and cost of handling are much higher. For another thing, mills are so particular about their costs that they would hesitate to pay advanced prices when dealers' yard stocks were visible, and finally there is keen and relentless competition between dealers. Many dealers have disappeared in the last few years, having lost all they had or all they cared to lose.

It would seem clear that when the dealers are unable to carry stocks the mills should do so, and naturally there should be more resort to duplexing, a process not so much in vogue recently, while it used to be a great aid in smoothing things out. Thus in 1914 only 3.7 per cent of the total ingot production came from duplexing while in 1916 the proportion was 8.3 per cent. Then again in 1920 the proportion was 8.0 per cent and in 1921 it was only 4.4 per cent, while the actual tonnage of duplex ingots was only one-fourth that of 1920.

Self-Interest in the Public Interest

“AMERICAN industry faces no more important task today than that of protecting the buying power represented by wages.” This expression by Eugene G. Grace, president of the Bethlehem Steel Corporation, is the accepted opinion of most industrial executives today. But when we compare it with the view that prevailed less than a generation ago, such recognition of the dependence of prosperity upon high buying power of wage earners is seen as a virtual revolution in economic thought.

Not so many years back there was agitation against “predatory wealth” and “special interests” on the ground that the building up of large fortunes was at the expense of the public and against the general welfare. This unrest had some basis in the unenlightened selfishness of certain of the earlier leaders in industry. The millennium has not come in, but a marked change has taken place in the common conception of self interest. Management no longer looks upon high prices and low wages as the twin prerequisites of profits. The consumer no longer fears extortion at the hands of industry. Nor does labor now believe that its bargaining power is its sole guaranty of a fair wage. And little is now heard of an essential and irrepressible conflict between employer and employee or between producer and consumer.

Mechanization of industry is yielding economies that cannot be converted into profits without a large volume of business, and volume is impossible unless buying power is high and widely diffused. Protection of the buying power of wages is of general concern. Management must find still more ways of increasing efficiency; labor must whole-heartedly support these innovations. That view is now widely held and will doubtless find its way in time to the less progressive branches of industry where old antagonisms and old issues persist. The partnership of employer and employee on the one hand, and of producer and consumer on the other, is

based on realities; in fact, it conditions the continuance of national prosperity.

More Work, Less Fuel

PRELIMINARY estimates of this year's production of coal, petroleum and natural gas indicate a decrease from last year of 4 or 5 per cent, when the fuels are brought together on a heat unit basis. Yet there is no doubt that more work is being done this year than last. Even in a single year we seem to have made distinct progress in getting more results from our fuels.

From the viewpoint of the fuel producing industries the trend has been very unsatisfactory. The forecast here made involves estimates of changes in production from 1927 to 1928 as follows: Bituminous coal, 6 per cent decrease; anthracite, 9 per cent decrease; petroleum, an even break or a slight increase; natural gas, about 7 per cent increase.

Of course, the coal industry does not complain of its poor production, for it is always feeling that production runs too heavy. What it does complain of is the poor demand. The oil industry on the other hand has to submit to its production, which it considers altogether too high. When it comes to natural gas there is another situation. Little complaint is made of production or demand. Natural gas has been awaiting a

greater outlet through the construction of pipe lines, the Pan Handle field of Texas and the Monroe field of Louisiana having much gas held back awaiting lines to markets, some of which are now being built. Our estimate of 7 per cent increase in natural gas production is merely a projection of the rate of increase in the two preceding years. There are no current reports on gas production as in the case of both coal and petroleum. Next year promises a large increase in natural gas which, as indicated, is largely a matter of ability to reach markets.

Both petroleum and natural gas this year attain new high percentages of the total fuel production, when figured on a heat unit basis, through the influence of a decrease in coal and, in the case of natural gas, an increase in its production. On a heat unit basis the fuels run this year approximately as follows: Bituminous coal, 63 per cent; anthracite, 9 per cent; petroleum, 21 per cent; natural gas, 7 per cent.

In later years we are quite likely to see the natural gas percentage increase, for a long life is promised for the fields. In petroleum the talk is of relatively early exhaustion, but we have now had that talk for so many years that many will doubt. Economies in the use of fuel promise to continue, as best practice of one time extends to the average while itself improving. Over a period of years coal production is likely to have little if any increase.

To Legalize Resale Price Contracts

Advocates of Kelly-Capper Bill Hold That It Will Aid
Smaller Manufacturers and Independent Dealers
and Still Preserve Competition

WASHINGTON, Oct. 16.—Again an effort will be made at the forthcoming session of Congress to pass a bill legalizing the maintenance of resale prices. Representative Kelly of Pennsylvania and Senator Capper of Kansas, authors of an identical measure now pending and known as the Kelly-Capper price standardization bill, say that it will be passed at the next session. On the other hand the general view is that, as with similar proposed legislation in the past decade, it will be defeated.

Price Stabilization the Aim

Proponents of the bill point out that extensive hearings on the subject, as well as public discussion, have dispelled the once popular idea that it entails price fixing and instead have shown that it means price stabilization, elimination of price cutting, and protection against inferior products. On these grounds it is argued that such a law would be to the advantage of the manufacturer, distributor and consumer. Its supporters point to the fact that a favorable report on the Kelly-Capper bill was made to the House Committee on Interstate and Foreign Commerce by a subcommittee of that body at the last session of Congress. They also expect that the inquiry now being made on the subject by the Federal Trade Commission will disclose a favorable attitude on resale price maintenance. The commission will make its report to Congress early in December.

Opponents of the bill contend as heretofore that it affords opportunity for manufacturers and distributors to gain advantages at the expense of consumers and therefore that it is not in the public interest.

The legislation covers only trade-marked or branded ar-

ticles, or so-called standard merchandise. In making its favorable report, the subcommittee of the House Committee on Interstate and Foreign Commerce presented an amendment to the bill which permits disposal of stock without regard to agreed prices, when the owner discontinues dealing in such commodities as are covered by the bill, and gives like exemption to dealers when disposing, toward the end of a season, of a surplus stock of goods especially adapted to that season.

Competition Not Eliminated

It is argued for the bill that the public would not suffer by any undue increase in price, because the measure specifically provides that any contract between maker and seller must relate only to an article which is in fair and open competition with commodities of the same general class produced by others. The point is also made that it is now generally accepted that a large volume of sales at a small profit is better than a small volume at a large profit and that if any producer of trade-marked articles unduly increases his price his competitors are sure to invade his market with lower prices.

In these days of mail orders and chain stores, it is urged, it is certain that these aggregations, in case they do not get fair prices from manufacturers of standard articles, will have the desired articles specially made for them and will sell them at much lower prices. Testimony is said to show that local dealers suffer destructive competition from these chain stores and other large distributors with great capital, who, it is alleged, offer standard goods of nationally advertised brands at prices which represent cost, or in some

cases less than cost. They are said to do this for the purpose of attracting customers, making up their loss on a standard article by greater profits on staple goods on which there are no standard or advertised prices. Such a practice, it is contended, not only works to the detriment of a local dealer but also interferes with, if it does not destroy, the business of the manufacturer of such standard articles in the particular town affected. Such methods force the independent dealer to take these goods out of stock, leaving their sale to chain stores which, it is claimed, can dictate to the manufacturer the price at which they will purchase his goods.

Tendency to Gradual Price Reduction

Makers of standard trade-marked goods, it is pointed out, have to rely primarily on quality for a large and continuous demand on the part of the public, but with unfair competition there is a strong pressure on the manufacturer to make his goods for a price and not primarily for quality. On the other hand, it is contended, if the dealers in standard trade-marked articles buy them under proper resale price agreements the quantities of these articles handled in

the aggregate would be so increased, both because of public demand and because the dealers will be anxious to handle them at a fair profit, that the quantity production will of itself cause a gradual reduction in cost and also in price.

The further point is made that large manufacturers are now able to maintain fair control of retail prices, while smaller manufacturers have not the resources to protect themselves against destructive practices.

Representative Lea, in a dissenting report, said that he was reluctant to interfere with the right of a buyer of property to dispose of it on any terms satisfactory to himself. He considered that the public is not interested in merely protecting profits or permitting an arrangement that arbitrarily fixes profits. Competition without misrepresentation, on a close margin, is not against public interest. Representative Lea said he could not join in the majority report unless the protection of a contract was so limited as to confine it either to costs or a moderate percentage above the purchase price of the dealer, which he fixed at 10 or 20 per cent. Such a margin, he held, would prevent sales below cost and not be open to the criticism of fostering unreasonable profits.

CORRESPONDENCE

The Chance of the Small Manufacturer

To the Editor: As a long-time reader of THE IRON AGE from cover to cover, I was much impressed by your editorial "Cheapness at a Price," appearing in your Oct. 11 issue. The facts summarized there merit the serious attention of the small manufacturer, but I do not believe he need become pessimistic in view of this editorial.

Whether we wish it or not, larger and larger corporations with their obvious economies have come to stay and if the smaller manufacturer seeks to compete with them on their own ground he is doomed to failure. The advantages, however, of the larger corporation hold only within certain bounds, and the determination of those limits is one of the serious problems of the small manufacturer. Once outside the bounds wherein lie larger purchasing power, greater mass production, greater resources for wide distribution, and the advantages of superior technical leadership, the small manufacturer can meet the large corporation at even or perhaps better terms. Once outside of those limits, the advantages of the small manufacturer are far too numerous to detail here, but that they exist is proved by the large percentage of the country's business that is still done by the smaller firm.

One particular advantage is in the specialty field. Mass production plus mass distribution requires a standardization of products which makes it very costly for the large corporation to make and sell non-standard or specialty material. Some specialties are so limited that it is hardly worth while to go into them. On the other hand, many specialties are destined to great growth; in fact, it might be said that the specialty of today becomes a standard product tomorrow. The small manufacturer exploiting such a specialty and growing with it will become the large manufacturer of tomorrow.

It seems odd, perhaps, for us to think of steel as a specialty; and yet, when the Bessemer was first introduced iron was the standard mass product and the pitiful output of the first Bessemer was a specialty which it was conceded might have some future in the manufacture of steel rails; but as for general use—well, that was another matter. And now look at the beast. It has grown to the point at which not only has steel manufacture become a standard mass

production, but many steel specialties have grown to the standard status. We can all remember that but a few decades have passed since these specialties were born—the automobile, the radio, the talking machine, the airplane, the skeleton steel building.

The smaller manufacturer can stay in business by developing a specialty, preferably one protected by patent or other method of whole or part monopoly. If he picks the right specialty now, there is nothing to prevent his becoming a large operator later on.

CROSBY FIELD.

Brooklyn, N. Y., Oct. 15.

Rapid Corrosion Tests for Coated Steel

Investigation by the Bureau of Standards, Department of Commerce, indicates that, in the case of zinc-coated steel, the bureau's simulated atmospheric corrosion tests produce an effect that more closely resembles corrosion in service than the spray test.

Since it is important to develop a test that will give some indication of the probable life of the product, the bureau has made a thorough study of the two test procedures now in use. The simulated atmospheric corrosion test employs a moist gaseous mixture of sulphur dioxide, carbon dioxide and air, while the spray test uses normal solutions of sodium chloride or ammonium chloride. The time required for breaking down the zinc coating was considerably less with the first test than with the second, and the coating was broken down in a more consistent manner.

No attempt was made to interpret the experimental results in terms of service life under the many atmospheric conditions that are found in different climates. Any satisfactory attempt at such an evaluation must await the results of long-time field tests on zinc-coated products, conducted under typical conditions obtaining at different locations. A complete account of this work is given in Research Paper No. 10 of the Bureau of Standards.

The "Blaster's Handbook," issued by the Explosives Department of the E. I. du Pont de Nemours & Co., Wilmington, Del., has been revised. New matter includes a description of the character and uses of pellet powder, a relatively new type of explosive in the United States for use in coal mines. Sections are devoted to ore mining, coal mining and tunneling revised as to new practices.

Iron and Steel Markets

Prices Show Further Strength

Heavy Rolled Products \$1 to \$2 a Ton Higher on Prompt
Tonnages—Advances in Scrap, Coke and Pig Iron—
Demand for Automobile Steel Dips

FOLLOWING the heavy bookings of recent weeks, new business in steel is at a reduced rate, but the upward movement of prices has not yet run its course.

Further evidences of strength in finished steel, in some instances attributable to extended deliveries, are matched by additional advances in scrap and pig iron and a slight rise in blast furnace coke.

Steel production holds at close to 90 per cent of ingot capacity, and little, if any, recession from that rate is looked for this month. With mill backlogs large and consumer commitments of like proportions, the decline in new orders is not surprising. The view is still held that the rush of business in September was partly due to the advanced prices named for fourth quarter and that consumers' reserve stocks have been built up to some extent.

On the other hand, pressure for deliveries is still insistent, and the leading producer of sheets is operating several plants an extra turn each week to speed up shipments.

Not a few consumers who failed to anticipate their needs are embarrassed by the heavy commitments of the mills on some products. Their pressure for prompt material, although usually in small tonnages, has resulted in a further strengthening of prices on the heavy rolled products. Bars, and in less degree plates and shapes, are commanding \$1 to \$2 a ton more than the prices at which fourth quarter contracts were closed.

An advance of \$2 a ton on cold-rolled strips to 2.85c. a lb., Cleveland or Pittsburgh, is being widely adopted. Order books are reported to be the largest in over three years.

Pressure on the mills is not uniformly strong throughout the country. A decline in specifications at Chicago is ascribed largely to slackening operations in the automobile industry. Chicago steel output is still at a rate exceeding 85 per cent, and mill operations in other producing centers dependent on motor car steel have not yet been affected. A number of automobile manufacturers will shut down two or three weeks in November for inventories, and their steel requirements upon resuming operations will depend on the motor car demand at that time. Purchases by the Chevrolet company, which will start production on new models next month, are expected to offset the decline in orders from other plants.

Steel production has been reduced in the Birmingham district, where five open-hearth furnaces were put out following the shutting down of the Ensley rail mill.

This action is of temporary significance, marking the completion of 1928 orders. The rail buying movement for 1929 has been under way for several weeks. Following closely the purchase of 46,622 tons by the Erie a week ago, the Santa Fe has distributed orders for 119,637 tons. In addition, the Reading will divide 30,000 tons between a Pittsburgh and an Eastern mill. New inquiries include 190,000 tons for the New York Central and 30,000 tons for the Texas & Pacific.

Farm implement plants are taking steel at an undiminished rate, and shipments to them so far this year have been the largest in history.

Unfilled orders of pipe mills are being slowly reduced. While demands from the oil and gas industry have declined, a projected natural gas line from Ventura, Cal., to San Francisco will call for 50,000 tons of steel.

Basic pig iron in eastern Pennsylvania has advanced 75c. a ton on purchases of 5000 tons. An inquiry in that district for 20,000 tons of basic iron is from a steel producer that bought 25,000 tons 30 days ago. Prices are also stronger in foundry grades in the Central West, where Lake furnaces have booked some first quarter business. A Valley producer of low phosphorus has announced an advance of 50c. a ton to \$27, furnace.

Heavy melting steel scrap has advanced another 25c. a ton at Pittsburgh and St. Louis and \$1 a ton at Detroit.

Spot furnace coke, under the influence of orders from blast furnaces supplementing contracts, has advanced 10c. to \$2.85 a ton, Connellsville.

The new card of extras on hot-rolled strip recently announced by an Ohio mill has been adopted by a number of producers, although others may decide to quote two base prices instead of only one.

Tin plate prices for the first half of 1929 will probably be announced in the next 30 days. A cut in the cash discount from 2 per cent to 1/2 per cent is also expected.

In Europe a changing situation is indicated. A diminishing steel demand, exports included, now is reported, accompanied by some price recessions.

Both of THE IRON AGE composite prices remain unchanged. That for pig iron, at \$17.84 a ton, is exactly the same as a year ago. The finished steel composite, at 2.362c. a lb., compares with 2.307c. twelve months ago.

Pittsburgh

Steel Orders Lighter, But Continued High Production Is Assured Through October at Least

PITTSBURGH, Oct. 16.—Steel plant engagement in this and nearby districts still is averaging 90 per cent of capacity. There is no indication of a recession this month from that rate. While the amount of business entered on mill books in the past week has been less than in the first week of October, this appears to be largely in line with expectations after the heavy flood of orders and specifications in the latter part of last month.

Aside from wire, tin plate and pipe mills, there are commitments sufficient to provide full occupation of rolling capacity for the month. Lighter new purchases, however, suggest that the mills will cut extensively into order books at the present rate of activity. Whether a 90 per cent production of ingots can be maintained beyond this month will depend on the volume of business a few weeks hence.

Rail tonnage is reaching the mills in good volume, but against that are definite signs of some letdown in automobile production. There is sustained demand for steel for building and construction and for agricultural implements. The demands of the oil and gas industry are smaller than they were recently, and, except for seamless pipe and line pipe, orders from that source have not been as large as usual at any time this year.

Of interest in connection with speculation as to the continuance of present steel works operations, is the way scrap dealers are combing the field for ideas upon which to plot their course. As much as \$18 has been paid by consumers for heavy melting steel scrap; there is no admission that more has been paid, but at one point, at least, in this district a dealer is bidding \$18.25 for that grade. Higher prices are predicted in the event that

steel ingot production holds at its present gait for another 30 days. Makers of pig iron also expect to get higher prices on the same premise, it being figured that there will be purchases of scrap by all steel makers if the demand for finished steel holds up and of pig iron by some ordinarily self-contained units.

Close observers of market conditions, however, are looking for some letdown before another month passes, and it is interesting in that connection that a steel company which recently considered putting on another blast furnace finally decided against doing so.

Steel prices are holding steadily. On new business a tendency to seek what is regarded as the top of the market is rather common. Several mills want 2c., base, on new business in bars. Some makers of cold-rolled strips ask 2.85c., base Pittsburgh, on fresh business. The market under present conditions, with makers well supplied with tonnage and consumers well protected on probable requirements, is free from either pressure for business on the part of producers or pressure on prices by consumers.

Pig Iron.—The market still is firm, but, so far as open transactions go, it is very quiet. Private negotiations are understood to be in progress for a considerable tonnage of basic iron, most of which is for delivery in the first quarter of 1929. The American Steel Foundries is in the market for 3000 to 5000 tons of this grade for its Alliance, Ohio, works. A sale of 2500 tons of basic is noted at \$17, f.o.b. a Pittsburgh district furnace. Valley furnaces which have basic iron for sale want \$17, furnace, for it. A company which recently had requirements of a pressing character appears to have picked up a sufficient supply to tide it over the emergency. Foundry iron is moving well on old orders, but new business does not amount to much. An effort to stiffen the price of this grade 50c. a ton to \$17.50, Valley furnace, has not made much progress. A few moderate-sized lots of Bessemer and malleable iron are being sold. The Valley producer of low phosphorus iron has gone to \$27, furnace, for that grade. Otherwise, Valley prices are unchanged.

Prices per gross ton, f.o.b. Valley furnace:

Basic	\$17.00
Bessemer	17.50
Gray forge	16.50
No. 2 foundry	17.00
No. 3 foundry	16.50
Malleable	17.50
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Fluorspar.—It is reported that some makers have advanced their prices to \$18, f.o.b. mines, for gravel spar analyzing 85 per cent calcium fluoride and not over 5 per cent silica. The most recent sale in this district was of 500 tons at \$17, mines. Consumption has risen in keeping with steel works operations and it is said that accumulations at the mines have been pretty well cleaned up. In the meantime, there has been no increase in production on account of the fact that recent prices have been unprofitable.

Semi-Finished Steel.—The market has settled to a basis of \$36, Pittsburgh or Youngstown, for sheet bars and base billets and slabs, with an extra of \$1 a ton for billets and slabs

less than 4 x 4 in. in area. Most non-integrated sheet, tin plate and strip makers have signed fourth quarter contracts at these prices, which, in the case of billets and slabs, are \$1 a ton less than makers set out to obtain. Finishing mills, for the most part, are working on steel bought at third quarter prices. Wire rods are firm at \$42, base Pittsburgh and Cleveland, and are moving steadily.

Bars, Plates and Shapes.—Makers generally find the past week to have been productive of smaller entries on their books than the first week of the month, but the first week included a good deal of third quarter tonnage, specifications for which did not reach mills until after the end of that quarter. Business still is regarded as good, considering the flood of orders and specifications during the latter part of last month, and all mills are booked to the end of the month and some beyond, notably on bars. The market is very firm, and makers are inclined to view 1.90c., base, at which large consumers were covered for this quarter, a matter of history; they are quoting \$1 to \$2 a ton more on current inquiries.

Rails and Track Supplies.—The Carnegie Steel Co. has been awarded 40,000 tons of the 76,000 tons of standard-section rails placed by the Erie and Reading railroads. Distribution of the Pennsylvania and New York Central rail requirements is expected shortly. Some good-sized orders for track accessories are in the offing, but current orders are light. Prices are unchanged.

Wire Products.—Business is fairly good on the whole, but provides no tax on productive capacity. The chief satisfaction of manufacturers is that prices are holding well.

Tubular Goods.—A gas line of 240 miles of 18-in. or 20-in. pipe to run from southern California to San Francisco is the most promising piece of business in this class now before makers. Old orders are slowly playing out. Business still is fairly active in seamless oil country pipe, but only moderately good in butt welded and lap welded pipe. Highest rate of en-

gagement among pipe mills is in seamless pipe-making capacity. In tubing, the best demand still comes from motor car builders.

Sheets.—Business on makers' books still is sufficient to sustain almost full mill operations. There are relatively few idle mills. At several plants of the American Sheet & Tin Plate Co. an extra turn each week is found necessary to make the shipments that consumers are demanding. The common finishes of sheets are firm at the prices asked for this quarter, but some buyers are said to have quotations lower than 3.50c., base, on galvanized sheets. Mills appear to be holding rigidly to the lower cash discount for cash, which became effective Oct. 1.

Tin Plate.—Demand for tin plate for packers' cans has been satisfied for this season, and mill operations are chiefly sustained by general line tin plate requirements and a fair amount of export business. There has been no rolling against early 1929 packers' can requirements. Prices for the first half of next year will probably be announced in the next 30 days, and with that announcement is expected some word as to the cash discount. It is believed that it will be cut from 2 per cent to one half of 1 per cent, effective from Jan. 1.

Cold-Finished Steel Bars and Shafting.—Reports of some letdown in the productive activities of the motor car industry are not reflected in the shipments of cold-finished steel bars, but specifications for material to be used in cars to be built in late November and early December are in lessened volume. Current shipments, for the most part, carry the third quarter contract price. On fourth quarter contracts, 2.20c., base, has been well established.

Hot-Rolled Flats.—Makers in this district still are being pressed for deliveries on orders for strips, and a full operation of mill capacity is necessary to accommodate the demand. Local producers have done nothing yet in connection with the new card of extras.

Chromium Nickel Vanadium	1.50	4.25
Carbon Vanadium	0.95	3.70

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 down to and including 2½ in. squares, the price is \$5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a \$5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

Rails

Per Gross Ton

Standard, f.o.b. mill.....	\$43.00
Light (from billets), f.o.b. mill.....	36.00

On carloads the above discounts on steel pipe are increased on black by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Cold-Rolled Strips.—Recession in automobile production finds no reflection in the insistence of consumers for shipments on their orders. Prices are firm, and, while much tonnage is on makers' books at 2.75c., base Pittsburgh, there is a disposition to quote 2.85c. on new inquiries.

Coke and Coal.—Spot furnace coke is 10c. to 15c. a ton higher as a result of numerous small purchases by furnaces which require supplies in addition to those coming to them on contracts. Lately, it has not been necessary for producers to go under \$2.85 per net ton at ovens to make sales, and some business has been done at a higher price. Spot foundry coke is in good demand and slightly firmer. Warm weather for the time of year has reduced the demand for coal slightly; most of the demand is for prepared sizes for Lake shipment or household use and the supply of

slack, consequently, is so heavy that accumulations are avoided only by sales at very low prices.

Old Material.—The situation in the steel works grades is one of marked firmness. Steel works operations remain high and that means a heavy consumption of scrap and much pressure upon the dealers to deliver on contracts. Mills have gone as high as \$18 for heavy melting steel, and dealers are finding it difficult to pick up tonnages to apply on orders at less than \$17.50. A very strong market in compressed sheets and the railroad specialties exists, partly in sympathy with heavy melting grade. Demand for the specialties is good from the steel foundries.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
Heavy melting steel	\$17.50 to \$18.00
Scrap rails	17.00 to 17.50
Compressed sheet steel	17.00 to 17.50
Bundled sheets, sides and	
ends	15.50 to 16.00
Cast iron carwheels	15.25 to 15.75
Sheet bar crops, ordinary ..	17.50 to 18.00
Heavy breakable cast	13.50 to 14.00
No. 2 railroad wrought	17.50 to 18.00
Heavy steel axle turnings ..	15.00 to 15.50
Machine shop turnings	11.00 to 11.50
Acid Open-Hearth Grades:	
Railr. knuckles and couplers ..	18.50 to 19.00
Railr. coil and leaf springs ..	18.50 to 19.00
Rolled steel wheels	18.50 to 19.00
Low phos. billet and bloom	
ends	20.00 to 20.50
Low phos., mill plates	18.50 to 19.00

Hvy. steel axle turnings	15.00 to 15.50
Electric Furnace Grades:	
Low phos. punchings	18.50 to 19.00
Hvy. steel axle turnings	15.00 to 15.50
Blast Furnace Grades:	
Short shoveling steel turn-	
ings	12.50 to 12.75
Short mixed borings and	
turnings	12.50 to 12.75
Cast iron borings	12.50 to 12.75
No. 2 busheling	11.25 to 11.75
Rolling Mill Grades:	
Steel car axles	19.00 to 20.00
No. 1 railroad wrought	13.00 to 13.50
Sheet bar crops	18.00 to 18.50
Cupola Grades:	
No. 1 cast	15.50 to 16.00
Rails 3 ft. and under	18.00 to 18.50

Warehouse Business.—Black and galvanized sheets are quoted higher out of local warehouses. In a large measure, this change is a reflection of the reduction in the cash discount by the mills. Higher mill prices on bars, plates and shapes have not disturbed regular warehouse prices, which were subject to some shading when mill prices were lower. Warehouse business is reported fairly active.

Japan to Get Iron Ore From Australia

WASHINGTON, Oct. 16.—Recently an agreement was entered into by a Japanese organization with a West Australian syndicate for the purchase of iron ore from Yampi Sound, Western Australia, says a report received by the Department of Commerce from Trade Commissioner E. C. Squire, Sydney. Investigations, it is stated, have proved that there are rich deposits of iron ore of good commercial value at Yampi Sound and that they will be developed by a West Australian syndicate, which has obtained British finance. Experts have been sent out to Western Australia by the Asana group of industrial concerns in Japan, and it is added that this organization will enter into a contract to take 150,000 tons of iron ore the first year, 300,000 tons the second year and from 500,000 to 1,000,000 tons thereafter, according to the output. It is understood that the agreement is for 12½ years. The Asana group, it is reported, will spend \$10,000,000 in Japan to enable it to treat the Yampi ore.

The Aetna-Standard Engineering Co., Youngstown, has moved to new and larger quarters in the Home Savings & Loan Building, Phelps Street, Youngstown, in which it occupies two full floors. Offices are on the ninth floor and the drafting rooms on the eighth floor.

STEAM piping no less than 7 ft. in diameter has been made at the South Philadelphia works of the Westinghouse Electric & Mfg. Co. It is composed of sections of rolled steel ¾ in. thick which were joined by arc-welding. It is to be installed in a large steam turbine generator unit in an Eastern power plant and is designed to carry 1,600,000 lb. of steam per hr. at 40 lb. absolute pressure.

Chicago

Specifications Lighter, Partly Because of Lessened Needs of Automotive Industry—Ingot Output at 85 Per Cent

CHICAGO, Oct. 16.—Specifications for finished steel products, though still holding at the current rate of shipments and assuring ingot output at a shade better than 85 per cent of capacity, are measurably lighter than a week ago. The downturn in demand is partly due to the slackening pace of the automotive industry. Frame makers have passed the peak of fall production and other parts makers have slowed down in like proportion. Sales, not counting rails, are in fair volume following several weeks of heavy forward buying. Most current purchases are for nearby requirements.

Chicago mills will roll 25,000 tons of standard-section rails for the Santa Fe and they expect to book about 30 per cent of the 190,000 tons to be bought by the New York Central. Recent rail contracts, based on 1929 requirements, have not been scheduled at the mills, but output remains unusually high for this time of the year, being supported by the remainder of old obligations and rather liberal miscellaneous new business for nearby delivery.

Railroad contracting for finished steel is moving forward steadily, one Western road having placed 12,000 to 15,000 tons for shipment in this quarter. The Southern Pacific has ordered 25 dining cars. The Great Northern has purchased 500 underframes and the Chicago & Northwestern and the Texas & Pacific will buy caboose car underframes.

With forward contracting well out of the way, Chicago producers are turning their attention to obtaining higher prices for plates, shapes and bars. One seller has named 2.10c. per lb. as the price on current business. Others are recognizing a spread of 2c. to 2.10c., depending on the size and character of orders.

Pig Iron.—Prices for Northern iron are firm at \$18.50 a ton. All furnaces in the immediate Chicago territory are lighted and shipments still overbalance output. Deliveries to foundries that cater to the automobile trade are lighter, but malleable producers appear to be little affected by the changed pace of motor car builders. A few large first quarter sales have been made. Sellers are showing more interest in soliciting 1929 business. Prices for silvery are stronger than in many months, and sales are being made subject to confirmation at the furnaces. The Southern iron market is quiet. Scattered lots of charcoal iron have been purchased at \$24 a ton, furnace.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25..	\$18.50
N'th'n No. 1 fdy., sil. 2.25 to 2.75..	19.00
Malleable, not over 2.25 sil.	18.50
High phosphorus.....	18.50
Lake Super. charcoal, sil. 1.50.....	27.04
So'th'n No. 2 fdy. (all rail).....	22.26
Low phos., sil. 1 to 2, copper free	\$28.50 to 29.00
Silvery, sil. 8 per cent.....	29.79
Bess. ferrosilicon, 14-15%.....	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Plates.—An inquiry for 7000 tons of plates for oil tank construction in the Southwest is before local mills. The railroad equipment market is quiet except for an order for 500 un-

derframes placed by the Great Northern. Current purchases of plates and releases against contracts are keeping local plate mills engaged at about 85 per cent of capacity. Prices, depending on tonnage, range from 2c. to 2.10c. Chicago.

Mill prices on plates, per lb.: 2c. to 2.10c. base Chicago.

Ferroalloys.—In specifications, this market remains active. Spiegeleisen in the 19 to 21 per cent grade has reached a firm basis at \$33 a ton, Hazard, Pa. Inquiry for ferromanganese is quiet, but quotations are steady at \$105, seaboard.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$87.50; spiegel-eisen, 19 to 21 per cent, \$40.76.

Structural Material.—Structural projects are marking time and shop backlogs are growing lighter. Bids were submitted Oct. 15 on 1500 tons for the Rock Island, Ill., plant of the International Harvester Co. Several Western railroads have closed for their fourth quarter requirements of plates, shapes and bars. From all indications, most local fabricators will continue buying only for specific jobs, though several shops have closed small contracts for miscellaneous steel needed for orders expected in the coming months. Prevailing prices are 2c. to 2.10c., Chicago, depending on the tonnage.

Mill prices on plain material, per lb.: 2c. to 2.10c. base, Chicago.

Bars.—Current specifications for soft steel bars are lighter, but mill order books are well filled and mills continue at a high rate of output. Deliveries range from four to six weeks. Automobile parts plants are slowing down. Manufacturers of farm implements, especially tractors, are looking forward with a great deal of confidence and are taking steel at an unchanged rate. Shipments in 1928 from local steel mills to this class of users are the largest in history. It is again heard here that Ford will manufacture tractors. Prices for soft steel bars are steady at 2c. to 2.10c. per lb., Chicago. Mills are taking a firm stand for 2.10c. on all miscellaneous busi-

ness, while 2c. will rule on large tonnages. The iron bar market is without feature. Output of alloy steel bars has dropped to 80 per cent, following lighter releases by the automobile trade. Nail orders are characterized by diversity rather than by size. Prices are steady. Deliveries of rail steel bars are not better on the average than four weeks. Releases against contracts are heavy and spot purchases are in fair volume. Prices are firm at 1.95c. per lb., Chicago Heights. The fence post business is far below producers' expectations.

Mill prices per lb.: Soft steel bars, 2c. to 2.10c., base, Chicago; common bar iron, 2c. to 2.10c., base, Chicago; rail steel bars, 1.95c., base, Chicago Heights mill.

Rails and Track Supplies.—Of foremost interest are the purchase of 115,000 tons of standard-section rails by the Santa Fe and the inquiry of the New York Central for 190,000 tons. About 90,000 tons of the Santa Fe order went to the Colorado mill and 25,000 tons was divided between the Inland Steel Co. and the Illinois Steel Co. Nearly 30,000 tons of track accessories will be needed by the Santa Fe for laying these rails. The Erie purchase, mentioned a week ago, was distributed as follows: 24,471 tons to the Carnegie Steel Co., 11,151 tons to the Illinois Steel Co., 7500 to the Bethlehem Steel Co., and 3500 tons to the Inland Steel Co. Of 13,000 tons of track supplies ordered by the Chesapeake & Ohio, about 3000 tons will be made by Chicago mills. Miscellaneous orders of accessories in the week total 3000 tons. Several users have ordered small tonnages of light rails. Rail mill output remains steady on releases against 1927-28 contracts and small current purchases. The iron tie plate market is quiet, and prices are steady at \$43 a ton.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Cast Iron Pipe.—Interest is revived in this market by several sizable inquiries by local contractors for pipe that is to be laid before winter weather comes. James B. Clow & Sons are low bidders on 200 tons of 3-in. to 24-in. fittings for Chicago. Milwaukee closed bids Oct. 16 on 100 tons of 8-in. Class C pipe. Prices have been advanced to \$35 to \$37 a ton, Birmingham, for diameters 6 in. and larger.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, \$43.20 to \$45.20; 4-in., \$47.20 to \$49.20; Class A and gas pipe, \$4 extra.

Reinforcing Bars.—Activity in this market centers more around bidding and estimating fresh projects than in signing contracts. There is a noticeable pickup in construction of apartments of moderate size, also greater activity among promoters of apartment hotels. The Powhatan Hotel, requiring 500 tons, is up for figures. Among industrial projects of note is

1200 tons for a plant addition for the Western Electric Co. Incoming business is in smaller tonnage than shipments, with the result that shop backlogs are smaller and the current rate of output is assured for only three or four weeks. Competition is keen; prices, regardless of size or kind of bar used, are unsteady. Higher asking prices by mills have had no effect in strengthening reinforcing bar quotations. New contracts and fresh inquiry are given on page 994.

Bolts, Nuts and Rivets.—Lighter requirements by automobile manufacturers are being felt by producers of bolts, nuts and rivets. Output is in excess of shipments and the margin is being put in stock. Prices are firm on all products excepting large rivets.

Billets.—This market is quiet. Prices for rerolling billets, 4 in. and larger, are steady at \$33 a ton.

Wire Rods.—Shipments are in fair volume, and spot business at \$43 per ton is moderately active.

Cold-Rolled Strip.—Some producers of this commodity are considering an early advance of \$2 a ton. Order books are the largest in over three years, and shipments, with mills operating practically at capacity, are gradually becoming more deferred. Chicago delivered prices range from 3.05c. to 3.15c. per lb. The advance talked of would bring the upper limit of the range to 3.25c. The freight rate from Cleveland to Chicago is 30c. per 100 lb.

Sheets.—A realignment has taken place in sheet prices. Chicago delivered quotations on blue annealed have definitely settled to 2.15c. per lb. Black sheets are being sold at 2.90c., while galvanized sheets bring 3.65c. Contracting for fourth quarter is near an end. Following several weeks in which specifications were heavy, there is now less interest in releases, but deliveries have not improved beyond three to five weeks. Third quarter

contracts have been specified in full, but hot mills have not yet completed these orders. Makers of light tanks are less busy, but sheet users in the stove and barrel industries are operating at a high rate. An improvement is noted in shipments to jobbers. Agricultural machinery manufacturers continue to take large quantities.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.90c.; No. 24 galv., 3.65c.; No. 10 blue ann'l'd, 2.15c. Deliv'd prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Wire Products.—Demand from practically all sources is lighter, but producers are holding to a 65 per cent rate of output, with the result that stocks are slowly accumulating at mills. Specifications from the automobile trade are fewer, but still average fully 40 per cent heavier than at this time a year ago. Many consumers are buying at close range and pressing for deliveries. Buyers who are obligated for the final quarter have well-arranged shipping schedules, so that with lighter specifications there is not a great change in the rate of deliveries. The jobbing trade continues to lag; most sellers, taking into account the lateness of the season, have little hope that conditions in this trade will be bettered this fall. Orders from the South are consistent but not large, but heavier shipments are being made to the Northwest. Demand for nails is running behind that of the early fall months of 1927.

Old Material.—Prices for most grades of scrap are strong and consumers' interest remains high. Consumption is heavy and pressure for delivery is severe. In specialties, spot cars are eagerly sought and car tracing is giving considerable trouble to dealers. For the most part, consumers still resist prices by making purchases in small lots for immediate use. Producers of scrap are being pressed to make shipments, with the result that the average carload is lighter than at the turn of the month. Supplies available at car shops are small and sales by automobile car manufacturers are measurably lighter. Cars coming on track from railroads are fewer in number. These factors are believed by some to be indicators of a sustained market over the next four to six weeks. However, higher prices at points of consumption are inducing country dealers to release stocks. Several weeks ago this market was tight on short rails, but shipments from as far as St. Paul have relieved the situation. It is evident, too, that local yard dealers are willing at present price levels to liquidate holdings gathered when prices were low. There is little reason to doubt that the supply is still in excess of demand, but the margin is close and the variation from week to week makes the market difficult to gage. In many instances dealers are being forced to pay prices equal to the figures written in contracts. The Santa Fe has obtained

\$14.90 a gross ton, delivered, on 1000 tons of heavy melting steel. Direct bidding on railroad lists by consumers is more common.

*Prices deliv'd Chicago district consumers:
Per Gross Ton*

Basic Open-Hearth Grades:
Heavy melting steel.....\$14.00 to \$14.50
Shoveling steel 14.00 to 14.50
Frogs, switches and guards,
cut apart, and misc. rails 15.50 to 16.00
Hydral. compressed sheets 12.25 to 12.75
Drop forge flashings..... 9.50 to 10.00
Forg'd, cast and r'l'd steel
carwheels 17.25 to 17.75
Rail'r'd tires, charg. box
size 17.25 to 17.75
Rail'r'd leaf spring cut
apart 17.25 to 17.75

Acid Open-Hearth Grades:
Steel couplers and knuckles 15.75 to 16.25
Coil springs..... 18.25 to 18.75

Electric Furnace Grades:
Axle turnings..... 13.50 to 14.00
Low phos. punchings..... 15.50 to 16.00
Low phos. plate, 12 in.
and under..... 15.50 to 16.00

Blast Furnace Grades:
Axle turnings..... 11.00 to 11.50
Cast iron borings..... 10.50 to 11.00
Short shoveling turnings.. 10.50 to 11.00
Machine shop turnings.... 6.75 to 7.25

Rolling Mill Grades:
Iron rails..... 14.75 to 15.25
Rerolling rails 16.50 to 17.00

Cupola Grades:
Steel rails less than 3 ft.. 17.25 to 17.75
Angle bars, steel..... 16.50 to 17.00
Cast iron carwheels..... 13.75 to 14.00

Malleable Grades:
Railroad 15.25 to 15.75
Agricultural 12.50 to 13.00

Miscellaneous:
*Relaying rails, 56 to 60 lb. 23.00 to 25.00
*Relaying rails, 65 lb. and
heav. 26.00 to 31.00

Per Net Ton

Rolling Mill Grades:
Iron angles and splice bars 14.50 to 15.00
Iron arch bars and trans-
oms 20.50 to 21.00
Iron car axles..... 25.50 to 26.00
Steel car axles..... 16.25 to 16.75
No. 1 railroad wrought... 12.75 to 13.25
No. 2 railroad wrought... 12.50 to 13.00
No. 1 busheling 11.00 to 11.50
No. 2 busheling 6.00 to 6.50
Locomotive tires, smooth.. 13.00 to 13.50
Pipes and flues..... 9.00 to 9.50

Cupola Grades:
No. 1 machinery cast..... 15.50 to 16.00
No. 1 railroad cast..... 14.50 to 15.00
No. 1 agricultural cast.... 13.75 to 14.25
Stove plate 11.50 to 12.00
Grate bars..... 12.25 to 12.75
Brake shoes 11.50 to 12.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Windows built of inflammable material are never a protection against fire is a conclusion reached by the National Fire Protection Association, which recently issued a survey of the Fall River conflagration of Feb. 2. "The failure of wired glass windows because of the use of ordinary frames presents an interesting lesson as to the importance of metal frames for wired glass windows," states the association. The frames must be so designed that the glass will positively remain in place even when the expansion caused by the heat of the fire may have bowed out the glass and seriously distorted the frame."

Philadelphia

Eastern Pennsylvania Mills Operating at High Rate—Basic Pig Iron Sold at an Advance

PHILADELPHIA, Oct. 16.—Operating rates of eastern Pennsylvania mills range from about 85 per cent to 93 per cent. Most steel consumers are covered by contracts for the fourth quarter, so that new buying is limited to small orders. Specifications against contracts, however, are heavy, and plate and sheet mills have four to five weeks' work ahead. Producers of shapes are not in so satisfactory a position as other mills, but have a fair volume of business on their books. A steel company has announced an advance on foundry pig iron to \$20.50 per ton, furnace, and other producers are asking \$20.50 on carload lots. Two small tonnages of basic have been closed at an advance in price from the previous basic sale, and a sizable order is still pending from an eastern Pennsylvania plate mill. Prices of iron and steel scrap are strong, with a slight upward tendency, but new contracts on scrap are in most cases for small tonnages.

Pig Iron.—An eastern Pennsylvania plate producer, which bought 25,000 tons of basic pig iron about 30 days ago, has come into the market again for 20,000 tons. Two smaller users of basic in this district have closed on 2500 to 5000 tons at \$19.75 per ton, delivered, an advance from the previous purchase price. A steel company producer has advanced its quotation to \$20.50 per ton for foundry iron, and this is the usual asking price of other furnaces on the smaller lots. Although sellers are apparently willing to make contracts for first quarter at \$20.50, base, none of the eastern Pennsylvania furnaces is seeking business at this price, and consumers have shown only moderate interest in deliveries beyond the first of the year. Low phosphorus iron is quiet, but prices are firm on both the copper bearing and copper free grades. The Virginia producer of iron has booked an order for 10,000 tons from a Virginia pipe foundry. The Virginia market is firm at \$20, base furnace.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	\$20.76 to \$21.26
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.26 to 21.76
East. Pa. No. 1X.	21.76 to 22.26
Basic (del'd east. Pa.)	19.75
Gray forge.	19.75 to 20.25
Malleable	21.00 to 21.50
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. b'rg low phos. (f.o.b. furnace)	23.00 to 23.50
Va. No. 2 plain, 1.75 to 2.25 sil.	24.54
Va. No. 2X, 2.25 to 2.75 sil.	25.04

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to \$1.64 from eastern Pennsylvania furnaces; \$4.54 from Virginia furnaces.

Ferromanganese.—Domestic producers report a continuance of heavy requisitions for ferromanganese. The price is firm and unchanged at \$105 per ton, seaboard, for both the domestic and foreign product.

Bars.—Mills are booked with business for several weeks, many of the contracts for this quarter being at 1.95c. per lb., Pittsburgh, or 2.27c., Philadelphia. Some large buyers, who have been receiving third quarter deliveries on low-priced contracts, are now under contract at 1.90c., Pittsburgh, or 2.22c., Philadelphia. On miscellaneous new business mills re-

port 2c., Pittsburgh, or 2.32c., Philadelphia, as firm.

Shapes.—Quotations f.o.b. nearest mill to the consumer are becoming quite common with mills in this district, so that, while the market continues firm at 2.05c. per lb., base, quotations are made f.o.b. Pencoyd, Pottsville, Bethlehem and occasionally Phoenixville. Structural mills are not so well off as to tonnage as other steel producers, but report a fair amount of business on their books and a steady flow of specifications against contracts.

Plates.—Operations in this district are at about 90 per cent of capacity. Deliveries are becoming more extended. Shipments are going forward on contracts at 2.05c., Coatesville, or 2.15c., Philadelphia. On new business, 2.10c., Coatesville, or 2.20c., Philadelphia, is reported still quoted on desirable orders, but on small lots the quotation is 2.15c., Coatesville, or 2.25c., Philadelphia.

Sheets.—Black and galvanized sheets continue firm at 2.75c., Pittsburgh, or 3.07c., Philadelphia, on black and 3.50c., Pittsburgh, or 3.82c., Philadelphia, on galvanized. Blue annealed sheets are firm at 2.10c., base Pittsburgh, on widths greater than 45

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.

†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

in., but on the narrower sheets, continuous mills are still willing to quote 1.90c. to 1.95c., Pittsburgh, so that 2c., base, for blue annealed in these competitive widths is not so firm as the base price on wide sheets. Mills are fully engaged for the next four to six weeks.

Warehouse Business.—Jobbers report a steady flow of orders, particularly in galvanized sheets. Prices and quantity differentials are firmly maintained.

Imports.—In the week ended Oct. 13, iron ore arrivals at this port consisted of 5802 tons from Algeria. Of 1282 tons of manganese ore received, 1250 tons was from British India and 32 tons from Germany. Pig iron receipts were 500 tons from British India. Steel imports consisted of 402 tons of structural shapes and 6 tons of steel bars from Belgium, 506 tons of steel skelp from France and 23 tons of steel scrap from the United Kingdom.

Old Material.—All grades of iron and steel scrap are firm, partly a reflection of the strong market in western Pennsylvania. Recent contracts made by consumers in this district have been small, but at the present level of prices. Machine shop turnings are being bought by a broker-buying agent for a Phoenixville consumer at \$11.50 per ton, and another broker is paying \$12 per ton, delivered in eastern Pennsylvania. Stove plate is firm at \$13 per ton, delivered. Forge fire, bought at \$13 per ton by a consumer at Reading, Pa., is understood to have been of a high quality, for which the buyer was willing to pay a slight premium.

Prices per gross ton delivered consumers' yards, Philadelphia district:

Steel rails for rolling.	15.50 to 16.00

September shipments of electric industrial trucks and tractors are reported by the Department of Commerce at 118 units, of which five were for export. This is the highest total since April, when 136 units were shipped. It compares with 96 in August. A year ago there were only 79.

New York

Steel Prices Stiffen on Current Small Orders—New York Central to Buy 190,000 Tons of Rails

NEW YORK, Oct. 16.—The pig iron market is passing through a lull such as frequently follows a period of active contracting. Sales for the week were made up of relatively small lots and totaled only about 7000 tons. New inquiries are mainly for fill-in tonnages for early delivery, and it is unlikely that demand will again be active until consumers are ready to cover their first quarter requirements. Among current inquiries is one from the General Electric Co. for 1200 tons for its Elmira, N. Y., plant and 500 tons each for its Pittsfield and Lynn, Mass., works. Except for this inquiry and one for 1200 tons for delivery in this district, pending business includes no outstanding tonnages. Sales of foundry iron by New York State and New England furnaces continue at \$17, base Buffalo, or the equivalent. Pressure for shipments is unabated, and there is every indication that foundry melt is holding its own, if not gaining.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil.	1.75 to 2.25	\$21.91
*Buf. No. 2, del'd east.		20.28
N. J.		
No. 2, del'd east. N. J.		
tidewater	\$20.01 to	21.25
East. Pa. No. 2 fdy., sil.	1.75 to 2.25	20.89 to 22.02
East. Pa. No. 2X fdy., sil.	2.25 to 2.75	21.39 to 22.52
East. Pa. No. 1X fdy., sil.	2.75 to 3.25	21.89 to 23.02

Freight rates: \$4.91 from Buffalo, \$1.39 to \$2.52 from eastern Pennsylvania.
*Price delivered to New Jersey cities having rate of \$3.28 a ton from Buffalo.

Plates, Shapes and Bars.—Following the large orders and specifications for the heavy tonnage products in the latter part of September and the first week of October, there has been a decided letdown in the past week. This is not a surprising development, as consumers are covered for a month or longer, and it is not to be expected that orders in volume will be forthcoming until present commitments are nearing exhaustion. Mill representatives are in a happy frame of mind, not only because of the relatively full engagement of the mills, but because of the minimum of opposition among buyers to the higher prices now being asked. Some consumers, whose buying habits have tended toward last-minute ordering with requests for prompt shipment, now find that they must await mill convenience. Small orders for urgent needs are in most cases taking the top prices. Large buyers have been covered at 2.22½c., New York for plate; 2.19½c., New York, for shapes, and 1.90c., Pittsburgh, for bars, but these prices are now being rarely quoted, and current sales are more frequently at \$1 or \$2 a ton higher. A promise of quick delivery is more potent in getting some orders than price. Mill operations in the East are at a high rate. The

Bethlehem Steel Co. is running its plants at about 90 per cent, and Eastern plate mills have the best operation in many months. In addition to 3000 tons of reinforcing bars, a warehouse to be built in New Jersey for the Delaware, Lackawanna & Western

Railroad will take 1000 to 3000 tons of sheet steel piling. The New York Central Railroad has issued its annual inquiry for rails, calling for 190,000 tons.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.24c. to 2.34c.; plates, 2.22½c. to 2.32½c.; struc. shapes, 2.19½c. to 2.22½c.; bar iron, 2.14c.

Warehouse Business.—October has been a better month for business than September, and some jobbers expect it will be the best month of the year. Demand for structural material continues good. Individual orders are increasing in tonnage. Black and galvanized sheet prices are firmer than for some time. Galvanized sheet orders are numerous.

Coke.—More ovens are being lighted in the Connellsville district, but prices of the standard furnace grade are stronger, ranging from \$2.95 to \$3.05 per ton, Connellsville. Some of this firmness is reflected in the market on foundry coke, which ranges from \$3.50 to \$3.75 per net ton, Connellsville. Standard brands are unchanged at \$4.85 per net ton, ovens, or \$8.56 per net ton delivered to northern New Jersey, Jersey City and Newark and \$9.44 per ton to New York and Brooklyn. By-product foundry coke prices are \$9 to \$9.40, Newark or Jersey City, and \$10.06, New York or Brooklyn.

Cast Iron Pipe.—Southern makers are quoting prices considerably higher than the bids of Northern foundries. On a recent opening in the New York territory, tenders are reported to have been on a basis of \$32.50 per net ton, f.o.b. Florence, N. J., and \$33 per ton, f.o.b. Burlington, N. J. Among current inquiries is one for 14,000 tons of 6 to 30-in. water pipe for Warwick, R. I. Herkimer, N. Y., is taking bids on 1300 tons of water pipe.

Prices per net ton, deliv'd New York: Water pipe, 6-in. and larger, \$35.60 to \$36.60; 4-in. and 5-in., \$40.60 to \$41.60; 3-in., \$50.60 to \$51.60; Class A and gas pipe, \$4 to \$5 extra.

Sheets.—Many sheet buyers who did not cover their fourth quarter requirements in full, now confronted with a mill situation which makes early deliveries almost impossible, are placing orders for shipment at mill convenience, which generally means four to six weeks. Prices are firm on all grades. The week's purchases have disclosed little or no objection to 2.75c., Pittsburgh, on black, 3.50c. on galvanized and 2c. on blue annealed narrower than 45 in.

Reinforcing Bars.—Several fair-sized jobs have been placed in the last week at the new scale of prices, and the market seems to be quite firm. Interest is centered in the terminal warehouse for the Delaware, Lackawanna & Western Railroad at Jersey City, which will require about 3000 tons of bars, and in the water tunnel for the New York Board of Water Supply, calling for 2850 tons. Both of these jobs will likely be placed soon. The Pittsburgh mill price for 40, 50 and 60-ft. lengths is 2c. per lb., and out of Pittsburgh mill warehouse

distributers are quoting 2.25c., or 2.59c., on cars at New York. New York warehouse prices are unchanged, ranging from 2.80c. to 3.24c. per lb., all delivered at job.

Old Material.—Although no further purchases of No. 1 heavy melting steel are reported by eastern Pennsylvania mills, brokers are paying as much as \$15.75 per ton, delivered to Claymont, Del., and Coatesville, Pa., and \$15 per ton is quoted for delivery to Bethlehem, Pa. Some brokers are offering \$12.50 per ton, New York, for No. 1 heavy melting steel for shipment to western Pennsylvania. Machine shop turnings are being purchased at \$11.50 and \$11.75 per ton, delivered Phoenixville, Pa., and at \$12 per ton, delivered Conshohocken, Pa. Other grades of scrap are substantially unchanged, but the undertone of strength continues.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel.	\$12.00 to \$12.50
Heavy melting steel (yard)	8.75 to 9.50
No. 1 hvy. breakable cast.	12.75 to 13.50
Stove plate (steel works)	8.75 to 9.00
Locomotive grate bars	9.25 to 10.25
Machine shop turnings	8.00 to 8.50
Short shoveling turnings	8.00 to 8.50
Cast borings (blast furn. or steel works)	6.50 to 7.50
Mixed borings and turnings	6.75 to 7.25
Steel car axles	18.00 to 18.50
Iron car axles	25.25 to 26.25
Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.75
Forge fire	8.50 to 9.00
No. 1 railroad wrought	11.75 to 12.25
No. 1 yard wrot., long	10.75 to 11.25
Rails for rolling	11.50 to 12.00
Cast iron carwheels	13.00 to 13.50
Stove plate (foundry)	9.50 to 10.00
Malleable cast (railroad)	10.00 to 10.50
Cast borings (chemical)	11.25

Prices per gross ton, deliv'd local foundries:

No. 1 machy. cast	\$17.00 to \$18.00
No. 1 hvy. cast (columns, bldg. materials, etc.) cupola size	15.00 to 16.00
No. 2 cast (radiators, cast boilers, etc.)	14.50 to 15.50

British Steel Output Gains in September

LONDON, ENGLAND, Oct. 15 (*By Cable*).—Pig iron output in September was 503,900 gross tons, and production of steel ingots and castings was 718,600 tons.

A comparison of the September output with that of the eight preceding months of the year, and with the monthly rate for previous years is as follows, in gross tons:

	Pig Iron, Tons	Steel Ingots and Castings, Tons
1913—Av. monthly	855,000	638,600
1920—Av. monthly	669,500	755,600
1922—Av. monthly	408,500	490,100
1923—Av. monthly	620,000	706,800
1924—Av. monthly	609,900	685,100
1925—Av. monthly	519,700	616,400
1926—Av. monthly	203,500	296,700
1927—Av. monthly	607,800	758,200
1928—January	560,600	626,200
1928—February	550,800	764,400
1928—March	592,600	793,300
1928—April	555,000	644,100
1928—May	591,500	752,700
1928—June	563,700	709,500
1928—July	537,800	666,900
1928—August	519,000	648,300
1928—September	503,900	718,600

The September pig iron output was the smallest thus far this year, while steel production was the fourth largest.

Cleveland

Bookings of Finished Steel Fall Off But Volume is Still Good, Particularly From Automotive Industry

CLEVELAND, Oct. 16.—While bookings of finished steel continued good the past week, the volume with some mills was not as heavy as during the first week of the month. Steel bars are in very good demand, particularly from the automotive industry, and structural shapes are moving well. Plates are lagging somewhat, not being as active as a few weeks ago. Most orders are small and consumers want quick delivery. Many consumers of the heavy rolled products have made fourth quarter contracts.

No marked decrease in the demand for steel from the automotive industry is noticeable, but a falling off in orders is expected during the remainder of the month, as some of the automobile manufacturers will shut down for inventories for two or three weeks about Nov. 1. Their output, on resuming operations, doubtless will depend on the demand for motor cars at that time. The Chevrolet Motor Car Co., which is completing work on its old models, will start production on its new models next month, and its new demands for steel will at least partly offset a slowing down in orders from other automobile plants.

The automotive industry is looking ahead to 1929 and predicting that this year's record in output of cars will be broken next year.

Structural inquiry is fairly plentiful, particularly for small lots, and the smaller fabricators are said to be busier than they have been for some time. A dam over the Mississippi River at Hastings, Neb., will require 3000 tons of steel, mostly in reinforcing bars and piling.

Prices are well maintained at 1.95c., Pittsburgh, for steel bars, plates and structural material on the bulk of current business. Outside bar mills, using a Cleveland base, quote steel bars at 1.95c. to 2.05c., Cleveland, while Cleveland mills generally quote 1.90c., Cleveland.

Pig Iron.—The demand for iron in shipments on contracts continues heavy. Stock piles of some furnaces have been almost wiped out and producers are not as prompt as they were in making deliveries. Shipments by some furnaces so far this month have exceeded those during the same period in September. The automotive industry is taking iron at the recent volume, and there has been an increase in shipping orders from other consumers. The market is still fairly active. First quarter inquiry so far has been rather moderate, and, while some of the Lake furnaces have made sales of foundry and malleable iron for that delivery, furnaces located in Cleveland have not yet opened their books. One Lake furnace interest, which took some first quarter business in western

Ohio at \$18, has advanced its price 50c. a ton to \$18.50 for that territory and for Indiana shipment. For delivery in central Ohio, where there is more competition, \$18 is being quoted for the first quarter. However, the first quarter price situation will not be definitely cleared up in some sections until Cleveland and Valley furnaces open their books for that delivery. For Michigan delivery, the first quarter price is well established on several sales at \$18.50, which has been the ruling quotation for a few weeks. A Muncie, Ind., consumer which inquired for 6000 tons of malleable iron for the first quarter, has postponed buying. The Valley foundry iron market shows a firmer tone, with sizable sales at \$17.50. Cleveland interests sold 26,000 tons during the week, about one-third of which was for the first quarter. Inquiry for low phosphorus iron has become more active. While one 200-ton lot brought \$27, a 50c. a ton lower price has not disappeared.

Prices per gross ton, at Cleveland:

N'th'n fdy., sil.	1.75 to 2.25	\$18.50
S'th'n fdy., sil.	1.75 to 2.25	22.25
Malleable		18.50
Ohio silvery, 8 per cent.		28.00
Basic Valley furnace		17.00
Stand. low phos., V'ley fur.	\$26.50 to	27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Iron Ore.—A few small-lot sales are still being made for fill-in purposes. The dock balance at Lake Erie ports Oct. 1 was 6,100,456 tons, compared with 6,768,735 tons on the same date a year ago. Receipts at Lake Erie ports during September were 5,826,530 tons and for the season 27,341,510 tons, compared with 29,792,366 tons during the same period last year. Shipments from Lake Erie ports during September were 3,884,346 tons and for the season 19,480,038 tons, compared with 21,556,077 tons during the same period last year. Shipments to other than Lake Erie ports show a gain compared with last year. These, including shipments to interior furnaces from South Chicago, were 12,320,763 tons, against 11,304,643 tons during the same period last year.

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and struct. shapes	3.00c.
Soft steel bars	3.00c.
Reinforc. steel bars	2.25c. to 2.50c.
Cold-fin. rounds and hex.	3.65c.
Cold-fin. flats and sq.	4.15c.
Hoops and bands	3.65c.
Cold-finished strip	5.95c.
Black sheets (No. 24)	3.50c.
Galvanized sheets (No. 24)	4.25c.
Blue ann'l'd sheets (No. 10)	3.35c.
No. 9 ann'l'd wire, per 100 lb.	\$2.85
No. 9 gal. wire, per 100 lb.	3.30
Com. wire nails, base per keg	2.85

*Net base, including boxing and cutting to length.

Strip Steel.—Mills are still getting a good volume of orders against contracts for hot-rolled strip, but there is very little new business. While several producers have announced that they will adopt the new card of extras, some have not yet got out their printed cards and it will take some time for consumers to familiarize themselves with the price changes. These will not become generally effective until the first quarter, as larger consumers are covered for the remainder of the year. Cold-rolled strip is fairly active. The market is firm at 2.75c., Cleveland, for good lots, some small-lot business being taken at 2.85c.

Semi-Finished Steel.—A Cleveland mill has taken a large volume of business for the fourth quarter at \$33, Cleveland, Youngstown and Pittsburgh, for sheet bars, large billets and slabs, with a \$1 a ton higher price for under 4-in. billets. There is already talk of higher prices for the first quarter. Forging billets range from \$38 to \$39, Ohio mill. Specifications for sheet bars, billets and slabs are heavy.

Sheets.—Orders are still plentiful, apparently equal to production, so that there is no change in the delivery situation. Few mills can make shipments within four weeks, and deliveries are further extended on automobile body sheets. These and black sheets in the common finishes are in better demand than other grades. Most of the mills are holding firmly to regular prices and are meeting little price resistance. However, on attractive business a few cases of price shading of from \$1 to \$2 a ton are reported on black sheets, and a buyer of 1300 tons of blue annealed sheets was able to obtain a concession. An inquiry for 400 tons of galvanized sheets failed to reveal weakness on that grade. Cleveland stamping plants have taken orders for running boards for the new models of Chevrolet cars, which it is estimated will require 5000 tons of sheets for a three months' production. These sheets have not yet been purchased.

Reinforcing Bars.—While several fair-sized jobs are still pending, inquiry for steel for building work has fallen off. However, the demand for steel for road work is very active. Warehouse prices are better maintained than recently, holding rather closely to 2.25c., Pittsburgh.

Warehouse Business.—Sales show a gain over last month's, doubtless due partly to some slowing down in mill deliveries. Galvanized sheets are quite active. Prices are well maintained.

Coke.—By-product coke for domestic use is fairly active. This is quoted at \$4.50, Valley, for egg size, and \$5, Cleveland, for egg and \$4.85 for nut for outside shipment. The price differential between Valley and Cleveland producers equalizes the freight rate to some important consuming points. For Cleveland delivery, egg

coke is quoted at \$6, delivered. Foundry coke is quiet and unchanged at \$4, Connellsville, for good brands and \$7.75, Painesville, for Ohio by-product coke.

Old Material.—The market continues very firm and prices have advanced further on several grades. Dealers are paying \$14.25 for No. 1 heavy melting steel for delivery to one Cleveland mill and \$15 to \$15.25 for shipment to another, which requires higher grade material. For Youngstown shipment, the price dealers are paying has advanced to \$16.50 for No. 1 heavy melting steel. For compressed sheet steel, they are paying \$16 to \$16.50 for the same delivery. Machine shop turnings and blast furnace scrap have advanced 25c. a ton. On the latter, \$10.50 has become the ruling price, although sales are reported at \$10.75. Mills still appear to be well supplied with scrap, as they are getting shipments at a fair rate and they are showing no interest in new orders.

Prices per gross ton delivered consumers' yards:

Basic-Open-Hearth Grades		
No. 1 heavy melting steel.	\$14.00 to	\$14.50
No. 2 heavy melting steel.	13.25 to	13.50
Compressed sheet steel....	13.50 to	14.00
Light bundled sheet stamp'gs	11.50 to	11.75
Drop forge flashings.....	12.25 to	12.75

Railroad malleable.....	16.00 to	16.50
Rails for rolling.....	16.25 to	16.50

Lower Production of Track Work

Shipments of track work for T-rail track of 60 lb. and heavier are reported for September by the American Iron and Steel Institute at 10,767 net tons. This is the lowest figure since last January. It compares with 11,040 tons in August and with 10,999 tons a year ago. For the third quarter, shipments aggregated 33,583 tons. This is, with one exception, the lowest quarter's shipments in several years. It compares with 41,368 tons in the second quarter of this year, with 37,603 tons in the third quarter of last year, and with 45,997 tons in the third quarter of 1926. Shipments in the first nine months were 110,712 tons, compared with 131,872 tons in the same period last year and 154,663 tons in 1926.

Steel Corporation's Orders Increase in September

Another increase in the unfilled orders of the United States Steel Corporation was recorded in September. The total on Sept. 30 was 3,698,368 tons, compared with 3,624,043 tons on Aug. 31—an increase of 74,325 tons. In August the increase was 53,116 tons, while in July there was a decrease of 66,082 tons. A year ago, on Sept. 30, the unfilled orders were 3,148,113 tons, or 550,255 tons less than this year. The table gives the reported figures for the last 12 months.

		1928	1927
Jan.	31.....	4,275,947	3,800,177
Feb.	28.....	4,398,189	3,597,119
Mar.	31.....	4,335,206	3,553,140
April	30.....	3,872,133	3,456,132
May	31.....	3,416,822	3,050,941
June	30.....	3,637,009	3,053,246
July	31.....	3,570,927	3,142,014
Aug.	31.....	3,624,043	3,196,037
Sept.	30.....	3,698,368	3,148,113
Oct.	31.....		3,341,040
Nov.	30.....		3,454,444
Dec.	31.....		3,972,874

At the end of April, 1917, the highest total in unfilled orders of the Steel Corporation ever attained was reported at 12,183,193 tons. The lowest figure ever reported was 2,754,757 tons, Dec. 31, 1910.

Reduction in Output of Foundry Supplies

Establishments engaged primarily in the manufacture of foundry supplies reported products valued at \$11,635,060 in 1927, a decrease of 8.6 per cent as compared with \$12,723,120 for 1925, the preceding census year, according to the Bureau of the Census, Washington. In addition, foundry supplies are made to some extent by establishments classified in other industries. The value of such products made outside of the industry proper in 1925 was \$1,080,801. The corresponding value for 1927 has not yet been ascertained.

Establishments classified in this industry are those engaged in the manufacture of foundry facings, molding sand, cement for castings, core oils and compounds, chaplets, wax, flux, "parting" composition, flasks, riddles or sieves, pipe blacking and plumbago. Facings and supplies made by foundries for their own use are not, as a rule, reported separately.

Sustained demand for cars and trucks, according to *Automotive Industries*, is continuing factory operations at a rate far in excess of the usual fourth-quarter level and only slightly lower than in the record breaking third-quarter just closed. There are as yet no signs of any extensive stocking of new cars by dealers and several factories are weeks behind in meeting dealer demand. Two important manufacturers' plans for European sales in 1929 indicate greatly increased demand for American cars.

Pacific Coast

Gas Line to Take 50,000 Tons of Pipe—Oil Tanks Call for 2000 Tons of Plates

SAN FRANCISCO, Oct. 13 (*By Air Mail*).—Developments in the Pacific Coast iron and steel markets this week include the award of five additional 134,000 bbl. tanks requiring 2000 tons of plates, by the General Petroleum Corporation, Los Angeles, to McClintic-Marshall Co., and the announcement that a new company has been organized to construct a natural gas pipe line from Ventura to San Francisco. For this project, about 50,000 tons of line pipe will be used.

Building operations on the Pacific Coast are steady. September permits for the five principal cities were as follows: Los Angeles, \$8,505,327; San Francisco, \$2,422,080; Oakland, \$1,777,005; Seattle, \$1,474,210; Portland, \$1,281,216. Permits issued in Los Angeles in September of this year were less than the total for the same month last year.

Pig Iron.—Demand for foundry pig iron has not increased appreciably during the past month. During the past 10 days about 1400 tons of Indian iron arrived on the Coast. The next large shipment is due Nov. 28. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic.....	\$25.00 to \$26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	24.00 to 25.00

*Delivered San Francisco.

**Duty paid, f.o.b. cars San Francisco.

Bars.—The only large award of reinforcing steel bars this week went to the Pacific Coast Steel Co.—575 tons for three buildings at Fort Lewis, Wash., for the United States Army. The largest pending project calls for 1800 tons for the Life Science Building at the University of California at Berkeley. New business includes 675 tons for a warehouse for Sears, Roebuck & Co. in San Francisco, 164 tons for a drainage project at Los Angeles and 129 tons for a highway extension in Orange County, Cal. Out-of-stock prices in Los Angeles and San Francisco continue weak, and 1.80c., base, is general.

Plates.—The General Petroleum Corporation, Los Angeles, has placed five additional 134,000 bbl. storage tanks with the Riter-Conley Co., through the McClintic-Marshall Co. About 2000 tons of plates will be re-

quired. The Shell Oil Co. has taken no action on its inquiry for 10 80,000 bbl. tanks, calling for 3100 tons, for its Domingues plant. Bids were opened this week on 1200 tons for a pipe line at Hood River, Ore. No new inquiries of importance have come up for figures. Prices continue to range from 2.20c. to 2.25c., c.i.f., with a strengthening tendency.

Shapes.—Structural shape awards this week exceeded 5500 tons. Those outstanding were 2500 tons for a tin plate mill for the Columbia Steel Corporation at Pittsburg, Cal., placed with McClintic-Marshall Co., 2000 tons for a power house for the Great Western Power Co., San Francisco, booked by Dyer Brothers, and 170 tons for an apartment at Baywood, Cal., obtained by the Judson-Pacific Co. Bids were opened this week on 243 tons for a bridge over the Yellowstone River at Gardiner, Mont. The Illinois Steel Bridge Co. was low bidder. Pending business exceeds

10,000 tons. Plain material continues firm at 2.35c., c.i.f. Coast ports.

Cast Iron Pipe.—Demand for cast iron pipe has fallen off, though a fair-sized tonnage was placed this week. Los Angeles placed 844 tons of 8-in. Class 350 pipe with R. D. Wood & Co. through Jones-Lyman Co. and 422 tons of the same size with the Pacific States Cast Iron Pipe Co. A number of small street improvement projects in San Diego, Cal., calling for more than 225 tons, were placed this week with various interests. Only two important projects are now up for figures; these are 1284 tons of 24-in. Class B or riveted steel pipe for Seattle and 164 tons of 2 to 12-in. Class B pipe for Phoenix, Ariz.

Steel Pipe.—The Pacific Gas & Electric Co., the Southern California Gas Co. and the Pacific Lighting Co. have announced the formation of the Northern California Gas Co., with capital stock of \$5,000,000, to construct a pipe line of 210 miles from Ventura to San Jose, Cal., to transport natural gas to the bay districts. This project will require about 50,000 tons of 12 to 22-in. pipe. It is understood that the construction of the line will be begun in the near future.

St. Louis

Steel Orders Still Good Despite Recent Heavy Ordering—Pig Iron Firm—Scrap Again Advances

ST. LOUIS, Oct. 16.—Most melters in the St. Louis district are covered on their pig iron requirements for the remainder of the year, with the result that sales, which fell off this week, probably will continue to show recessions until makers open their books for the first quarter of next year. Some inquiry is being made for next quarter iron, but furnaces are not making prices for that shipment. The market is firm, and there is some talk of another advance of at least 50c. a ton. The melt in the district is heavy, and calls for iron are urgent. The stove interests are enjoying an unusually good shipping season, and foundries catering to agricultural lines are doing a heavy business. Mills specializing in railroad material report quiet business. The St. Louis Gas & Coke Corporation sold 3700 tons, including 500 tons to an implement maker, 300 tons each to two stove foundries, 300 tons to a specialty maker, 200 tons to an Illinois implement maker, and the remainder in lots of a carload up to 150 tons.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b.	
Granite City, Ill.	\$19.50 to \$20.00
N'th'n No. 2 fdy., deliv'd St. Louis..	20.16
Southern No. 2 fdy., deliv'd.....	20.67
Northern malleable, deliv'd.....	20.16
Northern basic, deliv'd.....	20.16

Freight rates: 81c. Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Finished Iron and Steel.—The Texas & Pacific Railway, which is in the market for 30,000 tons of rails for its 1929 requirements, and not the Missouri Pacific, as stated in these columns last week, is expected to place the business early next week. None of the railroads centering in St. Louis has indicated its requirements for next year. Steel specifications continue to reach the Granite City Steel Co. in satisfactory volume, despite the fact that during the latter part of September nearly all buyers availed themselves of third quarter contracts then existing, specifying

heavily against them. The demand for all classes of sheets has resulted in a large backlog and extended deliveries. If plate inquiries now pending develop into orders, a very fair tonnage will soon be on mill books. Business with structural fabricators is light.

Old Material.—Prices for old material are higher because dealers, to fill contracts, have been forced to pay more in competition with other territories. In some cases, dealers are filling contracts at losses. Mills are still holding out against the advancing market. Most of them are fairly well supplied with stocks of old material. Heavy melting steel, heavy shoveling steel, railroad springs, No. 2 railroad wrought, No. 1 busheling, cast iron borings, rails for rolling are up 25c. a ton, while iron car axles are 50c. higher, and wrought iron bars and transoms and railroad malleable are \$1 a ton up. Railroad lists include: Louisville & Nashville, 12,500 tons; Chesapeake & Ohio, 7606 tons; Atchison, Topeka & Santa Fe, 6240

tons; Southern, 6710 tons; Pennsylvania, 2136 tons; Frisco, 1000 tons; Texas & Pacific, 595 tons; Kansas City Southern, 435 tons; Nickel Plate, 39 carloads; Pullman Co. (St. Louis), 8 carloads.

Dealers' buying prices, per gross ton, f.o.b. St. Louis district:

Youngstown

Valley Mills Operating at Close to Full Capacity—Shipments Exceed Volume of New Business

YOUNGSTOWN, Oct. 16.—Not since the recovery from the 1921 depression has the steel industry in the Mahoning and Shenango Valleys enjoyed such activity as in the first half of this month. While new business, as distinct from specifications and releases on old orders, generally is lighter than in the first half of September, it is running much larger than most steel company sales managers had expected, in view of the extraordinarily heavy flow of specifying, ordering and contracting in September. It was believed that this month's business might suffer by reason of the September rush of tonnage.

With the exception of tin plate and welded standard and oil country pipe, mill schedules are filled to the end of the month at least, and in sheets and bars well into November, while ingot production remains at full physical capacity. At the Ohio works of the Carnegie Steel Co. only one or two open-hearth furnaces, of a group of 15, are idle. The Sharon Steel Hoop Co. at Lowellville has all six of its open-hearth furnaces in production. There is full operation of furnaces at both the local and Warren plants of the Republic Iron & Steel Co., and all but four of the 24 open-hearth furnaces of the Youngstown Sheet & Tube Co. are producing. Of the 26 steel works blast furnaces, 19 are active.

Plant engagement of this sort makes for optimism, but it is somewhat restrained, in that there is doubt whether the present gait can be maintained through the remainder of the

year. It is recognized that, while new business is relatively good, it is not equaling production and shipments and that inroads are being made upon the order books. There is no disposition to overlook the fact that September's rush of business was partly accountable to the higher prices named for fourth quarter business. In the desire of buyers to escape the advances, there was probably a little more ordering than actual requirements suggested. Reserve stocks of consumers have been built up to some extent.

Birmingham

Tennessee Company Takes Off Five Open-Hearth Furnaces—Steel Demand Fairly Good

BIRMINGHAM, Oct. 16.—Pig iron sales the past week have been in small to moderate lots for nearby delivery. Buying is largely by quiet negotiation, and very few good-sized open inquiries are coming into the market. The volume of iron under contract for the last quarter is larger than it was at the early part of any other quarter in the past year. Shipments the first two weeks of this month have been slightly less than the weekly average for September, yet they have been about equal to production. On Oct. 7 the Tennessee company changed its Nos. 1, 2, 3 and 4 furnaces at Ensley from basic to foundry iron. The No. 2 Bessemer furnace of this company was banked on the same date. Eighteen furnaces are now in blast, of which 15

Prices present a firm front. Makers of sheets now are uniformly quoting black at 2.75c., base, galvanized at 3.50c., base, blue annealed at 2c., base, and automobile body sheets at 4c., base. Concessions are encountered in galvanized and black sheets, but blue annealed and body sheets are firmly held by all producers. Makers believe they should get more money for body sheets because of the quality exactations of the automobile body producers. They are actually getting some net advance by insisting upon consumers taking stock that is in accordance with specifications and by refusing to accept rejections based on some of the reasons advanced by consumers. Strip makers here are considering a new single base price and a new card of extras, although it is generally realized that not much business can take the new schedule until the first quarter of 1929, as so many consumers now are under contract for this quarter.

The pig iron market shows firmness. Producers quote No. 2 foundry at \$17, furnace, basic at the same price, Bessemer at \$17.50 to \$18 and malleable at \$17.50, but only small sales are being made.

A tight situation exists here in steel works grades of scrap, as dealers sold more than they had or have since been able to buy in the face of the pronounced strength in the Pittsburgh district. The local market is regarded as \$16.50 to \$17 for heavy melting steel, \$16 to \$16.50 for compressed sheets and \$12 to \$12.50 for machine shop turnings, the three grades most commonly used here. With the Pittsburgh market fully \$1 a ton higher on the first two grades and a difference of only about 40c. between the freight on Western shipments to this market and Pittsburgh, there is the possibility of Western scrap going past Youngstown. Local mill buying would probably advance prices, but local melters have so far succeeded in avoiding purchases supplementary to those of mid-summer.

are on foundry, two on basic and one on ferromanganese.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.....	\$16.25
No. 1 fdy., 2.25 to 2.75 sil.....	16.75
Basic.....	16.25

Finished Steel.—Orders for the first half of the present month were better than in the first two weeks of September. With the exception of steel rails, bookings in the past four weeks have been better than for the corresponding period in the past several seasons. The market is firm. Owing to the closing down of the Ensley rail mill of the Tennessee company on Oct. 7, its open-hearth operations have been reduced by the shutting down of five furnaces there.

Seven are active at Fairfield and the Gulf States Steel Co. is working four at Alabama City. Operations of other plants in the district are at a high rate. The fabricated structural steel market is slightly more active. Pending tonnage has been increased by the announcement that bids will be opened next month for 15 bridges in Alabama. The Virginia Bridge & Iron Co. has booked 6000 tons for the new plant of the American Enka Corporation, Asheville, N. C., about half of which will be fabricated at Birmingham and the remainder at Roanoke, Va. Reinforcing steel bookings are fair. The Connors Steel Co. has an order for 315 tons for a warehouse at New Orleans.

Cast Iron Pipe.—A light volume of small orders characterizes the market. No sizable tonnages have been placed in several weeks. Present inquiries are light. Makers continue to maintain quotations of \$36 to \$37 on 6-in. and larger sizes. Shipments are equal to current production.

Coke.—Foundry coke sales are fairly satisfactory in view of the extent to which the trade is covered by contracts. Demand for domestic coke sizes is increasing rapidly. Specifications against foundry coke contracts are active. Quotations are unchanged from the \$5 base for both spot and contract coke.

Old Material.—Demand is stronger than a week ago. Sales are holding up well. No changes have been made in prices since the slight readjustment reported last week. Firmness is noted. Dealers' stocks are the lowest in several months.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel.....	\$12.50
Scrap steel rails.....	\$12.00 to 12.50

Canada

Steel Business Continues at Satisfactory Level—Large Rail Orders Expected—Scrap Active

TORONTO, ONT., Oct. 16.—New business continues at a satisfactory level. The Canadian National and Canadian Pacific railroads have announced extensive rail laying programs for next year requiring large tonnages of rails. The rail mills at Sydney, N. S., and Sault Ste. Marie, Ont., are still in operation, orders on hand being sufficient for a month, by which time it is expected that new Canadian orders will be forthcoming. Mills report good business in other departments.

Pig Iron.—Business in this market is steady, but no outstanding purchases are reported. As many buyers are covered to the end of the year, contract placing is practically at a standstill, although two or three such orders were taken for lots under 500 tons. The demand for merchant iron for prompt delivery is active; orders for one and two car lots are numerous. About 1000 tons was closed the past week for spot delivery. Shipments are large. The iron melt is higher than a year ago. Pig iron prices are firm in both Toronto and Montreal markets.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75.....	\$23.60
No. 2 fdy., sil. 1.75 to 2.25.....	23.60
Malleable	23.60
Delivered Montreal	
No. 1 fdy., sil. 2.25 to 2.75.....	25.00
No. 2 fdy., sil. 1.75 to 2.25.....	25.00
Malleable	25.00
Basic	24.00
Imported Iron, Montreal Warehouse	
Summerlee	33.50
Carron	33.00

Structural Steel.—Canadian fabricators report a steady flow of new orders, which, together with orders

on their books, assure capacity operations for some time to come. Large tonnages are in prospect for bridge and building projects. The Hamilton Bridge Co. estimates production for this year for its Hamilton plant at 32,000 tons. The Sarnia Bridge Co., Sarnia, Ont., has closed a number of orders during the past few weeks, and it is expected that it will receive a portion of the steel contract for the new bridge across the St. Clair River

between Sarnia and Port Huron, Mich. Recent orders include: 500 tons of steel to the Canadian Vickers, Ltd., Maisonneuve, Que., for an office building at Craig and Cote Streets, Montreal; 400 tons to the Canadian Bridge Co., Walkerville, Ont., for Canadian Pacific bridge on Sandwich Street, Windsor; 200 tons to the Hamilton Bridge Co. for factory for National Hosiery Co. and 100 tons for N. Slater factory at Hamilton, Ont.; 100 tons reinforcing bars to Steel Co. of Canada, Ltd., for National Hosiery Mills, Hamilton; 200 tons structural steel to Dominion Bridge Co., Ottawa, for hotel at Brockville, Ont.

Old Material.—A strong spot demand continues. Movement of scrap on contracts is large. Heavy melting steel and machinery cast were the most active grades during the week, large orders coming from Toronto and Hamilton consumers. Toronto dealers offer \$9.50 per gross ton for heavy melting steel, but despite this higher price the supply is not greatly in excess of demand; machinery cast is being purchased by local dealers at \$15 per net ton. Montreal dealers now report a strong demand for scrap, with improvement in export business.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel.....	\$9.50	\$7.00
Rails, scrap.....	10.00	9.00

Buffalo

Steel Plants Continue High-Rate Operations—Scrap Market More Active and Prices Advance

BUFFALO, Oct. 16.—Pig iron inquiry has been very light, but the prices recently established are holding. While some talk of higher prices is heard, producers realize that current quotations must be tested on tonnage before there is a further increase. This week's inquiries include one for 100 tons of malleable and one for 200 tons of high manganese iron from this district and two 500-ton inquiries for foundry iron from down State melters. Full differentials are being obtained on foundry iron in carload lots. Consumers are showing little interest in first quarter iron. Eleven furnaces are in blast. The Tonawanda Iron Corporation stack is scheduled to resume about the middle of November. Shipments of pig iron on the New York State barge canal

for the week ended last Saturday were about 900 tons. Total canal shipments for the season are about 70,000 to 75,000 tons.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25.....	\$17.00 to \$18.00
No. 2X fdy., sil. 2.25 to 2.75.....	17.50 to 18.50
No. 1X fdy., sil. 2.75 to 3.25.....	18.50 to 19.50
Malleable, sil. up to 2.25.....	17.50 to 18.50
Basic	17.00 to 17.50
Lake Superior charcoal...	27.28

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and struc. shapes.....	3.40c.
Soft steel bars.....	3.30c.
Reinforcing bars.....	2.75c.
Cold-fin. flats, sq. and hex.....	4.45c.
Rounds	3.95c.
Cold rolled strip steel.....	5.85c.
Black sheets (No. 24).....	4.20c.
Galv. sheets (No. 24).....	4.85c.
Blue ann'l'd sheets (No. 10).....	3.50c.
Com. wire nails, base per keg.....	\$3.60
Black wire, base per 100 lb.....	3.75

Finished Iron and Steel.—District mills are operating at a high rate. The Lackawanna plant of the Bethlehem Steel Corporation has 22 open-hearths active and most of its finishing mills are on double turn; the Donner Steel Co. has eight open-hearths in operation, and the Seneca Iron & Steel Co. is operating at about 92 per cent on sheets. Bars and shapes are in good demand. Prices on these products are 2.05c. to 2.10c., Buffalo. Sheet prices are well stabilized at 2.75c. for black and 4c. for automobile body grade. The galvanized price is steady at 3.55c. Sheet prices are sentimentally stronger than a week ago. Sheet deliveries are being extended. The R. S. McMannus Steel Construction Co. will fabricate 500 tons of structural for a new State normal school at Newark, N. Y.

Old Material.—The market is more active. Some scattered sales of heavy melting steel, strictly No. 1 grade, at \$16.50, are reported. Opinion is that if a mill entered the market for a tonnage of this material, it would have to pay \$16.50 to \$17. There is a scarcity of scrap here owing to heavier shipments to the Pittsburgh and Youngstown districts. A good deal of machine shop turnings and hydraulic compressed sheets is going into Pittsburgh and Youngstown. A few small lots of stove plate have been sold at

\$15 and some No. 1 machinery cast at \$16 to \$16.50. A number of short sales of stove plate are reported, dealers paying \$14.75 to cover. Scrap rails are a little stronger at \$15 to \$15.50.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades	
No. 1 heavy melting steel.	\$15.50 to \$16.50
No. 2 heavy melting steel.	14.00
Scrap rails	14.50 to 15.00
Hydraulic comp. sheets	14.00

Railroad	16.00 to 16.50
Agricultural	16.00 to 16.50

of 6-in. pipe, bids on which will be opened Oct. 17. Private business continues in excellent volume. There is a firmer price situation.

Coke.—With the additional coke produced by a battery of ovens started up first of last week, producers in this territory have been able to catch up with the demand. Calls for coke, however, continue in good volume. There has been no falling off in demand from foundries, indicating a fairly good improvement in melt by New England foundries, which have prospects of another month, at least, of excellent business.

Old Material.—Heavy melting steel was in brisk demand through the past week. Sellers continue to hold back materials to some extent, evidently expecting still higher prices. Stocks are low. Shipments of pipe have been larger than in some time. No. 1 steel was firmer at \$11.25 to \$11.75, while No. 2 steel was sold at \$9.75 to \$10.25. Most of the tonnage leaving here went to Pittsburgh.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	\$11.25 to \$11.75
Scrap T rails	10.00 to 10.50
Scrap girder rails	9.50 to 10.00
No. 1 railroad wrought	10.50 to 11.00
No. 1 yard wrought	8.00 to 8.50
Machine shop turnings	6.25 to 6.75
Cast iron borings (steel works and rolling mill)	6.50 to 7.00
Bundled skeleton, long	8.50 to 9.00
Forge flashings	9.00 to 9.50
Blast furnace borings and turnings	6.25 to 6.75
Forge scrap	6.50 to 7.00
Shafting	14.50 to 15.00
Steel car axles	16.00 to 16.50
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.50 to 10.00
Rails for rolling	10.50 to 11.00
Cast iron borings, chemical	9.50 to 10.00
<i>Prices per gross ton deliv'd consumers' yards:</i>	
Textile cast	\$14.00 to \$14.50
No. 1 machinery cast	15.50 to 16.00
No. 2 machinery cast	13.50 to 14.00
Stove plate	10.50 to 12.50
Railroad malleable	15.00 to 15.50

Boston

Scrap Market Continues Strong—Coke Demand Indicates Improvement in Melt—Pig Iron Firm

BOSTON, Oct. 16.—About 3000 tons of pig iron was disposed of in the New England market the past week, prices showing firmness on all transactions. The Mystic Iron Works sold about half of the total, while the remainder went to Buffalo furnaces. Several small tonnages of Indian iron also were sold. Prospects are brighter, based on the fact that machine shops are showing general activity and the stove makers are now in the midst of their heaviest producing season. New England foundries are increasing their melt.

Foundry iron prices per gross ton deliv'd to most New England points:

*Buffalo, sil. 1.75 to 2.25	\$21.91
*Buffalo, sil. 2.25 to 2.75	\$21.91 to 22.41
†Buffalo, sil. 1.75 to 2.25	20.78
†Buffalo, sil. 2.25 to 2.75	20.78 to 21.28
East. Penn., sil. 1.75 to 2.25	23.65
East. Penn., sil. 2.25 to 2.75	24.15
Va., sil. 1.75 to 2.25	25.71
Va., sil. 2.25 to 2.75	26.21
Ala., sil. 1.75 to 2.25	23.16 to 25.02
Ala., sil. 2.25 to 2.75	23.66 to 25.52

Freight rates: \$4.91 all rail and \$3.78 rail and water from Buffalo; \$3.65 from eastern Pennsylvania; \$5.21 all rail from Virginia, \$6.91 to \$8.77 from Alabama.
*All rail rate. †Rail and water rate.

Cast Iron Pipe.—What promises to be the largest pipe contract awarded by a New England municipality in years is the proposed installation of a new water system at Warwick, R. I.

The project will call for 14,000 tons of 6 to 30-in. pipe. Bids will be opened on Oct. 19. The only other municipal inquiry in the district is for 100 tons

Steel Scrap Up \$1 a Ton at Detroit

DETROIT, Oct. 16.—Further advances have been registered in the Detroit scrap market during the past two weeks, heavy melting steel showing an advance of \$1 per ton and blast furnace material is up 50c. per ton. Several large sales have been negotiated recently.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov.	
steel	\$13.00 to \$13.50
Borings and short turnings	9.00 to 9.50
Long turnings	8.00 to 8.50
No. 1 machinery cast	14.00 to 15.00
Automobile cast	19.00 to 20.50
Hydraul. comp. sheets	12.25 to 12.75
Stove plate	11.00 to 12.00
No. 1 busheling	10.00 to 10.50
Sheet clippings	8.00 to 8.50
Flashings	10.50 to 11.00

The Mary furnace, Sharon Steel Hoop Co., Lowellville, Ohio, is being equipped with a Steinbart washer.

Cincinnati

Steel Orders Satisfactory Though at Less Than September Rate—8000 Tons of Pig Iron Sold

CINCINNATI, Oct. 16.—Pig iron purchases the past week totaled approximately 8000 tons, most of which was for fourth quarter delivery. The largest individual order was for 2000 tons of foundry iron. An Evansville, Ind., melter took 500 tons of Northern and a like amount of Southern iron. Two Michigan users of Jackson County silvery iron each took 300 tons. Sales of iron on open inquiries have been small, recent major tonnages having been placed by means of private negotiation. Pending business is light. The price situation is favorable to producers, who are holding firmly to current schedules. The volume of unfilled orders at district furnaces makes unlikely any deviation from present quotations in the near future. Conditions at Ironton have not changed. One furnace interest there has no iron to offer and the other merchant producer has only small lots of various grades.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	\$18.89 to \$19.89
So. Ohio malleable	20.14 to 20.89
Ala. fdy., sil. 1.75 to 2.25	19.94
Ala. fdy., sil. 2.25 to 2.75	20.44
Tenn. fdy., sil. 1.75 to 2.25	19.94
So'th'n Ohio silvery 8 per cent	26.89

Freight rates, \$1.89 from Ironton and Jackson, Ohio; \$3.69 from Birmingham.

Coke.—Demand for by-product foundry coke has been fairly well sustained, although a prominent maker reports a slackening volume of specifications and orders. Shipments this month, however, will at least parallel those of September, and, in the case of several producers, will exceed last month's good record. Prices are showing strength. Indications are that by-product foundry coke will remain at \$7 per net ton, f.o.b. ovens, or \$9.14 delivered Cincinnati, during November, while domestic grades probably will be advanced 50c. a ton Nov. 1. A local dealer will supply 15,000 tons of beehive foundry coke to a district consumer during the next 12 months. A Chicago company is negotiating for

12,000 tons of furnace coke for its Nashville, Tenn., plant.

Finished Material.—Although bookings have not attained the level reached in September, district sheet mills are well satisfied with the volume of orders and specifications in the first half of October. Incoming business fell slightly short of production, but the accumulation of unfilled tonnage from the previous month insures the maintenance of operations at full capacity until at least Nov. 1. The well-rounded demand from all consuming lines has been especially gratifying to producers. Several of the largest automobile makers in the Detroit district have yet to place their requirements for new models, and, though sales to the public may fall off considerably, the necessity of manufacturing a substantial supply of cars for dealers assures the purchase of considerable automobile body sheet stock in the next 30 days. Prices are firm at 2.75c. to 2.85c., base Pittsburgh, for black, 2c. for blue annealed, 3.60c. to 3.70c. for galvanized and 4c. for automobile body sheets. Orders for cold-rolled strip steel have been of fair proportions. An important maker has today announced that its minimum price, effective immediately, is 2.85c., base Pittsburgh or Cleve-

land. Specifications of bars, shapes and plates have fallen off somewhat, but mills are having difficulty in making prompt deliveries. The wire goods market is quiet. Common wire nails are bringing \$2.69 per keg, delivered in Cincinnati.

Old Material.—The scrap market remains turbulent, and dealers are making every effort to acquire certain grades of material of which there is a shortage. Railroads received high prices for many of the items offered last week and a fair amount of this tonnage was bought by local dealers. District steel plants apparently are not buying for forward delivery, but nevertheless are accepting shipments on current contracts at a normal rate. That they will make purchases in the near future is the opinion in this market. Meanwhile, the entire schedule is strong at the prices quoted below.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	\$13.50 to \$14.00
Scrap rails for melting	 13.50 to 14.00
Loose sheet clippings	 9.50 to 10.00
Bundled sheets	 10.25 to 10.75
Cast iron borings	 9.25 to 9.75
Machine shop turnings	 8.75 to 9.25
No. 1 busheling	 10.75 to 11.25
No. 2 busheling	 6.50 to 7.00
Rails for rolling	 13.75 to 14.25
No. 1 locomotive tires	 13.50 to 14.00
No. 2 railroad wrought	 13.50 to 14.00
Short rails	 18.25 to 18.75
Cast iron carwheels	 12.50 to 13.00
No. 1 machinery cast	 17.50 to 18.00
No. 1 railroad cast	 14.25 to 14.75
Burnt cast	 10.50 to 11.00
Stove plate	 10.50 to 11.00
Brake shoes	 10.25 to 10.75
Railroad malleable	 13.50 to 14.00
Agricultural malleable	 12.50 to 13.00

Black & Decker Buys Motor Works

Black & Decker Co., Towson, Md., has purchased the plant of the Domestic Electric Co., Cleveland manufacturer of fractional horse power motors. The plant of the Van Dorn Electric Tool Co., Cleveland, was purchased a few months ago by the Black & Decker Co. and with the acquisition of the Domestic plant it was stated that the Maryland company becomes a self-contained unit, making all parts used in the manufacture of electric drills, hammers and other tools in its line of products. Carl A. Duffner, president Domestic Electric Co. since its organization 15 years ago, will remain as the head of that company as will also Alfred N. Kellogg, treasurer, and Milton H. Spielman, vice-president.

Timken Acquires Wooster Tube Plant

The Timken Steel & Tube Co., subsidiary of the Timken Roller Bearing Co., Canton, Ohio, has purchased for \$200,000 from John C. Schultz, receiver, the Weldless Tube Co., Wooster, Ohio. This plant was built in 1922 and is equipped with a piercing mill, an automatic rolling mill and 10 stands of reducing rolls, together with heating, swaging and annealing fur-

naces and a pickling and treating department for boiler tubes. It has a rated annual capacity of 18,000 tons and the product includes locomotive and marine boiler tubes and cold-drawn seamless tubing in sizes from ½ in. to 3¼ in. in diameter. With the plant the purchaser secures 100 acres of land. The Canton company expects to place the Wooster plant in operation shortly.

Open Meeting to Consider Steel Making Problems

A discussion of important problems in steel making has been organized for Friday, Oct. 19, by the metallurgical advisory board to Carnegie Institute of Technology and United States Bureau of Mines. As has been noted frequently in the past, these organizations are conducting an extended research into the fundamentals of steel making. Meetings held on Oct. 19 will be open to all interested listeners, and will be held in the auditorium, Bureau of Mines Station, Pittsburgh. In addition to the problems of slag formation and reaction with steel, other items for consideration will include case carburizing, X-ray investigations, and iron-manganese alloys. After an informal dinner at Pittsburgh Athletic Association, Dr. W. H. Hatfield, director of research, Brown-Firth Research Laboratories, Sheffield, England, will speak.

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.
Plates and struc. shapes	3.40c.
Bars, soft steel or iron	3.30c.

4-in.	39.00

Non-Ferrous Metal Markets

Copper Inactive But Firm, Tin Sales Moderate, Lead and Zinc Quiet and Unchanged

Copper.—Columbus Day, Oct. 12, was a generally observed holiday in this and other non-ferrous markets, and, followed by a Saturday, activity slowed down. Buying by domestic consumers is spasmodic and, where large tonnages are involved, December is the usual delivery period. A few consumers still need a little October and November metal which they seem able to obtain. Foreign sales have been larger than domestic, with November-December generally involved,

THE WEEK'S PRICES. CENTS PER POUND FOR EARLY DELIVERY					
	Oct. 16	Oct. 15	Oct. 13	Oct. 11	Oct. 10
Lake copper, New York.....	15.25	15.25	15.25	15.25	15.25

*Refinery quotation; delivered price ¼c. higher.

though some October metal is still being bought. September statistics were quite favorable to sellers with a loss in stocks of about 3000 tons of copper in the refined and blister condition and with shipments to domestic consumers about 88,700 tons, the largest on record. Foreign shipments were about 51,300 tons, making the month's total about 140,000 tons, compared with 143,600 tons in August. Stocks of refined copper on Oct. 1 were about 51,000 tons, the lowest in many years. Prices are unchanged, with electrolytic copper selling at 15.25c., delivered in the Connecticut Valley, and with the foreign quotation at 15.50c., c.i.f., usual European ports. Lake copper is moderately active and

stocks are very low, with quotations unchanged at 15.25c. to 15.50c., delivered.

Tin.—Sales for the week ended Saturday, Oct. 13, were about 650 tons, with the market very dull. Consumers are largely absent from the market, indicating that they have ample supplies. On Monday, only about 100 tons changed hands and on Tuesday also the market was dull. Spot Straits tin on Tuesday was quoted at 48.50c., New York. Sales in London Tuesday of only 10 tons of spot and 90 tons of futures are said to have been the smallest on record. Quotations were as follows: Spot standard, £220; future standard, £218, and spot Straits, £220 10s. Arrivals

thus far this month have been 1990 tons, with 8635 tons reported afloat.

Lead.—Only moderate activity is reported, consumers purchasing October-November metal. The leading interest continues to quote 6.50c., New York, as its contract price, and the prevailing quotation in the West is 6.32½c., with a little metal available from one or two sources at 6.30c., St. Louis.

Zinc. — Statistics for September showed an increase in stocks of refined metal of about 3000 tons, but this is offset by a large decrease in the number of refiners operating on Oct. 1. Quotations for prime Western are firm and unchanged at 6.25c., East St. Louis, or 6.60c., New York. Demands from consumers, however, are not heavy, although buying by galvanizers may develop in the near future. It is believed by some that their stocks are low.

Antimony.—The market is a little easier with Chinese metal for spot delivery available at 11c. to 11.25c.,

New York, duty paid, with futures holding at 10.75c.

Nickel.—Quotations are unchanged at 35c. per lb. for ingot, 36c. for shot and 37c. for electrolytic nickel in wholesale lots.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Oct. 16.—Sales are more active but the bulk of business is for early delivery. Prices are steady except in tin and antimony. The old metal market is moderately active.

Prices, per lb., in carload lots: Lake copper, 15.50c.; tin, 49.75c.; lead, 6.40c.; zinc, 6.35c. in less-than-carload lots; antimony, 12.25c. On old metals we quote copper wire, crucible shapes and copper clips, 10.75c.; copper bottoms, 9.75c.; red brass, 9.50c.; yellow brass, 7.25c.; lead pipe, 4.75c.; zinc, 3.50c.; pewter, No. 1, 30c.; tin foil, 36.25c.; block tin, 45.25c.; aluminum, 12c., all being dealers' prices for less-than-carload lots.

Reinforcing Steel

Chicago Hotel Takes 1000 Tons of Bars

AWARDS of about 5200 tons of bars included 1000 tons for a Chicago hotel and 500 tons for subway construction in New York. Among inquiries totaling 3600 tons are 1200 tons for a building in Chicago for the Western Electric Co. and 500 tons for the Powhatan Hotel, Chicago. Awards follow:

NEW YORK, 500 tons, subway work; 300 tons from Carroll Co., general contractor, and 200 tons from Clementi Contracting Co., to Concrete Steel Co.

NEW YORK, 160 tons, building on Broad Street for Lee, Higginson & Co., to Carroll-McCreary Co., Inc.

NEW YORK, 120 tons, miscellaneous work in Mott Haven yards of New York, New Haven & Hartford Railroad, to Concrete Steel Co.

BROOKLYN, 110 tons, building for St. John's Law School, to Carroll-McCreary Co., Inc.

BROOKLYN, 100 tons, public school No. 96, to Tidewater Structural Materials Corporation.

HASTINGS-ON-HUDSON, 130 tons, factory building for American Brass Co., to Fireproof Products Co.

NEW CITY, N. Y., 100 tons, Rockland County Court House, to Fireproof Products Co.

HORNELL, N. Y., 100 tons, sewage treatment work, to a Buffalo maker.

NEWARK, N. J., 130 tons, Essex County Girls' Vocational School, to Tidewater Structural Materials Corporation.

HENDERSONVILLE, N. C., 150 tons, hotel, to Connors Steel Co.

LOUISVILLE, KY., 350 tons, recreation building, to Laclede Steel Co.

NEW ORLEANS, 315 tons, Atlantic & Pacific Tea Co. warehouse, to Connors Steel Co.

COLUMBUS, OHIO, 500 tons, grade crossing for Norfolk & Western Railroad, to Truscon Steel Co.

CHICAGO, 100 tons of rail steel bars, garage at Lamon and Madison Streets, to Calumet Steel Co.

CHICAGO, 1000 tons, hotel on Walton Place, to an unnamed bidder.

CHICAGO, 300 tons, building for Patterson Estate, to Jones & Laughlin Steel Corporation.

CHICAGO, 500 tons, warehouse for John Sexton & Co., to American System of Reinforcing.

CHICAGO, 100 tons of rail steel bars, apartment building at Sixty-seventh and Jeffery Streets, to Olney J. Dean & Co.

CHICAGO, 200 tons of rail steel bars, hotel at 617 West Madison Street, to Olney J. Dean & Co.

SPRINGFIELD, ILL., 300 tons of rail steel bars, State highway work, to unnamed bidder.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

NEW YORK, 185 tons, Evander Childs High School; John T. Brady & Co., general contractors.

NEW YORK, 110 tons, warehouse on East Thirty-sixth Street for New York Steam Corporation; Turner Construction Co., general contractor.

NEW YORK, tonnage being estimated, laboratory on Bank Street for Bell Telephone Laboratories, Inc.; Turner Construction Co., general contractor.

BROOKLYN, 400 tons, building for Brooklyn Ash Removal Co., Inc.; United Fireproofing Co., general contractor.

JERSEY CITY, 3000 tons, terminal warehouse for Delaware, Lackawanna & Western Railroad Co.; reported last week as requiring 2000 tons.

CLEVELAND, 100 tons, Cleveland Union Terminals Co.

CHICAGO, 500 tons, Powhatan Hotel.

CHICAGO, 1200 tons, building for Western Electric Co.

CHICAGO, 900 tons, six public schools.

OAKLAND, CAL., 248 tons, south spillway for East Bay Municipal Utility District; general contract to Ward Engineering Co.

OAKLAND, 100 tons, Pardee Reservoir, East Bay Municipal Utility District;

general contract to Ward Engineering Co.

SAN FRANCISCO, 675 tons, Sears-Roebuck Co. warehouse; bids being taken.

BERKELEY, CAL., 1800 tons, science building for University of California; general contract to Dinwiddie Construction Co.

SANTA CRUZ, CAL., 225 tons, hotel; general contract to Carl Swenson.

SACRAMENTO, CAL., 129 tons, highway work in Orange County; bids Oct. 30.

Railroad Equipment

Great Northern Orders 500 Steel Underframes

Orders for 500 steel underframes, for the Great Northern, and 25 dining cars, for the Southern Pacific, are the more important items of a quiet week in railroad equipment. Details follow:

Great Northern has ordered 500 steel underframes from Pressed Steel Car Co. and will build steel box car bodies in its own shops. This road has also made formal inquiry for 1000 ore cars and will soon ask for bids on 500 general service gondola cars. Preliminary announcement of these inquiries was made in THE IRON AGE of Aug. 9.

Canadian National is inquiring for 300 flat cars. This is in addition to its inquiry for 1500 box and 30 tank cars reported recently. This road is also expected to come into market for five buffet parlor, five mail and express and 10 sleeping cars in addition to 25 coaches, 15 sleeping and two combination baggage and smoking cars now under negotiation.

Maine Central has ordered four box cars from Standard Steel Car Co.

Youngstown Sheet & Tube Co. has ordered 200 mine cars from Enterprise Wheel & Car Corporation.

Southern Pacific has ordered 25 dining cars from Pullman Car & Mfg. Corporation.

Texas & Pacific will take preliminary figures on 75 caboose car underframes.

Chicago & North Western is in the market for 100 caboose car underframes.

Production of bituminous coal in the week ended Oct. 6 is reported by the United States Bureau of Mines at 11,028,000 net tons. This is about the same output as in the preceding week, which was the highest in several months. It brings production for the calendar year to 364,002,000 tons, compared with 403,157,000 tons in the corresponding portion of 1927 and 414,634,000 tons in 1926.

Orders received by the General Electric Co., for the three months ended Sept. 30, amounted to \$90,328,666, compared with \$77,420,263, for the corresponding quarter of 1927, an increase of 17 per cent. For the nine months ended Sep. 30, orders received amounted to \$260,686,463, compared with \$233,076,091, for the first nine months of last year.

PERSONAL

ALEXANDER E. WALKER, new general manager of sales for the Republic Iron & Steel Co., Youngstown, was graduated from the engineering department, University of Michigan, in 1910. He joined the Riter-Conley Co. just after completion of his college course and for almost a year was en-

A. E. WALKER

gaged in fabricated steel erection work. In 1911 he left that company to go with the La Belle Iron Works, Steubenville, Ohio, and after a brief connection with the general sales department of that company, was transferred to the Chicago district sales office. On Feb. 1, 1916, he joined the Republic company, as assistant manager of pipe sales and in 1919 was made assistant general manager of sales in charge of pipe and sheets. When the Republic sales department personnel was recast following the absorption of Trumbull Steel Co. early this year, he was made assistant general manager of sales with supervision over all products of the company.

GEORGE B. WHITWELL is president and treasurer, FRANK GOULD, vice-president and director of sales, and JOHN H. WHITWELL, secretary, of the McCaffrey File Corporation, which has been formed to take over the business and assets of the McCaffrey File Co., Fifth and Berks Streets, Philadelphia. Mr. Gould was associated for 30 years with Henry Disston & Sons, Inc., Philadelphia, and for five years with George H. Bishop & Co., Columbus, Ohio.

DR. ROBERT J. ANDERSON, vice-president Fairmont Mfg. Co., Fairmont, W. Va., arrived in New York Oct. 5, after an extended trip through Europe. He visited a number of the principal aluminum plants abroad and made a study of the foreign aluminum situation.

JOHN W. McMAHON has been appointed superintendent of the cold strip department at the Warren, Ohio, works, Republic Iron & Steel Co., succeeding H. A. FISHER, who resigned recently. Before going to Warren, Mr. McMahon was associated for 25 years with the Superior Steel Corporation, Carnegie, Pa., having served for 10 years as superintendent of the cold rolling department.

C. R. ELLICOTT, formerly superintendent Lehigh mills and furnaces, Bethlehem, Pa., plant, Bethlehem Steel Co., has been appointed assistant general manager of the Bethlehem company's Cambria plant, Johnstown, Pa. He succeeds F. A. SCAMMELL, who has resigned.

MAXIMILIAN N. BODENBACH, formerly chief engineer Electro-Mechanical Engineering Co., Milwaukee, has established offices at 502 Commerce Building, Milwaukee, for the practice of engineering advisory to manufacturers, inventors and architects on electrical problems.

A. C. DENISON has been elected president of the Fulton Foundry & Machine Co., Cleveland, succeeding A. E. GIBSON, who has resigned to become works manager of the Wellman-Seaver-Morgan Co., Cleveland. Mr. Denison was formerly connected with the Fulton foundry but for the past six years has been manager of the Euclid Foundry Co., Euclid, Ohio.

JOSEPH W. IVY, for 15 years manager of the Kansas City office of the American Cast Iron Pipe Co., Birmingham, has resigned to become Western sales manager for the National Cast Iron Pipe Co., with headquarters in the Land Bank Building, Kansas City. Control of the National company was recently obtained by James B. Clow & Sons, Chicago.

CHARLES RAMSDEN has been appointed general manager of the Pacific Coast Engineering Co., Oakland, Cal. He was chief engineer of the Western Pipe & Steel Co. from 1909 to 1919, when he resigned to become president of the Steel Tank & Pipe Co., Berkeley, Cal.

GEORGE KELMAN has joined the engineering and sales organization of the Welded Products Co., Birmingham. He has had 12 years' experience in steel tank and plate work, having been previously connected with the Petroleum Iron Works, Sharon, Pa.; the International Petroleum Co., Tampico, Mexico; the Gulf Refining Co., Port Arthur, Tex., and the Birmingham Tank Co., Birmingham.

HUGH MORROW, president Sloss-Sheffield Steel & Iron Co., Birmingham, has been made a director of the Central of Georgia Railway Co.

WILBUR B. TOPPING, whose resignation as general manager of sales Republic Iron & Steel Co., Youngstown, was mentioned in THE IRON AGE last week, has been appointed general manager of Western sales for the Bethlehem Steel Co., with headquarters at Pittsburgh. He has been active in the steel industry for 21 years. He attended Lehigh University for two years and then transferred to the University of Pennsylvania, from which he was graduated in 1907. He then went into the operating department of the Tennessee Coal, Iron & Railroad Co., Birmingham, serving for two years in various capacities, in which he acquired a thorough knowledge of the manufacture of iron and steel. He was transferred in 1909 to the Pioneer furnaces of the

W. B. TOPPING

Republic company at Thomas, Ala., and a little later to the Youngstown mills. In 1911, he went into the sales department of the company in the general offices, then located in Pittsburgh, and in 1912 was sent to the company's New York sales offices. That year he opened and was first manager of the Philadelphia district sales office, holding this position until 1914, when he was appointed Cleveland district sales manager, with the offices at Detroit and Buffalo under his jurisdiction. Later that year he was promoted to assistant general manager of sales, with headquarters in Youngstown and in 1919 was advanced to the position he recently relinquished.

EUGENE J. MANN, formerly with the Independent Foundry Co., Portland, Ore., has purchased the Vancouver Iron & Steel Co., Vancouver, Canada, of which concern he is now president and treasurer. He is secretary of the board of the Oregon Manufacturers' Association, and was formerly president of the United Metal Trades.

CALVIN R. MCGAHEY has been appointed to the sales engineering force of the Hill Clutch Machine & Foundry Co., Cleveland. He has specialized in the handling of power transmission equipment in the Southern section of the country, which territory he will cover for the Hill company, the territory comprising Virginia, Tennessee, North and South Carolina, Georgia, Alabama, Florida, Mississippi and Louisiana.

CHARLES WARDLOW, head of S. & C. Wardlow, Sheffield, England, otherwise known as the Portobello Steel Works, makers of crucible steel

CHARLES WARDLOW

and rustless iron, particularly sheets for cutlery and saws and steel for files, made a hurried visit to the United States, chiefly to visit the exposition at Philadelphia last week of the American Society for Steel Treating. He reports expanding sales, including business with the United States and on the Continent, and a

Swelling of Coal During Rapid Coking

It is common knowledge that the semi-bituminous coals give trouble from sticking of the coke in the retort or even after carbonizing. This is probably because the cokes do not shrink appreciably during the latter stages of carbonization, as do those from coals higher in volatile matter. Abnormal swelling during coke formation would cause sticking, but this is not observed with semi-bituminous coals when coked at normal rates.

Experiments at the United States Bureau of Mines' Pittsburgh experiment station have shown, however, that even semi-bituminous coals can be made to swell when coked at extremely rapid rates, as in the crucible coking test. If the temperature is raised to 900 deg. C. in 1 min. a strongly swollen button will result, whereas with the higher volatile coals swelling is not so pronounced. Re-

generally improved outlook with no labor troubles in England in prospect. He sailed for England on Oct. 13 after being barely a week in America. He was accompanied at Philadelphia by Sears and King Hoyt and V. A. Greene, all of the Edgar Allen Steel Co. and A. Milne & Co., New York, who represent the Wardlow company in the United States.

L. P. ROSS, who has been at the Newcastle, New South Wales, plant of the Broken Hill Proprietary Co., Ltd., as consulting engineer for nearly two years, returned to New York this week. His work at Newcastle was chiefly the modernizing of the Broken Hill Company's blast furnaces. For several years previous to 1926 Mr. Ross was vice-president in charge of operations of the Replogle Steel Co. at Wharton, N. J.

R. J. WORKING has been appointed district sales manager for the Cincinnati district, with headquarters at 1320 Union Trust Building, that city, for the Central Alloy Steel Corporation. For some years he has been associated with the corporation's sales department at the general offices at Massillon, Ohio. He succeeds J. O. DEARTH, who has resigned.

ARTHUR G. EATON, recently elected vice-president and director of sales of the Aluminum Industries, Inc., Cincinnati, is in charge of general sales offices opened by the corporation in the Fisher Building, Detroit. For 15 years Mr. Eaton was connected with Dodge Brothers, Inc., the last four as director of the purchasing department. Heretofore Aluminum Industries has been represented in Detroit by B. J. PLUMLEY, engineer, serving in a technical capacity. Mr. Plumley will be associated with Mr. Eaton.

sults of the crucible test should not be taken as indicative of the ease with which coke made from it can be pushed out of the oven, since, although they do show abnormal swelling with coals which stick in the retort, the sticking is due rather to failure to shrink than to swelling during coke formation.

Rubber Binders Developed for Foundry Cores

A foundry core sand binder, using rubber as its basis, has been developed by the United States Bureau of Standards, Washington.

The outstanding advantages of the binder, according to the *Technical News Bulletin* of the Bureau, are:

The cores crush readily, falling to loose sand of their own accord, so that the core sand may be poured from the casting instead of having to be dug out.

The cores have greater strength

than green sand cores and extend the range of jobs to which a readily crushed core may be applied.

The cores are not oven baked; they are merely air-dried.

The cores are of high permeability and show remarkable freedom from blowing.

The rubber core binder consists, essentially, of a solution of unvulcanized rubber in gasoline. The amount and type of rubber binder used in making cores depend upon the type of core sand, the size of the core and the metal to be cast around it. A core strength equivalent to that of green sand cores or baked oil sand cores can be attained by the use of the rubber binders. The new binders have proved to be successful in producing sand cores for castings of lead, tin, zinc, brass, phos-bronze, bronze, aluminum, iron and steel.

The rubber types of binders are discussed in considerable detail in Letter Circular No. 252, "Rubber Binders for Foundry Cores," which is now ready for distribution.

New Otis Steel Furnace

The Otis Steel Co., Cleveland, shortly will begin the erection of another open-hearth furnace, the third to be built this year. With the completion of this furnace the company will have a fully rounded out steel plant with eight open-hearth furnaces at its Riverside plant, which together with five furnaces at its Lakeside plant will give it an annual capacity of 840,000 tons of steel ingots or sufficient to supply all the semi-finished steel required for its finishing mills.

Obituary

SILAS M. HAIGHT, for several months research engineer Sweet's Steel Co., Williamsport, Pa., was killed Sept. 30 in an automobile accident near Liverpool, Pa. He was a graduate of Lafayette College, Easton, Pa., and before going with the Sweet's company, had been associated with the Highway Products Mfg. Co., Elmira, N. Y.

EDWARD H. SWINDELL, treasurer of William Swindell & Brothers, Pittsburgh, builders of steel works and glass plant furnaces, died at his home in that city, Oct. 11. Mr. Swindell was 61 years old and had been identified with this company, of which his father was one of the founders in 1853, during his entire business life. He was also president of the American Dressler Tunnel Kilns, Inc., and of the New Castle Refractories Co. He was a member of the American Iron and Steel Institute.

Gas manufactured in the East St. Louis and Granite City, Ill., plants of the Illinois Power & Light Corporation, will be piped to Staunton, Mount Olive and Carlinville, Ill., by the way of Edwardsville, a distance of more than 50 miles.

Spain Making Industrial Progress

Visit of Iron and Steel Institute of Great Britain Gives
Evidences of New Stabilization—Two American
Steel Men in Group Received by Queen

BILBAO, SPAIN, Sept. 27.—After an interval of 32 years, the British Iron and Steel Institute came again to Bilbao for its second autumn meeting. Four members who participated in the earlier visit were present, among them Past-president F. W. Harbord, who, in 1896, presented a paper in conjunction with T. Twyman on "The Presence of Fixed Nitrogen in Steel." Another of the "veterans" was H. Spence Thomas, a prominent South Wales tin plate maker, who enlivened a long and tedious rail journey with pleasant reminiscences of the 1896 meeting.

In the hospitality extended to the hundred members who made the journey, the Spanish meeting compared very favorably with meetings held in other countries, and those who remember the institute's visit to Sweden two years ago know that no greater compliment could be paid to the Spanish hosts than by making this comparison. The main party left London on Sept. 21, which gave a whole day in the beautiful seaside resort of San Sebastian, the capital of the province of Guipuzcoa. Here, a delegation from the institute, headed by President Benjamin Talbot, was received by the Queen of Spain and by the Queen Mother. Two American members were chosen to join this delegation—C. S. Robinson and Mrs. and Miss Robinson of Youngstown, and R. H. Irons and Mrs. Irons of Harrisburg, Pa. The members were also received by the Provincial Government of Guipuzcoa and the municipality of San Sebastian, and a happy day spent in delightful surroundings was appropriately concluded with a dinner and dance given by the provincial and municipal authorities, and the works of the Province of Guipuzcoa. Monday was devoted to a tour by motor from San Sebastian to Bilbao, and en route the party visited the car works at Besain and an exhibition of art metal work at Eibar.

Spain Making Industrial Progress

The arrival in Bilbao was marked by the same cordiality, and here it was possible to notice the steady development that has been going on in the country during recent years. The present regime in Spain has an excellent record of achievement, and under its control order and prosperity now reign where there were confusion and waste. Spanish finances have been set in order; revenue now exceeds expenditure, and the country has money for investment. Rail-

roads, highways, harbors, canals, and the rivers are being developed. Labor has been organized on a cooperative plan, and there is machinery for preserving peace in industry.

The hub around which revolves the system of government-controlled industry and trade is the National Economic Council, created in 1924. Each trade and industry has its council, whose representatives sit on the National Industrial Council. This body can refuse permission for the establishment of a new industry, or even in some cases grant entrance permits for machinery free of duty. It controls the customs tariff and valuations and dictates its policy to the ministerial departments.

Ore and Steel Output Increasing

It has often been stated that the iron mines in Vizcaya were nearing exhaustion, but today this condition seems little, if any, nearer than in 1896. The output during that year amounted to 5½ million tons, and in 1913 it jumped to 9½ million tons, but it declined to 3¼ million tons in 1926 to advance again to just under 5 million tons in 1927. Pig iron output, which in 1896 amounted to 297,000 tons, advanced during 1927 to 612,000 tons, and iron and steel output rose from 100,000 tons in 1896 to 600,000 tons in 1927. There are 93 shipping companies in Spain with a total capital of 400 million pesetas in shares and 221 million pesetas in debentures. The gross steam tonnage in 1896 was 485,441 tons; in April, 1928, it was 1,127,037 tons. The electrical development in the country will, when completed, give an output exceeding 2500 million kilowatts, which is equivalent to 2500 million tons of coal. The total wealth of Spain is estimated at 220,000 million pesetas; mining accounting for 7000 million, industrial production 48,000 million and railroads for 5000 million pesetas.

Civic Authorities Welcome Visitors

The opening meeting of the conference, held on Sept. 25, at the Alfonso XIII High School, was attended by high civic authorities, and was addressed by the president of the Bilbao reception committee, Count de Zubiria, director of the Altos Hornos Co. of Vizcaya, and Senor D. Alfonso de Churrua, assistant manager of the Altos Hornos Co. In extending a cordial welcome to the visitors, they spoke of the high industrial development in Spain.

The president of the institute, Ben-

jamin Talbot, in thanking the hosts, mentioned that the excellent quality of the steel made in Spain during the Middle Ages was attested by the fact that in Shakespeare's day the word "bilbo" meant rapier. Mr. Talbot pointed out that the beginning of systematic exploitation of Spanish ores coincided approximately with the rise of the Bessemer process. It was in that period that Bessemer steel rails were introduced. Owing to the great railroad developments, the demand for Bessemer steel rails increased so rapidly that, unless an ample supply of the very pure ores of the Bilbao district had been obtainable, it would have been impossible to keep pace with the demand. Notwithstanding the approaching exhaustion of some of the better mines, the prosperity of Bilbao had not declined, and there had sprung up a number of new prosperous manufacturing industries, for the maintenance and conduct of which the local conditions were well adapted.

Visits to Steel Works

The remainder of the meeting was devoted to a reading of a selection of papers, after which there was a reception at the Town Hall by the Lord Mayor of Bilbao, followed by a luncheon party at the Bilbaina Club, with the mining companies of Vizcaya as hosts. In the afternoon the members were conveyed by launch to the steel works of the Altos Hornos Co. at Sestao, then by special train to the Baracaldo works of the same company, which is near the Geldarmes mining area, from which it draws a portion of its ore and limestone.

The Baracaldo works was founded in 1854. It is equipped with five batteries of coke ovens of the Solvay and Carves types, with a production of 80 tons per 24 hr. for each battery. There is a group of four blast-furnaces, each furnace giving an output of 250 tons of metal per day, which is converted by the Bessemer process. Three basic open-hearth furnaces are nearing completion. The electrically driven cogging mill has rolls of 2.750 x 1.941 mm., and can treat ingots of from two to five tons, rolling them into slabs down to 300 x 300 mm. The reversible mill has four stands, on which, in addition to the flats, beams up to 700 mm., rails up to 50 kilos, and angles from 150 x 100 mm. can be rolled. Power is obtained from steam generators using waste gases from the blast furnaces and the coke ovens.

The Altos Hornos Co. has devoted

considerable attention to welfare work among its employees, providing schools for children, a savings bank, hospitals and a pension fund for the widows and orphans of employees.

Iron Mines Are Inspected

On Wednesday, Sept. 26, the iron mines of the Orconera, the Franco-Belga and Dico & Setares were visited. The principal features of these mines were described in Mr. Balzola's paper and it is unnecessary to refer to them again except to point out the wide expansion of mechanical conveying. The party then returned to Bilbao, when the afternoon was devoted to the further reading of papers. In the evening the members were entertained at a dinner and dance at Las Arenas by the Metallurgical Works of Vizcaya.

The concluding day of the conference was spent in visiting works in the neighborhood of Bilbao. One party visited the Basconia works which, beginning in 1893 with the manufacture of tin plate, has since added structural iron and steel work departments and sheet and plate mills. At the Echevarria works, the visitors saw the manufacture of high-speed tool steels and alloy steels as well as horseshoe nails and iron and steel wire. Babcock & Wilcox own a large works at Galindo for the manufacture of water tube boilers, railroad material, weldless steel tubes (hot and cold drawn), and construction material. The Construction Naval works which was visited is confined to shipbuilding, the construction of steam turbines and Diesel engines. Large forgings and castings for naval and armament purposes are constructed at the Reinosa works, which was not open to inspection. According to information supplied by Count de Zubiria, the foundry at Reinosa is equipped with three open-hearth and five electric furnaces, the first for the production of mild steel and the latter for nickel and chrome-nickel steels. In the forge shop are two Davy presses of 1000 and 3000 tons as well as reheating furnaces with capacity for 30 tons of ingots. In the rolling plant there is a 21-in. reversible mill constructed for rounds and squares, while two new sheet mills are being built.

Tour Extended to Madrid

At the conclusion of the Bilbao meeting, a tour was made further south in Spain. The party spent a week-end in Madrid, some of the members going on to the famous Sagunto works owned by Sota & Aznar, Ltd. The plant here was designed by Frank C. Roberts & Co. of Philadelphia, and the three mills in operation are capable of giving an annual output of 300,000 tons. Another party visited the ancient city of Toledo with its notable and artistic monuments bearing silent witness to the national greatness and power in centuries gone by. Here the party visited the Arms Factory. At Cordoba, still bearing traces of the

Roman and Arab occupations, a visit was paid to the copper works of the Compañia Electromecánica de Cordoba.

On the whole, the Spanish visit of the Iron and Steel Institute was as enjoyable as it was interesting. The impression brought back by the visitor to Spain is that of a nation determined to attain a leading position among producing countries, and, after satisfying its own requirements, to seek outlets in the markets of the world. Spain is steadily progressing along this path.

New Plan for Program of Blast Furnace Meeting

At the fall meeting of the Eastern States Blast Furnace and Coke Oven Association, to be held at the Shannopin Country Club, Ben Avon, Pa., Oct. 26, there will be a single round table discussion of coke oven and blast furnace topics. At other recent meetings of the association, separate gatherings have considered each division of its activities. The new arrangement is intended to permit wider interchange of ideas between those responsible for blast furnace operation and those in charge of coke plants than has been possible when separate sessions were devoted to blast furnaces and coke plants.

The program provides for luncheon at the club at noon, to be followed by the joint round table discussion, at which A. E. Maccoun, superintendent of blast furnaces Edgar Thomson works, Carnegie Steel Co., Braddock, will preside. Subjects listed for discussion are:

Comparison of practice and efficiency of the modern large blast furnace with the smaller furnace.

Discussion on distribution.

Coke made from high volatile coals versus coal made from a mixture of high volatile coals.

Furnace losses.

Improvements in blast furnace refractories.

Power, efficiency, and available surplus.

The relation between size of large bell and stock line diameter and its bearing on flue dust losses.

Recent improvements if any in blast furnace and coke oven refractories.

Following the dinner in the evening there will be a discussion of stream pollution, with special reference to coke plant wastes, to be participated in by W. L. Stevenson, chief engineer Pennsylvania State Department of Health; F. H. Waring, chief engineer Ohio State Department of Health; E. S. Tisdale, director division of sanitary engineering West Virginia State Department of Health, and F. W. Sperr, Jr., Koppers Co., Pittsburgh, and chairman phenol committee of the association.

Harry Saxer, assistant general superintendent Aliquippa works Jones & Laughlin Steel Corporation, is chairman of the committee of arrangements for the meeting, the other members of which are Douglas E. Price, Koppers Co., Pittsburgh; R. H.

Schaller, Jones & Laughlin Steel Corporation, Aliquippa, Pa., and H. M. Crossett, Bethlehem Steel Co., Johnstown, Pa.

Carnegie, Pa., Scrap Rate May Be Reduced

WASHINGTON, Oct. 16.—Rates on iron and steel scrap from Carnegie, Pa., to Weirton, W. Va., and Steubenville, Ohio, will be reduced to \$1.13 from \$1.39 per gross ton and to 76c. from a former rate of \$1.39 from Weirton and Steubenville to Carnegie if the Interstate Commerce Commission approves a report made public last Wednesday. The report, prepared by Examiner W. R. Brennan, based on a complaint by Charles Dreifus & Co. and other scrap dealers in Pittsburgh against the Pennsylvania Railroad. The 76c. rate from Weirton and Steubenville to Carnegie, the examiner held, was applicable from Jan. 15, 1927, and Sept. 1, 1927 respectively. The railroad contended that the 76c. rate did not apply on scrap but that it applied only on various kinds of billets and slabs in its tariff. The \$1.39 rate is the billet rate from Carnegie to Weirton and Steubenville, while the rate of \$1.13 is the pig iron rate from Carnegie to the latter two points. Award of reparation to the complainants was recommended by the examiner.

Studies Hand-to-Mouth Buying Practices

WASHINGTON, Oct. 16.—The Institute of Economics has completed the first draft in connection with a scientific study it has made on "Iron and Steel in Relation to the Tariff." The draft is now being revised by the council of the institute.

It will be three months or more before the institute completes its study on "hand-to-mouth buying" which is designed to check up on the reported widespread change in purchasing methods during the past 10 years. Purchasing agents are being asked how far ahead their companies have been in the habit of placing orders for two of the more important commodities purchased in 1914, 1918, 1922, 1924, 1926 and 1928; what proportion the approximate average inventory for those years has been of the year's needs; whether there has been any important change in inventories carried in proportion to annual requirements; whether there has been any definite improvement in purchasing technique during the past five years; whether buying is more frequent and in smaller quantities, and, if so, why. Iron and steel share prominently in the study, inquiries being sent out to 120 or 125 purchasing agents to ascertain size of orders placed, how far they are placed in advance of use as compared with previous periods, etc. Prices, unfilled tonnages, and other information also are being compiled.

Continental Prices Decline Slightly

Some Mills Grant Concessions—Export Rebates Spread in Europe—
Welsh-German Tin Plate Agreement Possible

(By Cable)

LONDON, ENGLAND, Oct. 15.

CLEVELAND pig iron makers have lost 15,000 tons of foundry iron for Scotland to Midland furnaces, at about 2s. (49c.) less than their agreed price. Export demand is poor and in general the domestic market is inactive, but prices are being maintained as output is held at an agreed maximum. Increased demand would necessitate blowing in additional furnaces.

Hematite iron is steadier and consumers show more interest in buying, so that some sales have been effected for first quarter delivery. Gjers, Mills & Co. are to resume operation of their Ayrshire works, with two furnaces in blast, in January. Foreign ore is quiet, with prices unchanged.

Finished steel is quiet in the ordinary merchant export trade, but moderate tonnages of steel are involved in Indian Government railroad contracts. Rolling mills buying their semi-finished steel in the open market have strengthened quotations because of the higher cost of their raw materials. Heavy plate mills need tonnage to maintain steady operation.

Tin plate is quieter and mills calling for next year delivery are accepting 18s. 3d. (\$4.43) per base box, f.o.b. works port. The current rate of output is down to 80 per cent of capacity, but mills are well booked for forward delivery, and some have sold half their production to next June.

Galvanized sheets are active in most markets, except India, and mills generally are well engaged to the end of November. There is some Japanese demand for light-gage black sheets, which is being filled by merchants with contracts, most mills being too well filled to ship before the end of the year.

September exports of pig iron were 30,000 tons of which the United States received 9600 tons. Total exports of iron and steel were 295,000 tons. Imports also decreased with the total September arrivals of all kinds, 185,000 tons.

The Continental situation is uncertain as some makers are reported more inclined to grant concessions and prices generally have receded slightly from the recent peak. The German Semi-Finished Steel Syndicate is a keen seller. Overseas demand for finished steel has diminished.

wages of 15 pf. (3.57c.) an hour. The Ingot Steel Syndicate has announced that no advance in prices will be made because of the impending 11 per cent increase in railroad freight rates, but states at the same time that prices will be marked up immediately if wages go up.

To determine the extent that prices have risen since January it is necessary to place sales of steel in three classifications, export, domestic and sales to exporting manufacturers receiving rebates. In the first six months of the year about 50 per cent of the production of steel was delivered to domestic users, about 33 per cent was sold for export and about 17 per cent went to exporting manufacturers. On the basis of prices obtained from the three classes of consumers, the average sales price increased 15 m. (\$3.57) per ton for bars, 7.50 m. (\$1.78) per ton for structural shapes, 9.50 m. (\$2.26) per ton for heavy sheets and 13 m. (\$3.09) per ton for medium gages of sheets.

Following the recent increase in export prices of steel, rebates of the Ingot Steel Syndicate for October have been reduced, as follows:

	October Rebate per Ton	September Rebate per Ton
Marks	Marks	
Ingots	14 \$3.33	17 \$4.05
Billets	15 3.57	19 4.52
Slabs	14 3.33	20 4.76
Light rails	37 8.80	40 9.52
Structural shapes	32 7.62	34.50 8.21
Bands	30 7.14	35 8.33
Bars	17 4.05	22.50 5.36
Heavy sheets....	24 5.71	28 6.66

The pig iron market is quiet and prices show a tendency toward weak-

German Sales Prices Show Increase

Labor Demands 15 Per Cent Advance in Wages—Steel
Production Still Large

BERLIN, GERMANY, Sept. 27.—The Metal Workers' Labor Union claims that producers have reaped large

profits from their advances of domestic and export prices in January and May and is demanding an increase in

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works with American equivalent figured at \$4.86 per £ as follows:

Durham coke, del'd.....	£0 17½s. to £0 17¾s.	\$4.25 to \$4.31
Bilbao Rubio ore.....	1 2 to 1 2½	5.35 to 5.48
Cleveland No. 1 fdy.....	3 8½ to 3 9½	16.64 to 16.89
Cleveland No. 3 fdy.....	3 6	16.04

ness. Exports of pig iron in the first half of this year were only 13 per cent of the total sales of the Pig Iron Syndicate, compared with 16 per cent in the first half of 1927 and 31 per cent in the same period of 1926.

Expectation of a rise in the steel prices has brought out considerable buying, and mills are in most cases booked for six to eight weeks in advance. The proportion of foreign to domestic steel orders is increasing. The decline in steel output from the high rate of 1927, when production exceeded 1926 by 4,000,000 tons, has been extremely small. The average output per working day in the first eight months of this year was 51,500 metric tons, compared with 52,900 tons in the same months of 1927. In rolled products, the average output per working day this year has been 40,800 tons compared with 41,700 tons in 1927.

At the recent meeting of the European Rail Makers' Association prices were advanced 2s. 6d. (61c.) per ton. Renewal of the association agreement, which expires March 31, 1929, will be discussed in December. The medium and heavy sheet association agreement has been renewed until Dec. 31, and the present base price on sheets of 165 m. (\$39.27) per ton, f.o.b. Essen, has been retained. Efforts are being made to replace the present loose agreement of sheet producers with a syndicate, and it is understood that the 18 mills have agreed to quota participation. Of a total output of 207,435 metric tons of sheets, the following quotas are suggested as a basis for the syndicate: Mitteldeutsche

Stahlwerke, 54,850 tons; Vereinigte Stahlwerke, 29,041 tons; Heinrichshuette 21,252 tons, and Gutehoffnungshuette 19,452 tons.

At the recent meeting of the International Tube Cartel, members were unable to reach an agreement on an increase in tube prices. Great Britain is not expected to join the cartel until the British Government has established a tariff on tubes. At present the chief members are Germany, with a quota of about 60 per cent, France and Belgium, with 26 per cent, and Czechoslovakia, with 11 per cent.

Stockholders of the Mannesmann Tube Corporation have voted to increase the capital stock by 25,000,000 m. (\$5,950,000) to 165,000,000 m. (\$39,270,000). The new capital is to be used to develop the company's works at Huckingen, on the Rhine River, between Düsseldorf and Duisburg. It is planned to produce more raw material, needed by the tube mills; pig iron output will be expanded to about 600,000 tons annually.

Exports of machinery have gained. German manufacturers are making rapid progress in sales of machinery to Eastern Europe. Domestic demand for agricultural implements is expected to be large this year, as crops have been good, the yield of cereals being estimated at 10 to 11 per cent greater than in 1927. Exports of agricultural machinery to Russia, however, have declined considerably. Russian purchases of textile machinery and machine tools are about 12 times those of 1925, and of miscellaneous machinery, about five times.

being put on the ways is small and heavy plate mills continue in need of orders.

The agreement recently reached between the United States and Welsh tin plate makers for the regulation of sales to certain export markets has provoked some criticism, although the plan as a whole has been received favorably by the Welsh trade. It is reported that similar negotiations are pending between Wales and Germany, but at present no definite information is available. The tin plate trade is in a sound condition, and Welsh makers are assured of steady operations for some months.

Shortage of Fuel and Ore Limits Japan's Future in Steel

WASHINGTON, Oct. 11.—Difficulty in obtaining satisfactory coke at a reasonable price is the outstanding problem of the Japanese iron and steel industry, according to J. H. Ehlers, assistant commercial attaché, in a bulletin issued by the Department of Commerce. Japan has an abundance of coal, but not of a type producing good coke. With blast furnace coke at more than 15 yen (\$6.87) per ton, it is difficult to see, Mr. Ehlers states, how pig iron can be economically produced, unless great savings are effected in labor or other costs.

The iron mines of Japan proper produce but a small proportion of the total ore consumption of the country. In 1927, Japan, Chosen and South Manchuria produced 1,212,000 tons of ore, of which only 159,000 tons came from mines in Japan. The production of South Manchuria was half the total although its ores are of much lower iron content than the others.

Besides imports of ore from Japanese controlled territory, large quantities are brought in each year from the Yangtze Valley in Central China and from the Malay States. The mines in both these areas are controlled by Japanese interests. Little ore, according to Mr. Ehlers, is imported from sources not controlled by Japanese capital. The thoroughness with which sources of supply from Asiatic ore properties have been built up is shown by the growth of iron ore imports, which have nearly quadrupled in the past 16 years. The Japanese have increased the production in all the areas which they control and have been able to insure an increasing supply, despite fluctuations in the flow from certain individual sources.

While sufficient for its iron and steel industry as it now exists, Japan's ore reserves are insignificant when compared with those of the large iron and steel producing countries of the world. Reserves in Japan proper and Chosen amount to about 100,000,000 tons, while South Manchuria has about 750,000,000 tons. These figures compare with 10,000,000,000 tons of high-grade ore in the United States, about 8,000,000,000 tons in France and 1,000,000,000 tons in Germany.

Tariff Protection Nearer in Britain

Mills Rolling Foreign Steel Would Be Affected—Welsh Tin Plate Makers May Negotiate with Germany

LONDON, ENGLAND, Sept. 29.—Interest in the iron and steel trade is now centered in the possible introduction of "safeguarding" by the Government. It has been known for some time past that the Premier was being pressed by certain Conservative members to apply this measure to the iron and steel trade, but it was thought that he would refuse. At the Conservative conference at Yarmouth this week, however, Mr. Baldwin announced that no industry would be prevented from applying for protection, which means that the case for safeguarding will be considerably strengthened. The value of such a measure seems to be an open question. It is regarded as certain that one of the largest industries of the country, rolling mills using foreign semi-finished steel, would be seriously affected, and the trade in galvanized sheets would be jeopardized. Meanwhile, although fall business should be developing, there is no indication of any substantial improvement in iron and steel orders.

A factor that is likely to have an important bearing on market conditions is the continued firmness of Continental markets, which has sharply restricted imports of steel into this country to a large extent. But it is export business that is required, and because of the lack of it, makers' order books are far from well filled. Pig iron producers in the Cleveland district are moderately busy and are able to dispose fully of their restricted output, but in other districts there are still substantial stocks. A few sales for export are recorded, but the demand is not strong and competition is keen. Continental pig iron is no longer coming into this country for consumption here, as the price is not competitive, and it is reported from the Continent that the domestic demand there is fully able to absorb output.

In the finished steel market, British consumers of construction and engineering material are supplying mills with a fair volume of work, but the tonnage of new shipbuilding that is

Foreign Steel Deliveries Extended

Mills Ask Several Months' Delay—Exporters Foresee Lower Delivered Price on Tin Plate from New California Mill

NEW YORK, Oct. 16.—Importers of European steel are still offering small lots of certain sizes of shapes, most of which they purchased some time ago at prices below the present Continental market. Recent quotations by European mills have ranged from 1.75c. to 1.85c. per lb., base, on shapes and from 1.95c. to 2c. per lb., base, on plain steel bars of ordinary Thomas grade. In addition, deliveries are becoming more extended and some foreign mills are unwilling to accept new business except for delivery at their convenience, which might mean several months' delay.

Export trade continues small, particularly with the Far East, most current inquiries being for small lots of tin plate and certain specialties. Demand for second-hand plates from China has declined considerably in recent weeks, and the explanation of Chinese importers is the cessation of

hostilities. When warfare was active, such plates were used for street barricades, and were placed against windows and even the walls of rooms to make them bullet-proof. In some small communities, according to the importers, a single building would be barricaded with plates to afford protection to the women and children.

The new tin plate plant that the Columbia Steel Corporation plans to erect at Pittsburg, Cal., has aroused interest among exporters to the Far East. In addition to affording earlier delivery of tin plate to Japanese and Chinese merchants and consumers, the plant will have lower ocean freight rates, which may reduce the delivered price by 15c. to 20c. per base box. The ocean freight rate to Japan from Atlantic ports is \$8 per gross ton or about 36c. per 100 lb., compared with a rate from San Francisco of \$4 per net ton, or 20c. per 100 lb.

Large Increase in Fluorspar Imports

Foreign Product Sold in United States in 1927 Equal to 64 Per Cent of Domestic Shipments

WASHINGTON, Oct. 16.—In a pamphlet just issued by the Bureau of Mines, it is pointed out that salient features of the fluorspar industry in 1927 were the decrease in domestic shipments; the pronounced increase in imports from Germany and the equally pronounced decrease in imports from the United Kingdom; the large stocks of fluorspar at consumers' plants on Dec. 31, especially the stocks of 85,000 net tons that accumulated at basic open-hearth steel plants; and the increase in producers' stock piles, which were the largest ever accumulated.

Shipments of fluorspar to steel plants by domestic producers in 1927 were 12 per cent less than in 1926 and there were also decreases of 27 and 21 per cent, respectively, in the shipments of fluorspar for use in foundries and glass plants. Exports in 1927 were the smallest since 1921. In 1927, shipments of fluorspar from domestic mines aggregated 112,546 net tons, valued at \$2,034,728 or a decrease of 13 per cent in both quantity and value as compared with 1926. The general average value per ton f.o.b. mines or shipping points for all grades in 1927 was \$18.08, which is 12c. lower than the average in 1926. Of the total shipments last year, 97,036 tons was gravel fluorspar, valued at \$1,599,310 or \$16.48 per ton at the mines, comparing with 112,092 tons, valued at \$1,868,854, or \$16.67 per ton in 1926.

Of the 1927 output of gravel spar, Kentucky mines supplied 50,533 tons, valued at \$839,933, or \$16.62 per ton,

as against 38,970 tons, valued at \$656,863, or \$16.86 per ton, produced in Illinois mines. Colorado produced 5971 tons and New Mexico 1562 tons. Steel plants in 1927 received 93,196 tons or 82.81 per cent of the production, the average value being \$16.35 per ton at the mines, against 105,614 tons or 82.09 per cent of the 1926 output, with an average value of \$16.51 per ton. Exports in 1927 amounted to only 385 tons, compared with 2132 tons in 1926.

Imports of fluorspar in 1927 amounted to 71,515 tons, valued at \$595,185, and were the second largest ever recorded, having been exceeded only in 1926, when imports were 75,671 tons, valued at \$747,237. The value assigned to the foreign fluorspar in 1927 averaged \$8.32. The cost to consumers in the United States includes, in addition to the duty of \$5 per net ton, loading charges at the docks, the ocean freight charges, and other charges, besides the freight charges from docks to manufacturers' plants. The imports were equivalent to 64 per cent of the total shipments of domestic fluorspar in 1927 compared with 59 per cent in 1926. It is estimated that steel plants consumed 62,115 tons of imported ore in 1927.

According to reports of importers of 44,185 tons of imported fluorspar sold to steel manufacturers in 1927, the selling price of this quantity at tidewater, duty paid, ranged from \$15.71 to \$17.81 and averaged about \$16.47 per ton. The United Kingdom, which has been the chief source of imported fluorspar, supplied only 26

per cent of the total imported in 1927, the imports of 18,449 tons representing a decrease of 37 per cent from 1926. Germany was the chief source of fluorspar imports last year, supplying 31,829 tons or 45 per cent of the total, against 36 per cent of the 1926 total.

In 1927, 138,000 tons of fluorspar was consumed in basic open-hearth furnaces, and at the end of the year these furnaces had stocks aggregating 85,000 tons, the largest on record. In 1926, they consumed 142,000 tons and at the end of the year had 70,000 tons in stock. The average quantity of fluorspar used by individual plants per ton of basic open-hearth steel, the report said, varies widely, usually ranging from 1 to 35 lb. In general, the average is stated to be between 7 and 8 lb.

Fluorspar Duty Report Is Referred to Departments

WASHINGTON, Oct. 16.—It was stated at the White House last Friday that the fluorspar report sent to the President by the Tariff Commission will be sent to the Department of Commerce and then to the Treasury Department before action is taken on it by the President. This is the usual procedure of such reports. The Tariff Commission is said to have recommended that the existing duty of \$5 per net ton be increased 50 per cent to \$7.50, though the report cannot be verified. The increased duty was asked by domestic producers of fluorspar, while the application was opposed by Eastern steel makers, particularly the Bethlehem Steel Co.

Australian Steel Works to Build Coke Plant

WASHINGTON, Oct. 16.—Development and expansion of the Newcastle steel works of the Broken Hill Proprietary Co. will entail an initial cost of £1,000,000 and for the present will be confined to the erection of a by-product coke plant, according to a report received from Trade Commissioner E. C. Squire, Sydney. The equipment is to be of the Coppee type. It is understood that the Coppee company proposes to use the largest possible proportion of Australian material and workmen in the construction of the plant, importing from England only those special materials and skilled technicians not obtainable locally. In some quarters the proposed expansion is taken to indicate the inauguration of a plan to meet competition expected from the newly organized Australian Iron & Steel, Ltd., which is engaged in building steel works at Port Kembla, and also expected from a new German company, which is reported to be preparing to set up a plant at Cessnock, New South Wales, for the production of coal products.

Export Rebates Gain in Favor

German System of Supplying Cheaper Steel to Manufacturers Who Sell Products Abroad May Be Adopted by Other Countries

HAMBURG, GERMANY, Sept. 30.—The success that has attended the German plan of paying rebates on steel bought by manufacturers in Germany who export their products is evidently influencing other European producing countries to adopt similar measures. Application of such a system appears to be desirable for any country with a tariff on steel. Success of the rebate plan in Germany is measured by its advocates in the constantly rising exports of manufactured metal products, such as machinery, bolts, nuts, rivets, wire and general hardware. The non-ferrous metal industry in Germany has adopted a similar plan, and in other lines, such as artificial silk, glass and pottery, steps are being taken to establish rebates on the raw materials entering exported products.

As France, Belgium, the Saar, Austria, Poland and Czechoslovakia have steel tariff schedules, it is considered probable that rebate plans will eventually be introduced in all these producing countries. Austria has already applied a system of rebates patterned after the German plan, and Czechoslovakian mills are expected to reach an agreement with exporting consumers before the end of the year. In France, the Comité des Forges is negotiating with the French steel consumers to the same end, and Belgian manufacturers of bolts, rivets, wire

and machinery are urging the introduction of such a system.

Advocates of a rebate plan point out that a high domestic steel market is a distinct disadvantage to the manufacturer for export, who must meet the competition of foreign makers of the same product who buy exported steel at considerably lower prices. The example of a German manufacturer of bolts at Hagen and a Dutch competitor at Helmond is cited. Both bolt makers may buy their raw material from a mill at Hagen. In the case of the Dutch producer the price is £6 2s. 6d. (\$29.77) per metric ton, to which is added 8 m. (\$1.90) per ton for bolt quality. The German maker would pay 150 m. (\$35.70) per ton, or \$4.03 per ton more than his competitor were it not for the rebate. A British maker of wire or wire nails may buy German wire rods at £6 (\$29.16) per ton, while the German manufacturer buying from the same plant, without the rebate, would pay 159 m. (\$37.84) per ton. It is claimed that in producing countries where no rebates are paid to exporting manufacturers the producer for export finds it necessary to buy abroad, as he receives a return of the greater part of the duty when the manufactured article is exported. This is to the disadvantage of the producers of that country as well as the consumers.

Direct Process Plant Under Construction in Germany

Construction of an experimental plant in Germany by the Friedrich Krupp A. G. and the Vereinigte Stahlwerke A. G., for the purpose of testing the "Norsk-Staal" method of making sponge iron and steel direct from ore (THE IRON AGE, Oct. 4, page 835), has been started, according to a report to the Department of Commerce from the trade commissioner in Berlin. The two corporations cooperating in this experimental work are understood to have been working independently on various processes for some time and finally decided to develop the "Norsk-Staal" method, by which steel is produced at low temperatures with gas. In this process, the iron does not become fluid and the finished product is of a spongy consistency.

It is said that the consumption of gas is not excessive, as it is used repeatedly for reducing the ore. Although a large quantity of electric current is required in converting the sponge iron into steel, it is believed that this can be produced at low cost by using by-product gas.

The annual production at the experimental plant will be about 20,000

tons, and it is said to be the first large experimental venture of the kind in Germany. Other methods, such as that used by the Hoesch Iron & Steel Co., have been employed on a much smaller scale.

German Cities Contract for Steel Dwellings

HAMBURG, GERMANY, Sept. 30.—Rapid progress is being made in steel house construction. Contracts for from 30 to 100 steel dwellings have been awarded by the cities of Munich, Frankfurt, Breslau, Oppeln and Berlin. At present, orders for single houses for individuals cannot be accepted, as output falls considerably short of demand.

Russian Iron and Steel Output Greater Than Year Ago

Russian industrial output in July decreased 9.3 per cent from June, according to preliminary returns of the Supreme Economic Council of the U. S. S. R. Compared with July of last year, however, industrial production showed an increase of 27.1 per cent. In the first 10 months of the

fiscal year, gross industrial output increased 22.2 per cent, compared with the same period of the previous year.

Production of pig iron in July was 268,700 tons, compared with 245,200 tons in July, 1927; steel ingot output was 310,500 tons compared with 284,300 tons, and production of rolled metals was 232,300 tons, compared with 189,100 tons.

New German Company to Sell Ship Steel

HAMBURG, GERMANY, Sept. 30.—A ship steel sales office has been established by the United Steel Works, Düsseldorf, in conjunction with other producers. Both export and domestic business will be handled by the new office, operating as the Schiffbaustahl Verkaufsgemeinschaft G.m.b.H. It is understood that the company may establish some foreign offices.

Turkey Now a Market for Typewriters

HAMBURG, GERMANY, Sept. 30.—Legislation in Turkey compelling the use of Latin letters instead of Arabic has resulted in a considerable demand for typewriters. German and British manufacturers have sent a large number of typewriters to the Government and to schools for free use to introduce their products.

Scrap Dealers Organize in New England

A Southern New England chapter of the Institute of Scrap Iron and Steel, the headquarters of which are at 11 West Forty-second Street, New York, was organized at a meeting of dealers in Hartford, Conn., Oct. 10. Officers elected were Harry S. Blumenthal, Swissman & Blumenthal, Hartford, president; Nathan Katz, Jacob A. Katz & Sons, Hartford, first vice-president; Robert Erlich, Moses Erlich Iron & Metal Co., Springfield, Mass., second vice-president; Harris Botwinick, Harris Iron & Metal Co., New Haven, treasurer; H. Kasden, H. Kasden & Son, New Haven; J. A. Marson, J. A. Marson, Inc., Bridgeport, Conn., and Barney Carlson, Springfield, Mass., members of the executive committee.

This is the third chapter of the institute organized recently, others being the New York and Philadelphia chapters. A dinner meeting of dealers in the Baltimore district is scheduled for Oct. 16 at the Southern Hotel, Baltimore, and a meeting, Oct. 23, at the Berkshire Hotel, Reading, Pa., is expected to be attended by dealers in Reading, Allentown, Bethlehem, Coatesville, Easton, Harrisburg, Lancaster, Lebanon, Pottstown, Pottsville, and York, Pa. Iron and steel scrap dealers of Trenton, N. J., will meet at the Stacy-Trent Hotel, Oct. 17, to consider organization of a local chapter.

Machinery Markets and News of the Works

Machine Tool Orders Large

Tractor Manufacturers and Automobile Companies Buy—
Norfolk & Western Wants Nearly 60 Tools

HEAVY purchasing by tractor manufacturers in the Middle West, considerable business from automobile companies and a generally sustained and diversified demand for single tools were features of machine tool buying during the week. An inquiry from the Norfolk & Western for nearly 60 machines gave new interest to the railroad branch of the market, which has been unusually dull throughout the year.

The Allis-Chalmers Mfg. Co. placed large orders for tools for its Springfield, Ill., tractor plant and the International Harvester Co. bought heavily for its works at Rock Island, Ill.

Much of the business in the Cincinnati, Cleveland and Detroit districts is coming from automobile manufacturers, especially from those putting out new models. Some companies in the Cincinnati district report that fully half of their orders in the week were from the automotive industry. The Olds Motor Works, Lansing, Mich., ordered 10 multiple and double spindle drilling machines. The Mullins Mfg. Co., Salem, Ohio, bought about \$125,000 worth of presses.

The list of the Norfolk & Western consists of a miscellaneous lot of shop equipment. Other roads are inquiring sparingly.

Pending orders for machine tools

are of substantial volume, and indicate that large purchases of shop equipment will continue during the next 30 days at least. Production schedules are taxing the capacity of many machine tools plants. Large unfilled orders make it impossible, in some instances, for tool builders to promise early deliveries.

The National Machine Tool Builders' Association, in its report for September, says that the machine tool orders index continues its upward trend. For the nine months of this year, each month's orders have been above 200 on the association's scale (the figure 100 representing the average shipments for 1922, 1923 and 1924). The base figure of 265 for September was the highest month since March, 1920, which registered 322.3.

"All important factors," says the association, "point to good business for the rest of the year. The metal-working industries have been studying costs and have been making enough money to buy modern equipment to replace old equipment of less efficiency."

Despite the excellence of the general situation, the association sounds a note of caution in saying that "a well known characteristic of machine tool demand is to have some pretty sharp peaks followed by sharp drops."

New York

NEW YORK, Oct. 16.—Machine-tool trade in the Eastern territory continues steady and in fairly good volume but without important feature. Some sellers report business as somewhat quieter, but on the whole there is no complaint.

Niles-Bement-Pond Co. has sold a 62-in. boring mill, a floor boring machine, four Boye & Emmes lathes, Blount speed lathe, United States pedestal grinder, two

Grand Rapids grinders, Niles-Acme 36-in. shaper, and Morris 4-ft. radial drill; Pratt & Whitney division sold two automatic lathes, an engine lathe, two vertical surface grinders, two vertical shapers, eight multiple spindle drills and a jig borer.

Plans are being drawn by Manhattan Refrigerating Co., 521 West Street, New York, for addition to cost about \$100,000 with machinery. Gunvald Aus Co., 244 Madison Avenue, is engineer. T. A. Adams is head.

Dock Department, Pier A, North River, New York, Michael Cosgrove, dock com-

missioner, is planning an appropriation of \$2,750,000 for municipal airport on Barren Island, to be known as Floyd Bennett Field, including \$198,000 for hangars at land plane base; \$66,000 for hangar at seaplane base; terminal buildings at seaplane base, \$20,000; machine tools, \$15,000; wire fencing, \$35,000; water supply system, \$25,000; radio equipment, \$50,000, and electric light and power equipment, \$58,000.

Sinclair Refining Co., 45 Nassau Street, New York, has awarded general contract to Fisher Williams Corporation, 103 Park Avenue, for one-story oil storage and distributing plant at Brooklyn, to cost about \$70,000 with equipment.

Interborough News Co., 244 West Forty-second Street, New York, is having plans drawn for a six-story automobile service, repair and garage building for company motor trucks and cars, to cost about \$180,000 with equipment. Russell G. Cory, 30 Church Street, is architect and engineer.

Charles H. Wilson, 383 Concord Avenue, New York, manufacturer of pyrometers, instrument parts, etc., has filed plans for an addition to four-story factory, including improvements in present structure, to cost about \$35,000.

Pelham Manor School Board, Pelham Manor, N. Y., is said to be planning installation of manual training equipment in three-story addition to high school to cost about \$500,000. Hart & Shape, 247 Park Avenue, New York, is architect.

Frank J. Ricker, 1328 Broadway, New York, architect, has plans for a two-story automobile service, repair and garage building, to cost about \$155,000 with equipment.

Moth Aircraft Corporation, New York, care of J. A. Ritchie & Co., 52 Wall Street, New York, bankers, recently formed under Delaware laws, plans operation of plant in this vicinity for manufacture of D. H. Moth type of airplanes, including parts and assembling, controlled by De Havilland & Co., London, England, with which exclusive contract has been made for production and sale of such aircraft in United States. Company is arranging for early stock offering to provide financing for operations. Minton M. Warren is head.

I. Rokeach & Son, Inc., 345 Hewes Street, Brooklyn, manufacturer of soaps, etc., has filed plans for four-story unit, 90 x 200 ft., to cost over \$125,000 with equipment. C. G. Preis is company engineer.

Liberty Auto Radiator Co., Jersey City, N. J., care of Flagg & Stades, 665 Newark Avenue, architects, has plans for a new two-story unit, to cost \$30,000 with equipment.

Smith Tool & Mfg. Co., 120 Christie Street, Newark, N. J., has plans for a new one-story plant, 90 x 100 ft., to cost about \$25,000 with equipment.

J. D. Lugosch, 714 Bergenline Avenue, Union City, N. J., architect, has plans for a one-story automobile service, repair and garage building, 155 x 200 ft., at Pater-

The Crane Market

INQUIRIES for overhead and locomotive cranes continue to accumulate, but prospective buyers are slow to place orders. In overhead cranes there is a fair volume of inquiry for hand power equipment and electric cranes of small capacity. Chicago, Rock Island & Pacific will buy two 15-ton overhead electric cranes with auxiliary hoods for delivery at Burr Oak, Ill. Issue of the list of overhead equipment for the new 207th Street yards of the Transit Commission,

New York, is not expected until early next year. The list of locomotive cranes and steam shovels inquired for by Dwight P. Robinson & Co., New York, for use in Argentina, has been awarded to two large builders, one in Ohio and the other in Wisconsin.

Among recent purchases are:

Dwight P. Robinson & Co., New York, seven 10-ton crawl-tread cranes and four 5-ton truck cranes from a Wisconsin builder and two steam shovels from the

Bucyrus-Erie Co., all for shipment to a contract at Buenos Aires, Argentina.

Panama Canal Commission, Washington, 30-ton steam-driven locomotive crane for use at Panama Canal, from Brown-Ing Crane Co.

Algoma Power Co. of Canada, 45-ton overhead electric crane from Northern Engineering Works.

Power Corporation of New York, Watertown, N. Y., 30-ton, one-motor crane from Northern Engineering Works.

son, N. J., to cost about \$140,000 with equipment.

Public Service Electric & Gas Co., Public Service Terminal Building, Newark, N. J., has plans for a two-story equipment storage and distributing plant, 140 x 180 ft., with shop facilities, at Jersey City, N. J., to cost over \$200,000 with equipment.

Lackawanna Railroad Co., 90 West Street, New York, is asking bids until Oct. 30 for one and eight-story storage and distributing building, 343 x 410 ft., at Jersey City, N. J., forming first unit of new terminal project, to cost over \$1,500,000 including mechanical handling and other equipment. G. J. Ray is company engineer.

Brooklyn Ash Removal Co., Inc., office of Department of Street Cleaning, Municipal Building, New York, is asking bids until Oct. 29 for furnaces, air-preheaters, flues and other equipment for three incinerator plants, each with burning capacity of 500 tons per 24 hr., at Brooklyn. Plans and specifications at office noted. Erle L. Collins is chief engineer.

Koeppen Metal Products, Inc., formerly at Union City, N. J., is now located in new plant at Carlstadt, N. J., and may be addressed at P. O. Box 37.

New York Steam Corporation, New York, has let contract for nine-story warehouse, 46 x 100 ft., foot of East Thirty-sixth Street, New York, to Turner Construction Co., 420 Lexington Avenue, New York. G. Denison is engineer.

Bell Telephone Laboratories, Inc., New York, has let contract for new three-story laboratory in Bank Street, 50 x 120 ft., to Turner Construction Co., 420 Lexington Avenue, New York. Voorhees, Melin & Walker are architects.

Accurate Fireproof Door Corporation, 425 Barretto Street, New York, has been organized to manufacture fireproof doors, window sash and other fireproof products. Operations will begin about Oct. 22.

New England

BOSTON, Oct. 15.—Contract has been let by United States Rubber Co., 1790 Broadway, New York, to Berlin Construction Co., Berlin, Conn., for one-story addition to plant at Naugatuck, Conn., to cost about \$32,000.

Municipal Light and Power Department, Hudson, Mass., will make extensions and improvements in electric light and power plant, including addition and installation of new equipment, to cost more than \$40,000. L. D. Wood is manager.

Enterprise Mfg. Co., Cambridge, Mass., manufacturer of hot water boilers, copper vessels and other coppersmithing, has

arranged for removal of plant on First Street to one of former factory buildings of Blake & Knowles Pump Co., at Third and Binney Streets, for increased production.

Brockton Gas Light Co., Main Street, Brockton, Mass., has asked bids on general contract for one-story automobile service and mechanical repair shop, 125 x 125 ft., to cost over \$75,000 with equipment. C. H. Tenney Co., 200 Devonshire Street, Boston, is engineer.

Panco Rubber Co., Chelsea, Mass., has awarded general contract to Idell Melnick, Chelsea, for one-story addition to press department, 48 x 100 ft., to cost over \$35,000 with equipment. Schein & Levine, 20 Pemberton Square, Chelsea, are architects.

Texas Co., 31 St. James Street, Boston, is planning two-story addition, 40 x 145 ft., to oil storage and distributing plant at Chelsea, to cost about \$75,000 with equipment. Headquarters are at 17 Battery Place, New York.

New Britain Iron & Construction Co., New Britain, Conn., ornamental and other iron products, has removed its plant from 189 Hartford Avenue to 1283 East Street, where increased production will be carried out.

Kepes & Sattan Co., Parsons Street, Wallingford, Conn., has been organized to manufacture wood handles for screw drivers and similar tools. Factory has been acquired and equipment installed. Company is in market for shavings and dust collector.

Pittsburgh

PITTSBURGH, Oct. 15.—While machine-tool business is not so active as many might wish, there is little real cause for complaint either as to sales or inquiries. Some good business is expected from the Westinghouse Electric & Mfg. Co. which has not yet begun to buy extensively on its fourth quarter list. Another prospect is the Aluminum Co. of America, in connection with expansions at Massena, N. Y., and New Kensington, Pa., while the Pittsburgh Plate Glass Co. is a probable buyer for its new plant at Crystal City, Mo.

Wheel foundry of Pressed Steel Car Co., McKees Rocks, Pa., which has lately been idle, was destroyed by fire Oct. 9. Considerable machinery was lost. H. P. Hoffstot is vice-president and C. W. Wrenshall, general manager.

Property, 48 x 460 ft., for expansion, has been acquired by Pittsburgh Foundry & Machine Co., foot of Thirty-sixth Street, Pittsburgh.

Ovens, power equipment, conveying and

other machinery will be installed in new two-story and basement baking plant to be built by Fishels Co., 233 Fifth Avenue, Pittsburgh, 100 x 240 ft., to cost over \$250,000. Richard Irvin & Co., Vandergrift Building, are architects.

Oil Well Supply Co., 215 Water Street, Pittsburgh, has leased building totaling about 10,000 sq. ft. floor space, for extensions in storage and distributing plant.

Board of Education, Lewistown, Pa., is said to be planning installation of manual training equipment in two-story junior high school to cost \$150,000, for which bids have been asked on general contract. Hersh & Shollar, Commerce Building, Altoona, Pa., are architects.

West Virginia Water Service Co., Bluefield, W. Va., plans extensions and improvements in plant and system, including construction of dam at Ada, W. Va., and installation of pumping and other equipment, to cost over \$150,000.

South Atlantic

BALTIMORE, Oct. 15.—Independent Can Co., Baltimore, care of Edwin A. Parker, head of Parker Metal Decorating Co., Howard and Ostend Streets, recently formed by Mr. Parker and associates with capital of \$1,000,000, is said to be planning construction of new works, to cost more than \$200,000 with equipment.

Crown Cork & Seal Co., 1511 Guilford Avenue, Baltimore, manufacturer of metal bottle caps, bottle-capping machinery and parts, has asked bids on general contract for one and two-story addition, 150 x 600 ft., to cost over \$175,000 with equipment. L. R. White, Hearst Tower Building, is architect.

Storms Aviation Co., Spartanburg, S. C., recently formed by N. E. Storms, Spartanburg, and associates, will operate an airplane and parts manufacturing works near municipal airport, where buildings have been secured, including machine shop and hangar.

Gulf Refining Co., Sydenham and Locust Streets, Philadelphia, is said to be planning construction of new oil storage and distributing plant at Siler City, N. C., to cost about \$40,000 with equipment.

Perel's Fixture Exchange, 241 Harrison Street, Baltimore, store and office fixtures and equipment, has awarded general contract to Abraham Goodman, 2000 Whittier Avenue, for a three-story addition, 54 x 65 ft., to cost about \$35,000. John Freund, 1307 St. Paul Street, is architect.

Board of Education, Easton, Md., is said to be planning installation of manual training department in new high school to cost more than \$200,000, for which bids are being asked on general contract until Oct. 23. Henry P. Hopkins, 347 North Charles Street, Baltimore, is architect.

Following merger of John H. Heald Co., Lower Basin, Lynchburg, Va., manufacturer of extracts, etc., and Mead Paper Board Corporation, Dayton, Ohio, last-noted company is reported planning a new paper mill near Lynchburg, to cost over \$200,000 with equipment.

Covington Machine Co., Covington, Va., E. H. Archer, manager, is planning installation of equipment to manufacture expanded metal lath.

Delco Light Co., Dayton, Ohio, a subsidiary of General Motors Corporation, manufacturer of isolated electric lighting plants, is planning new factory branch and distributing plant at Charlotte, N. C., to cost over \$50,000 with equipment.

Chesapeake & Ohio Railroad Co., Richmond, Va., has completed plans for new engine house, machine shop, blacksmith and forge shop, pipe shop and other units, at Huntington, W. Va., to cost more than \$2,000,000 with equipment.

Philadelphia

PHILADELPHIA, Oct. 15.—Davies Battery & Electric Co., 2016 South Bancroft Street, Philadelphia, has purchased two-story building at 2021-27 South Chadwick Street, 52 x 88 ft., for expansion.

Huck-Gerhardt Co., Inc., Luzerne and G Streets, Philadelphia, is having plans revised for two-story addition to millwork plant, to cost about \$40,000 with equipment. Clarence E. Wunder, 1520 Locust Street, is architect.

Atwater Kent Mfg. Co., Wissahickon Avenue and Abbotsford Road, Philadelphia, manufacturer of radio equipment, has taken title to seven acres adjoining plant, and will expand building program, announced in these columns last week, to include one-story units, to cost more than \$900,000 with equipment. Ballinger Co., Twelfth and Chestnut Streets, is architect and engineer.

Central Airport, Inc., Philadelphia, recently organized by C. Townsend Ludington, president Ludington Philadelphia Flying Service, Inc., Island Road and Tinicum Avenue, and associates, has acquired 145 acres at Camden, N. J., and plans construction of airport, including hangars, machine and repair shops and other units. Company is disposing of stock issue to total \$550,000, a considerable portion of fund to be used for airport construction.

Officials of American Brown-Boveri Electric Corporation, 420 Lexington Avenue, New York, have organized a subsidiary, New York Shipbuilding Co., to take over and operate this branch of its properties at Camden, N. J. Parent company will continue to occupy portion of plant, as heretofore, for manufacture of heavy electrical machinery. Both branches of business will be developed for increased output. C. L. Bardo is president of subsidiary organization.

Quality Alloy Casting Co., Easton, Pa., has been organized by T. A. Mellon, 205 First National Bank Building, and associates, to operate plant for manufacture of aluminum, brass, bronze and other metal castings, as well as for production of hardware specialties. J. Clem Kline, R. F. D. No. 3, Easton, is interested in new company.

Delaware School Foundation, duPont Building, Wilmington, Del., is said to be planning installation of manual training equipment in new two-story high school at Newcastle to cost more than \$350,000,

for which plans are being drawn by Guilbert & Bételle, 20 Branford Place, Newark, N. J., architects.

Hazlebrook Coal Co., Mount Carmel, Pa., is said to be planning construction of new electrically-operated coal breaker at its Mid-Valley colliery, near Mount Carmel, to cost more than \$500,000 with machinery.

William Costello Co., Inc., 2536 North Third Street, Philadelphia, has been formed to continue business of former William Costello Co. in manufacture, repair and sales of machinery, machine tools and other equipment. Business is confined largely to biscuit and cake-making machinery.

Glasgow Iron Co., formerly in Harrison Building, Philadelphia, has removed office to Pottstown, Pa.

Harrisburg Foundry & Machine Co., Inc., Harrisburg, Pa., has been formed to succeed Harrisburg Foundry & Machine Works, recently in receivership. New company will continue manufacture of gray iron castings, Harrisburg dual clearance unafow engine, Harrisburg single valve and Corliss valve engines. C. W. Lynch, who operated company prior to 1920, will be president.

Carpenter Steel Co., Reading, Pa., plans rebuilding plant, including 9-in. and 10-in. rolling mills, wire mill and other units, partly destroyed by fire Oct. 6.

Buffalo

BUFFALO, Oct. 15.—Contract has been let by National Grinding Wheel Co., 2984 Main Street, Buffalo, to L. A. Harding, 1335 Main Street, for new plant at North Tonawanda, N. Y., to cost more than \$50,000 with equipment.

Eisler Mfg. Co., 15 Eisler Terrace, Rochester, N. Y., manufacturer of special tools, has changed its name to Yawman Metal Products, and has increased capital to provide for expansion.

Curtiss Aeroplane & Motor Co., Kail Street, Buffalo, is said to be arranging call for bids for initial units of plant on property recently acquired at Tonawanda, N. Y., consisting of four one-story units, 200 x 1500 ft., 200 x 200 ft., 60 x 200 ft., and 60 x 100 ft., to cost about \$750,000 with equipment.

New York Central Railroad Co., Buffalo, and 466 Lexington Avenue, New York, has plans for new one and two-story car repair shop at East Buffalo yards, to cost over \$65,000 with equipment.

George F. Johnson, head of Endicott-Johnson Corporation, Binghamton, N. Y., manufacturer of shoes, and associates are organizing a local company to be affiliated with Colonial Airways Corporation, 270 Madison Avenue, New York, which is planning establishment of air line between New York and Buffalo. New company plans construction of airport to serve Binghamton, Johnson City, Endicott and vicinity, with hangars, repair and reconditioning shops and other mechanical units, to cost over \$100,000.

Department of Correction, Albany, N. Y., has authorized construction of new mechanical shop building at Auburn State Prison, Auburn, N. Y., to cost about \$225,000 with equipment.

William G. and Frank D. Menihan, 171 Cedar Street, Corning, N. Y., and associates have organized Corning Saw & Supply Co., with capital of \$50,000, to establish and operate local plant for manufacture of saws, files and other cutting tools. Hugh V. O'Brien, 262 West

Second Street, is also interested in company.

Excavation work on three-story addition, 90 x 500 ft., to plant of Ritter Dental Mfg. Co., West Avenue, Rochester, N. Y., has been begun. Building will be used to house business of Electro Dental Mfg. Co., Philadelphia, purchased by Ritter company early in year and which will be removed to Rochester.

Chicago

CHICAGO, Oct. 15.—Heavy purchases by tractor manufacturers have made the past week one of the most active so far this fall. Allis-Chalmers Mfg. Co. has placed orders for its Springfield, Ill., tractor plant and the International Harvester Co. is closing a large list for its Rock Island works. An appropriation for machine tools has been made by A. O. Smith Corporation, Milwaukee, and it is probable that revised bids will be taken on a list sent out several weeks ago. Machine-tool manufacturers west of Chicago are in the market for miscellaneous equipment.

The Chicago, Milwaukee, St. Paul & Pacific is asking for prices on a 24-in. Gould & Eberhardt shaper, a 2 x 24-in. turret lathe and an 18-in. x 12-ft. selective-head engine lathe. The Chicago Board of Education will buy a 30-in. band saw for the Medill High School.

Norfolk & Western Railroad has issued the following list:

- One No. 6 Brown & Sharpe automatic screw machine, motor driven.
- One 20-in. x 8-ft. motor-driven engine lathe with taper attachment.
- One 48-in. carwheel borer, motor driven.
- One crankpin turning machine.
- One core oven, 8 ft. 6 in. wide, 17 ft. 6 in. deep, 11 ft. 6 in. high.
- Two 20-in. vertical drills, motor driven.
- One Foley saw filing machine.
- One 24 x 6-in. heavy-gear cutting machine, motor driven.
- One internal grinding machine for holes 1 1/2 to 5-in. diameter x 3 to 8 in. deep.
- Eight 8 x 30-in. plain external grinding machines.
- One model D Walker grinding machine.
- One locomotive flue grinder.
- Five 18 x 3-in. motor-driven double floor grinders.
- Five 2 1/2 x 12-in. motor-driven double floor grinders.
- Two 1 x 6-in. motor-driven double floor grinders.
- One 1 x 6-in. motor-driven floor buffer grinder.
- Two 1-ton electric hoists.
- Two 2-ton electric hoists, 20-ft. lift.
- One Rockwell hardness tester.
- One 16 x 8-ft. tool-room lathe, motor-driven.
- Two No. 1-A Warner & Swasey turret lathes.
- One No. 3-A Warner & Swasey turret lathe.
- One heavy-duty axle lathe.
- Two gap axle lathes.
- One 42-in. carwheel turning lathe.
- One 36 x 36-in. x 16-ft. three-head, planer-type milling machine.
- One 24 x 6-in. single surface planer.
- One Tabor hinged roll-over core machine.
- One nibbling machine, motor driven, 24-in. throat.
- One 36-in. heavy-duty open-side planer.
- One Peerless portable hydraulic pinion puller.
- One locomotive-flue roller.
- One motor-driven heavy-duty hack saw.
- One No. 470 Fay & Egan motor-driven scroll saw.
- One 36-in. heavy-duty shaper.
- One 48-in. tinnings' foot-power squaring shear.
- One 12-in. Universal head slotter, head to swivel 15 deg.

Pressed Steel Car Co., 13600 Brainard Street, Chicago, will build a one-story boiler house, 72 x 80 ft.

Chicago, Rock Island & Pacific is building a new car shop, 75 x 500 ft., at Burr Oak, Ill.

A new assembly and storage plant, 220 x 240 ft., and a research and experimental building, 36 x 80 ft., both one story, are under way at plant of Wood Brothers Thresher Co., Des Moines, Iowa, and will represent an investment of \$60,000.

International Harvester Co., 606 South Michigan Avenue, Chicago, has asked bids on general contract for one-story foundry, 160 x 320 ft., and two-story motor truck unit, 90 x 520 ft., at Rock Island, Ill., to cost more than \$600,000 with equipment. W. D. Price is superintendent of construction.

City Council, City Hall, Minneapolis, Minn., has awarded general contract to Standard Construction Co., Plymouth Building, for one-story machine shop and equipment storage and distributing building to cost \$40,000. A. M. Larson, City Hall, is architect.

National Airways Corporation, care of Jameson & Harreson, Peoria Life Building, Peoria, Ill., architects, has plans for new aircraft manufacturing plant at Peoria, where site has been secured on Mount Hawley Road.

Public Service Co. of Colorado, Denver, Colo., will build a new one-story steam-operated electric power plant at Alamosa, Colo., to cost about \$45,000 with equipment. Work will be carried out in connection with expansion program in Alamosa district to cost about \$125,000.

Gulf States

BIRMINGHAM, Oct. 15.—Rome Electric Range Co., Huntsville, Ala., has awarded general contract to George A. Rodgers, Huntsville, for initial unit of new plant, one-story, 50 x 250 ft., including foundry and machine shop.

Bemis Brothers Bag Co., 601 South Fourth Street, St. Louis, has approved plans for power house, 49 x 50 ft., at proposed new mill at Talladega, Ala., with machine shop and other units, project to cost more than \$2,000,000. J. E. Sirrine & Co., Greenville, S. C., are architects and engineers.

Board of Commissioners, City Hall, Mobile, Ala., is asking bids until Oct. 26 for equipment for municipal pumping stations, including four motor and gasoline engine driven horizontal centrifugal pumping units, each with capacity of 5200 gal. per min., with auxiliary equipment. Wright Smith is city engineer.

Weatherford, Mineral Springs & Northwestern Railway Co., Weatherford, Tex., will rebuild part of engine house, tool and equipment shops at Weatherford, recently destroyed by fire.

Ford Motor Co., Detroit, is having plans drawn for a new one-story factory branch, service and repair building, 125 x 170 ft., at Meridian, Miss., to cost about \$60,000 with equipment. P. J. Krouse, M. & W. Building, Meridian, is architect.

Richardson Refining Co., Big Spring, Tex., is erecting new oil refinery with initial capacity of 5000 bbl. per day, to cost about \$750,000 with equipment.

Ouachita Iron Works, Inc., Monroe, La., is planning construction of new foundry,

machine, forge and welding shops, and other units, to cost more than \$60,000 with equipment.

Republic Portland Cement Co., San Antonio, Tex., an interest of Smith Brothers Properties, Inc., 121 Villita Street, will proceed with construction of new cement mill units at Longhorn, near San Antonio. A housing development for employees is included. Project will cost more than \$300,000. Terrell Bartlett Engineers, Inc., Calcasieu Building, is engineer.

Houston Lighting & Power Co., Houston, Tex., has awarded general contract to Don Hall, Cotton Exchange Building, for three-story and basement equipment storage and distributing plant, 100 x 150 ft., including repair department and garage, to cost \$250,000 with equipment. Robert J. Cummings, Bankers' Mortgage Building, is consulting engineer.

Houston Gulf Gas Co., San Antonio, Tex., is planning construction of new natural gas pipe line from Jennings gas field, Zapata County, to Monterey, Mexico, about 140 miles, to cost more than \$650,000 with compressor stations and other equipment.

Texarkana & Fort Smith Railway Co., Texarkana, Tex., operated by Kansas City Southern Railway Co., Kansas City, Mo., is completing plans for new locomotive shops at Dowling, near Port Arthur, Tex., where home site will be developed for employees, to cost more than \$300,000 with equipment.

D. S. Mair Machinery Co., Houston, Tex., has been appointed agent in Texas for Whiting Corporation, Harvey, Ill., to handle Whiting and Swenson lines.

Indiana

INDIANAPOLIS, Oct. 15.—Wheeler-Schebler Carburetor Co., Inc., 1302 Barth Avenue, Indianapolis, has awarded general contract to Schlegel & Roehm, 602 Lexington Avenue, for three one-story plant units, to cost about \$65,000 with equipment. D. A. Bohlen & Son, Majestic Building, are architects.

Delco-Remy Corporation, Anderson, manufacturer of automobile starting and lighting equipment, has approved plans for one-story addition to plant at Dayton, Ohio, 75 x 120 ft., to cost about \$50,000 with equipment. A 15-ton traveling crane will be installed.

Auburn Automobile Co., Auburn, Ind., has plans by Austin Co., Cleveland, for one-story plant unit at Connersville, 80 x 100 ft., to cost about \$80,000 with equipment.

Wayne Pump Co., Fort Wayne, Ind., manufacturer of self-measuring gasoline pumps, tanks, air compressors, etc., has acquired Boyle-Dayton Co., Los Angeles, manufacturer of kindred equipment, and will operate as a Pacific Coast division, changing name to Wayne-Dayton Co. Los Angeles plant will be continued for present line, as well as for assembling of Wayne type pumps for coast distribution, expansion will be carried out.

General Motors Corporation, Detroit, is having plans drawn for a two-story service, repair and parts plant at Indianapolis, to cost about \$150,000, for one of its manufacturing divisions not yet announced. Albert Kahn, Inc., Marquette Building, Detroit, is architect and engineer.

Cleveland

CLEVELAND, Oct. 15.—Machine tool business continues good in single orders which are coming largely from plants affiliated with the automotive industry. Some forging and stamping companies are adding to their tool room equipment. Buyers usually want quick shipments, but a number of manufacturers are slow on deliveries. Not a great deal of business is coming at present from the automotive industry in the Michigan territory, although the Olds Motor Works, Lansing, during the week purchased ten multiple and double-spindle drilling machines.

Other orders during the week included a 6-in. vertical shaper purchased by Defiance Pressed Steel Co., Defiance, Ohio, and two double-spindle drilling machines bought by Cleveland Tractor Co., Cleveland. Presses continue in good demand. Mullins Mfg. Co., Salem, Ohio, bought two toggle and four double-crank presses the past week. This order amounted to approximately \$125,000. These machines comprise a first unit to be purchased for equipping an extension to be erected by the Mullins company. It is understood that four additional similar units will be required.

Western Stamping & Mfg. Co., which has had its headquarters in St. Paul, Minn., has acquired a plant with 30,000 sq. ft. of floor space on Settlement Road, Parma, a Cleveland suburb, and will move its general offices to Cleveland. This company for some time has been operating a branch factory at 2798 East Eighty-third Street, Cleveland. It conducts a general sheet metal stamping business and also manufactures automobile license plates and highway signs. T. R. Willwerheid is president, and B. A. Preus general sales manager.

Precision Castings Co., Syracuse, N. Y., has purchased a site on Berea Road, near West 117th Street, Cleveland, and will erect a plant to manufacture die castings.

Wasmer Bolt & Nut Co., Cleveland, recently incorporated, will establish its plant in Bramley Storage & Power building, Athens Avenue.

Stebbens & Rich Brass Mfg. Co., Cleveland, recently organized, will establish plant at 6723 Denison Avenue, to manufacture plumbing supplies.

Cleveland Metal Hose Co., has been incorporated and is erecting a plant at 3710 East Ninety-third Street, to manufacture metal hose. Edward S. Pierce is president and general manager.

Fisher Machine Co., Toledo, Ohio, maker of production machines and tools, formerly at 607 Jefferson Street, is now operating in its new plant at 2109 Canton Avenue.

Gifford Metal Specialties Co., Inc., Toledo, has acquired Lober Radiator & Mfg. Co., 126-134 Eleventh Street, and is operating at that location, specializing in stamping, metal spinning and sample work. A. C. Gifford is president and general manager.

Lorain Automatic Icer Co., Lorain, Ohio, has been organized to manufacture automatic refrigerators. Factory at Lorain has been leased where compressors for unit will be made. Refrigerators and other parts will be purchased and assembly work done at factory. H. E. Hageman, secretary Lorain Telephone Co., is president.

Contract has been let by Lyons Machine Co., 5601 Tillman Avenue, Cleveland, to D. Gilchrist Co., Berea, Ohio,

for one-story addition to machine shop, 50 x 50 ft., to cost about \$30,000. W. G. Caldwell, Ontario and St. Clair Avenues, is architect.

Citizens Necessities Co., Toledo, Ohio, George C. Shepard, vice-president and general manager, is planning construction of two ice-manufacturing plants to cost more than \$400,000 with machinery.

Seiberling Rubber Co., Akron, Ohio, manufacturer of automobile tires and tubes, is planning an expansion and improvement program to cost more than \$400,000.

Cleveland Cutter & Reamer Co., 7406 Madison Avenue, Cleveland, plans one-story addition, 39 x 80 ft., to cost about \$35,000 with equipment.

Willys-Overland Co., Toledo, has awarded general contract to H. J. Speiker & Co., Elm and Utica Streets, for one-story addition to plant on Central Avenue, to cost about \$100,000 with equipment.

Board of Education, Maple Heights, Ohio, contemplates installation of manual training equipment in new high school to cost \$225,000, for which plans will be drawn by A. M. Allen Co., 7016 Euclid Avenue, Cleveland, architect and engineer.

Cincinnati

CINCINNATI, Oct. 15.—That machine-tool sales in the first half of October were sustained at the high level which prevailed in September is the report of local builders. Much of the business is coming from automobile manufacturers, especially from those putting out new models. In some cases orders from the Detroit district are as high as 50 to 60 per cent of current bookings, although the average for the entire market probably would be somewhat less.

Tractor makers have bought small quantities of tools for expanding output, and airplane companies still are a buying factor of consequence. Pending orders are of substantial volume and give promise of a continuation of heavy purchases during at least the next 30 days. Meanwhile, production schedules are taxing the capacity of certain local machine-tool plants, the unfilled orders of which are large.

Cincinnati Car Co., Cincinnati, manufacturer of street cars and industrial locomotives, and Versare Corporation, Albany, N. Y., maker of buses, trackless trolleys and trucks, are to be merged and production centered at Cincinnati. Plans have been approved by boards of directors and await ratification by stockholders.

Ohio Steel Foundry Co., Lagonda Avenue and Gothic Street, Springfield, Ohio, is considering three-story plant unit, 60 x 150 ft., to cost more than \$50,000.

City Council, City Hall, Cincinnati, C. O. Sherrill, city manager, has plans for development of Luken municipal airport in East End section, including hangars, repair and reconditioning shops, and other units, to cost \$375,000. Kruckemeyer & Strong, St. Paul Building, are architects.

Air Corps, Material Division, Wright Field, Dayton, Ohio, is asking bids until Oct. 29 for tow target windlasses and tow target windlass parts, circular 132.

Tennessee Enamel Mfg. Co., Cleveland, Tenn., recently organized by W. B. Evans, Sterling Court, Nashville, Tenn., and as-

sociates, has awarded general contract to W. L. Hailey & Co., 314 Forty-second Avenue North, Nashville, for initial unit of new plant, 200 x 200 ft., on 7-acre tract, to manufacture metal enameled products, to cost more than \$80,000 with equipment.

Board of Water Commissioners, 105-7 North Second Street, Memphis, Tenn., is asking bids until Nov. 7 for a steam turbine reduction gear-driven centrifugal pumping unit and condensing auxiliaries, with capacity of 15-million gal. per day; and one secondary hydraulic-driven pumping unit, with capacity of 1-million gal. per day. James Sheahan is general superintendent.

R. J. Smith Co., Somerset, Ky., plans installation of electrically-operated cold storage plant, to cost about \$40,000 with equipment.

Board of Education, Owensboro, Ky., plans construction of manual training shop for colored students at Western School, and has authorized fund of \$150,000 for this and other school expansion.

Atlantic Ice & Coal Co., Atlanta, Ga., is planning new ice-manufacturing plant at Knoxville, Tenn., to cost about \$180,000 with machinery.

Milwaukee

MILWAUKEE, Oct. 15.—The first half of the month has witnessed further developments in business of machine-tool builders, and dealers also have been greatly encouraged by the volume of transactions. Machine-tool plants as a rule, are operating at capacity, with some working overtime and night shifts in an effort to make specified deliveries.

Belle City Malleable Iron Co., Racine, Wis., which is completing an addition, 77 x 96 ft., has placed contracts with Nelson & Co., local builders, for a power plant addition, 50 x 81 ft., two stories. Engineers are A. A. Wickland & Co., 205 West Wacker Drive, Chicago. C. S. Anderson is secretary-treasurer and general manager.

Badger Foundry Co., Holborn and DeKoven Avenues, Racine, Wis., is starting work on a core-room addition, 70 ft. square, and is inquiring for core-oven equipment.

Vollrath Co., Sheboygan, Wis., manufacturer of enameled utensils and ware, has plans by Richard Philipp, architect, 405 Broadway, Milwaukee, for a one-story addition, 150 x 160 ft., for manufacturing, storage and warehousing. Contracts will be let about Oct. 20.

Gillette Rubber Co., 799 Wisconsin Avenue, Eau Claire, Wis., has placed general contract with Hoeppner-Bartlett Co., local, for a one-story addition, 128 x 200 ft., with foundations for three additional stories. Present work will cost about \$50,000, exclusive of equipment.

Standard Oil Co. of Indiana plans an investment of over \$75,000 in warehouse, tank storage and garage building at Wisconsin Rapids, Wis. Plans are being made by R. N. Allen, company engineer, 910 South Michigan Avenue, Chicago.

Wisconsin Creameries, Inc., 342 Sixth Street, Milwaukee, will spend \$200,000 in construction and equipment of a three-story refrigerator house and distributing plant, 105 x 152 ft. M. Tullgren & Sons Co., 20 Prospect Avenue, are architects.

Detroit

DETROIT, Oct. 15.—Bean Spray Pump Co., Lansing, Mich., is planning one-story addition, to cost about \$40,000 with equipment. J. N. Churchill, Lansing, is architect.

Joseph N. Smith Co., 5914 Federal Avenue, Detroit, manufacturer of automobile hardware, has awarded general contract to Wood Co., Ford Building, for two-story addition, 150 x 800 ft., to cost about \$200,000 with equipment. Smith, Hinchman & Grylls, Marquette Building, are architects and engineers.

Motor Wheel Corporation, Lansing, is reported planning one-story addition, 200 x 220 ft., for wire wheel division, to cost more than \$175,000 with equipment. Another unit will be built for hub production.

Firestone Tire & Rubber Co., Akron, Ohio, has awarded general contract to Owen-Ames-Kimball Co., Grand Rapids, Mich., for four-story factory branch and distributing plant at Grand Rapids, to cost about \$115,000 with equipment.

Board of Supervisors of Wayne County, Court House, Detroit, has authorized purchase of property at Goddard and Middle Belt Highways for new County airport, and has provided for fund of \$2,000,000 for establishment, including hangars, repair and reconditioning shops and other units.

Department of Public Works, City Hall, Detroit, is asking bids until Nov. 14 for equipment for new Connors Creek pumping plant, to cost \$1,250,000 with machinery. B. A. Fellows, City Hall, is city engineer.

Nichols & Shepard Co., Marshall Street, Battle Creek, Mich., manufacturer of agricultural implements, is planning one-story addition, 100 x 400 ft., with smaller unit, 90 x 100 ft., to cost more than \$225,000 including equipment.

Heney Motor Corporation, Freeport, Ill., has purchased plant and business of Weatherproof Body Corporation, Corunna, Mich., and will continue operations as a division of its business. E. C. Morine, heretofore president and general manager of Weatherproof company, will continue with purchasing company, acting as manager of Corunna plant.

Crane Co., 836 South Michigan Avenue, Chicago, is completing plans for one-story factory branch and distributing plant at Detroit, including pipe shop, to cost more than \$100,000 with equipment. Weston & Ellington, Stroh Building, are architects.

Wilcox-Rich Corporation, 6-240 General Motors Building, Detroit, has been formed as consolidation of Rich Products Corporation and Wilcox Products Corporation to manufacture automobile valves, tappets and piston rings. Plant formerly maintained at Detroit by Wilcox corporation is being removed to Marshall, Mich., and some additional machinery is being purchased at Battle Creek and Saginaw, Mich., plants. C. H. L. Flinterman, formerly president of both corporations, is president of consolidated organization. He was previously vice-president and general manager Detroit Pressed Steel Co. and prior to that vice-president Midland Steel Products Co.

Michigan Steel Tube Products Co., Buffalo Street, Detroit, will make extensions and improvements to cost \$300,000. Plans include added manufacturing equipment and extensions to manufacturing building and steel storage buildings. When completed company will have monthly capacity of 5,500,000 ft. of electrically welded steel tubing.

St. Louis

ST. LOUIS, Oct. 15.—Contract has been let by Brass & Copper Sales Co., 1712-14 Chestnut Street, St. Louis, to A. H. Haeseler Building & Contracting Co., Wainwright Building, for a two-story and basement storage and distributing plant, 50 x 130 ft., to cost about \$65,000 with equipment. Klipstein & Rathman, Security Trust Building, are architects.

General Auto & Body Co., 1115 South C Street, Fort Smith, Ark., is planning installation of equipment for repair and reconditioning of automobile bodies, fenders, motor truck and bus bodies, etc. J. E. Finney is in charge.

Evans-Wallower Lead Co., 118 East Fourth Street, Joplin, Mo., is arranging for a preferred stock issue of \$1,125,000, proceeds to be used primarily for erection of new electrolytic zinc plant at East St. Louis, Ill.

Kroger Grocery & Baking Co., 3801 Vista Avenue, St. Louis, has plans for one-story motor truck repair and reconditioning shop, with garage unit, 107 x 360 ft., to cost more than \$100,000 with equipment. Emil H. Nieman, 3816 Shaw Avenue, is architect.

Independent Oil & Gas Co., Tulsa, Okla., has work under way on pipe line to refinery at Okmulgee, Okla., and will increase capacity of refinery from 5000 to 10,000 bbl. per day. Plans are under consideration for installation of pipe line from Okmulgee to point in Greenwood County, Kan., to connect with present line running to Kansas City refining plant.

Home Fertilizer Co., Little Rock, Ark., is planning new plant at Texarkana, Ark., to cost about \$50,000 with equipment. Martin E. Williams is general manager.

Board of Education, Genoa, Neb., is said to be planning installation of manual training shop in two-story high and grade school to cost about \$120,000, for which plans are being drawn by G. Grabe, 304 East Sixth Street, Fremont, Neb., architect.

Pacific Coast

SAN FRANCISCO, Oct. 11.—Imperial Irrigation District, El Centro, Cal., will arrange bond issue of \$1,700,000 for construction of three hydroelectric power plants, utilizing water of valley canals; also bond issue of \$1,800,000 for extensions and improvements in drainage system, pumping system, etc. M. J. Dowd is chief engineer.

Board of Education, Phoenix, Ariz., plans installation of manual training equipment in new high school to cost more than \$400,000, for which bids have been asked on general contract. Lescher & Mahoney, Phoenix, are architects.

Crane Co., San Francisco, and 836 South Michigan Avenue, Chicago, has plans for new one-story factory branch and distributing plant at Emeryville, Cal., to cost close to \$75,000 with equipment.

Union Oil Co., Mills Building, San Francisco, has awarded general contract to William C. Keating, Central Bank Building, Oakland, for new storage and distributing plant at Emeryville, Cal., to cost about \$100,000 with equipment. Engineering department of company is in charge.

Sethman Generator Co., Denver, Colo., manufacturer of electric generating apparatus, is said to be planning construction of new plant at Santa Ana, Cal., and will later remove entire plant to that location, where production will be con-

centrated. Project will cost about \$100,000.

Board of City Trustees, Alturas, Cal., is considering installation of a municipal electric light and power plant to cost about \$150,000, including power lines.

Puget Sound Power & Light Co., Seattle, has authorized construction of first unit of new steam-operated electric power plant on Lake Washington, near Renton, with capacity of 35,000 kw., to cost about \$5,000,000 with transmission lines. Later additional units of like size will be constructed, to develop total output of 210,000 kw.

National Paper Products Co., Church Street, Stockton, Cal., will soon begin superstructure for new two-story plant, to cost about \$90,000 with machinery. General contract has been let to Barrett & Hilp, 918 Harrison Street, San Francisco. Leland Rosener, 233 Sansome Street, San Francisco, is engineer.

Ontario and Chaffey Union High School District, Ontario, Cal., is having plans drawn for an addition to mechanical arts building, to cost about \$35,000 with equipment. An industrial high school unit is also planned. Allison & Allison, Hibernian Building, Los Angeles, are architects.

Canada

TORONTO, Oct. 15. — Machine-tool sales, while mostly in units of one or two, total a good volume. A few small lists have recently appeared and others for complete new plant equipment are in preparation. The automotive industry is showing more interest in the market and some extensive buying is expected for new works. A good demand for equipment is coming from pulp and paper mills, power development, mining and wood-working plants. Second-hand tools are also moving well.

Dominion Alloy Steel Corporation, Sarnia, Ont., is arranging for installation of equipment to double present capacity.

Canadian Goodrich Co., Kitchener, Ont., will erect an addition to its plant to cost \$250,000, which will provide 35 per cent increase in production.

Factory at Dundas, Ont., owned by Jones Brothers Co., Ltd., manufacturer of show cases, office furniture, etc., was damaged by fire Oct. 12, with a loss of \$30,000. It will be rebuilt and new equipment installed.

Anglin-Norcross, Ltd., Temple Building, Toronto, general contractor, has awarded a number of sub-trades for \$150,000 addition to plant of Flint Paint & Varnish Co., Ltd., Perth Avenue. Construction work will be started immediately.

Church Ross Co., Ltd., 698 St. Catharine Street West, Montreal, has let sub-trades for \$235,000 addition to plant of American Can Co., 2065 Jeanne d'Arc Street.

Northern Rubber Co., Metcalfe Street, Guelph, is asking bids for erection of factory to cost \$50,000. James, Proctor & Redfern, Ltd., Excelsior Life Building, Toronto, are engineers. It will be two stories and basement, 60 x 120 ft.

A. H. Coplan, 7 Elemor Avenue, Ottawa, Ont., will build an addition to iron and steel foundry at Hull, Que., to cost \$250,000.

N. Slater Co., Sydney Street, Hamilton, Ont., manufacturer of hardware specialties, etc., will build a two-story addition, 100 x 160 ft., to cost \$25,000. Mitchell

& Riddell, 46 Head Street, have general contract.

B. Greening Wire Co., Ltd., 55 Queen Street North, Hamilton, Ont., has let contract to Stuart Brothers, 15 Hyde Park Avenue, for one-story addition.

Foreign

PLANS are under way by Soviet Russian Government for purchases of agricultural implements, tractors, and kindred equipment. S. S. Loboff, vice-president of Supreme Economic Council of Government, accompanied by other members of Council, has arrived in United States primarily for this purpose and will make headquarters at offices of Amtorg Trading Corporation, 165 Broadway, New York, official buying agency for Soviet Government. Another delegation headed by W. Korobovkin, president of Embanef, one of three large oil producing organizations in Soviet Russia, has also arrived in United States to purchase oil refining equipment and other oil field apparatus, including storage and distributing equipment, and also will make headquarters at Amtorg Trading Corporation offices.

Electric Bond & Share Co., 2 Rector Street, New York, has purchased electric properties in Chile and Mexico of Whitehall Electric Investments, Ltd., London, to be operated by American & Foreign Power Co., a subsidiary of purchasing company. Acquisitions include companies in Santiago and Valparaiso, Chile; Tampico, Puebla and Vera Cruz, Mexico. Sale involves about \$50,000,000. New owner plans expansion and improvements.

Commonwealth Department of Works and Railways, Chelford House, Flinders Lane, Melbourne, Australia, is planning construction of new railroad in Western Australia, known as the Ejanding, and is expected to ask bids for equipment and supplies at once. Project will cost about \$2,000,000.

Gronberg & Co., Dickursby, near Helsingfors, Finland, have approved plans for a new plant for production of carbon dioxide, white lead and kindred products, to cost more than \$400,000. Company is operating with capital of 3,600,000 Finnish marks.

Graham-Paige Motors Corporation, Detroit, has acquired property at Johannisthal, Germany, with building totaling about 57,000 sq. ft. for establishment of new assembling plant.

New Trade Publications

Kinite Dies and Tools.—Kinite Corporation, Milwaukee. Booklet No. 11 describes this patented alloy steel which may be cast in intricate shapes, forged if necessary, and machined. It is said to heat-treat and air-harden with negligible distortion and to resist heavy pressures without change in dimension.

Gasoline Locomotives.—Mid-West Locomotive Works, Hamilton, Ohio. Booklet of 24 pages describing gear-driven gasoline locomotives in four sizes, from 4 to 10 tons. Specifications for the 10-ton unit show four speeds up to 13½ miles an hour. Illustrations show both details and installation views.

Dry Coke Quencher.—Dry Quenching Equipment Corporation, 200 Madison Avenue, New York. Folder DQ-3 of six pages illustrates and describes the Sulzer dry quenching equipment for coke. The unit shown has a capacity of 15 tons in 24 hr. It uses the heat to produce steam.

VOL. 122, No. 17

Profits by Close Material Control

Timing Deliveries to Meet Production Schedules, Based on Sales Forecasts, Permits Stutz Company to Turn Over Stock 15 Times Yearly

BY L. A. BARON*

MAINTENANCE of a minimum inventory to secure maximum turnover is the basic principle of the plan for controlling materials which has enabled the Stutz Motor Car Co. of America, Inc., to turn over its stock 15 times annually in the past two years. This is done by timing deliveries of purchased goods to meet current production schedules established as a result of frequent forecasts of sales. In fact, stock has been so controlled that the physical inventory as compared with the book inventory has shown a shrinkage of less than $\frac{1}{2}$ of 1 per cent in value. An account of the factors entering into these accomplishments involves an explanation of the system for regulating stocks.

About 5 per cent of the parts going into direct material costs of the Stutz automobile are fashioned from raw materials in our plant, the remaining 95 per cent coming to

*Comptroller, Stutz Motor Car Co. of America, Inc., Indianapolis.

us as rough, semi-finished or finished parts. Regardless of the state in which material is received it is considered "productive material" from the standpoint of accounting, and therefore no distinction is made on our books. In fact, the designation "productive material" is used for all direct material costs up to the time that shipments are transferred to "cost of sales."

Every piece entering into the Stutz car is either designed or specified by the engineering department. The individual pieces or parts are given both name and number, by which they are identified thereafter. When a new part is designed, a blueprint giving the necessary specifications is furnished the purchasing department for use in ordering the part or the material from which it is to be manufactured. A copy of the blueprint and an "experimental material release notice," Fig. 1, is sent to all other departments concerned. This notice states whether the part is to be manufactured in the plant or is to be purchased and speci-

Incoming Materials Are Promptly Inspected Either In the Receiving Room or On the Assembly Floors. The inspection of valve springs and timing chains is shown

fies the name and number of the part, the material and other details. If the design proves satisfactory in experimental work, the part is approved by the chief engineer and is released for production on a form designated as an "engineering release," Fig. 2. It then is written into the "bill of materials," the form of which may be noted from Fig. 3, and becomes a part of our product thereafter. Changes in the design of parts in production are covered by the "engineering change" notice, Fig. 4, and such changes are written into the bill of materials. Incidentally, the bill of materials is an important requisite, being used constantly by the purchasing department, foremen, inspectors, stock chasers, cost accountants and others.

Material Contracts Based on Sales Forecasts

Near the end of the year the management and the sales department together forecast the probable sales volume for

the following year. When this information is released, the purchasing department solicits bids and places contracts for the estimated requirements for the 12 months. The contracts, which cover not only probable production needs, but also spoilage and service requirements, generally do not designate specific quantities of material.

Production materials are ordered from vendors on the purchase order, shown in Fig. 5. This order is made up from a purchase requisition which specifies the shipping date, and gives a complete description of the part, packing instructions, price and terms. A special order form is used for service stores, and another for factory supplies and expense items.

Before the purchase order is released to the vendor, study of the processing time must be made for each part. By process time is meant the vendor's time, plus transpor-

GEN. DIV. BILL OF MAT. FOR SERIES 131" WHEEL BASE CHASSIS - AFTER APPROX. 2500 SERIES BB CARS						THIS SHEET SUPERSEDES SHEET DATED THIS SHEET IS SUPERSEDED BY SHEET DATED			

Fig. 3—Bill of Materials. Upon completion of experimental work, the new part, if approved by the chief engineer, is released for production. At the same time, all necessary data are written into the bill of materials

tation time, plus our time. Thus, when the purchasing department contracts for the purchase of a part, it obtains the vendor's process and shipping time. Moreover, when the engineering department releases a part for production, the material supervisor informs the purchasing department as to the factory process time, which varies from 48 hr. on local pick-up items to 90 days on such parts as bodies and crankshafts. When production is being maintained on schedule, bodies and crankshafts for cars coming off the assembly line today should have been received not less than 20 days previously.

Five copies are made of the purchase order, one of which is sent to the vendor, one to the cost department and one to the receiving department, while two are retained by the purchasing department.

Materials and Supplies Controlled by Material Supervisor

As soon as material enters the plant it passes under the control of the material supervisor, who has charge of all "productive material" and factory supplies within the plant. The receiving room, interior trucking, stock chasers' material records and many other activities are under his supervision. About 90 per cent of the parts received are unpacked and counted in the receiving room, the remaining 10 per cent, constituting bulky materials such as cushion springs, fenders, bodies and frames, being delivered directly to the first station along the production line.

The receiving department makes out the report shown in Fig. 6 for every lot of material delivered to the plant. Six copies are prepared. The first is attached to the vendor's invoice and forwarded to the accounting department, while the second is used by the purchasing department to complete its record of the purchase order. The third is re-

tained in the receiving department, and the fourth is sent to the material supervisor to complete the material record. The fifth and sixth are sent with the material to the receiving inspection room, the former being kept by the inspection department and the latter going to the point on the assembly line where the material is to be used.

Incoming Material Inspected

All materials are inspected in the receiving inspection room or on the assembly floors as rapidly as delivered. While in the process of inspection the materials are temporarily out of the jurisdiction of the material supervisor and are under control of the chief inspector, who is responsible directly to the president of the company.

Parts that do not pass the receiving inspection are covered by the "defective material receiving inspection report," shown in Fig. 7, which, in addition to a complete description of the material, records the vendor's name, purchase order number and the reasons for rejection. In case the supplier has failed to comply with our specifications, the report is stamped "return to vendor for replacement." A similar report is used for parts having defects that are found later in the course of production and for which the vendor is responsible. The only difference between the two reports is that the latter states the department in which the material was found and how far it had progressed along the line toward completion.

Both reports are filled out in triplicate, one copy being sent to the material supervisor for his records, the second to the purchasing department for use in making replacement purchase requisitions and in preparing shipping instructions for the return to vendor; and the third is retained by the inspection department. The purchasing department makes out a shipping order, and the vendor is

As a further means of controlling material, one person in each department is designated to watch the stock. He may be a member of the stock department or an assistant foreman. On every part a minimum quantity is set to comply with production schedules and when the supply approaches the minimum, a report is made to the material supervisor. The reports, made by each department, are compiled each morning into a "dangerous shortage report." This shortage list is checked against unfilled purchase orders and steps are taken to expedite deliveries or to place orders to cover the shortage.

When the material supervisor checks his records against the "dangerous shortage report" he ascertains the reason for the shortage. If the shortage cannot be reconciled with the stock records, he issues an "unaccountable loss" report, or "productive material loss" report, Fig. 8, in duplicate and corrects his records to conform to the actual count. One copy of this report, which shows the quantity lost and the department responsible, is sent to the purchasing department

for a "shortage purchase order" and the other is forwarded to the cost department for charges against the department responsible and credit to inventory.

How the Inventory Is Maintained

An inventory of cars in process and of finished cars is kept both by the sales order department and the material supervisor. While we try to build the cars to predetermined production schedules, in reality our operations are usually governed by the number of bodies received. The inventory is maintained in the following manner. When a sales order is received, the order department checks over the inventory to ascertain what cars are in process and what are completed, ready for shipment. If no cars are available, a sales shipping order is made out and a copy dispatched to the material supervisor. As soon as a suitable body is received, the order is released for production. When bodies arrive for which there is no shipping order, the material super-

Supervisor of Materials

Supervisor of materials will report all losses of Productive Materials on this form. Duplicate will be forwarded to the Cost Dept.

Fig. 7 (lower right)—The Defective Material Vendor Responsible Report Is Issued for All Parts that Fail to Pass Receiving Inspection. A similar report is made for parts found defective in production and for which the vendor is responsible

The report at the upper left is used for accounting for and replacing damaged parts for which the production departments are responsible

Fig. 8 (lower left)—Productive Material Loss Report Used by the Material Supervisor

visor notifies the sales order department which issues a stock order.

The sales order department and the material supervisor keep records of the bodies received and in process, the records being divided into the various body types. Data given include the paint and trim specifications for each body in process, which is necessary to comply with our sales policy of "no two cars alike," the date that the body passed through the paint and trim department, when it was mounted on the chassis, when the car assembly was completed, when the car passed the final test, the date of shipment and the shipping order number. This record, which is completed daily, is the only inventory of finished products which we carry; it enables the management to tell when any sales order can be filled. Incidentally, for accounting and cost purposes, all cars are in process until they leave the plant for delivery to customers.

Control and purchase of materials for service stores and of factory supplies are handled in the same manner as for productive materials. Service stores is charged with the value of all purchases for its account and is credited with the cost of service parts sales, while supply stores is charged with the value of supply purchases and is credited through the medium of all requisitions covering withdrawals.

It is always necessary for service stores to draw on production for current productive items, such cases being accounted for by means of requisitions whereby productive material stores is properly credited and service stores debited. The material supervisor keeps his material records up to date from these requisitions before they are passed to the cost department for costing and for transfer of charges.

Material Records Compiled from Receiving and Other Reports

The material supervisor compiles his material records from the "receiving reports" covering receipt of goods, "defective material reports" for vendor defects and departmental spoilage, "unaccountable loss reports" for other losses and pilferage, and requisitions for withdrawals by the

service department. To ascertain the amount of any given part on hand at any time he figures as follows: Quantity at last physical inventory, plus receipts, and minus returns, the result being the net total debit; scrap, plus service withdrawals, plus requirements on cars produced, gives the total credit; net debit, minus total credit, gives the quantity on hand.

All goods entering the plant are covered by a receiving report, a copy of which is matched by the vendor's invoice and is forwarded to the accounting department. The matching of the receiving reports and the vendor's invoice is done by the purchasing department after it has checked invoices for price, terms and quantity. Every purchase order shows to what account the purchase is to be charged, this information also being written into the receiving report in the receiving department, which obtains the information from its copy of the purchase order. When the accounting department gets the invoices with the receiving reports, it analyzes the purchases on cards. These tabulated data make up the "contra account" for the accounts payable journal.

Car Sales Analyzed Monthly

Analysis of productive material is made in detail and shows the part number, quantity, price of each and the total amount. This information is posted in the material cost records, which are made up in the form of a ledger with separate sheets for each part shown in the bill of materials. Each sheet carries all of the information given in the bill of materials for each part, such as the usage per type of car and the place where the part is used on the car. These parts vary in price from 0.0001 cents for many small items, to \$1,800 for custom built bodies.

Each month the cost department analyzes car sales, separating the cars into different groups. The material cost of each group shipped is compiled, using data contained in the bill of materials and in the material cost records. The total cost is computed by adding up the material costs of the groups. Cost of car sales is then debited and productive material inventory credited.

Aging of Cold-Drawn Metals

In the experimental work described by Dr. L. B. Pfeil, University College, Swansea, in a paper read before the (British) Iron and Steel Institute at the meeting in September at Bilbao, Spain, the tensile test was employed as a measure of the capacity of the metal to undergo age-hardening after cold-drawing, and it is shown that the phenomenon is chiefly due to the presence of carbon. Carbon-free iron is not subject to aging, but iron containing as little as 0.0025 per cent of carbon shows well-developed aging. Iron containing ferrous oxide also exhibits the phenomenon. It is suggested that both carbon and iron oxide are soluble to a small extent in ferrite at ordinary temperatures, but that the solubility is less in distorted crystals, with the result that hardening and strengthening of the duralumin type occurs after cold-working.

Standard Skid Platforms

In order to further the method of shipping goods to ultimate destination on skid platforms, the Division of Simplified Practice of the Bureau of Standards has recommended that the clearance heights be fixed at 8 or 12 in. and the minimum clearance between supports be 29 in. It is estimated that \$700,000 is expended annually in loading and unloading goods which can be shipped on skid plat-

forms, and of this cost approximately one-half would be saved by so doing. This practice facilitates handling all along the line of movement from factory to consumer. Goods thus prepared for shipment are loaded into cars, unloaded onto trucks, and finally moved into the customer's stock rooms without breaking bulk, with a minimum of physical effort, and with a great saving in time.

Short Drop Lessens Segregation in Blast Furnace Burden

To study the changes taking place in porosity of the blast furnace burden, and by that means to get more light on the chemical reactions of iron smelting, the Minneapolis station of the United States Bureau of Mines has been experimenting with scale models one and three feet in diameter. Similar tests have checked quantitatively. Results to date show that, with an equivalent big bell clearance of 2 ft., greater proportions of ore to coke are deposited around the periphery. Coke is also found to have a smaller angle of repose than ore, while larger pieces of ore tend to roll to the center of the furnace. Size segregation may be reduced by depositing material on the stock line as rapidly as possible. This may be accomplished by increasing the bell drop and the angle of the bell, and by decreasing the distance from the stock line to bottom of the bell.

Mass Production of Bolts and Nuts

Manufacture of 3000 Standard Sizes and Types, in Addition to Special Requirements, Calls for Varied and Ingenious Methods and Machines

BY GEORGE A. RICHARDSON*

MODERN demands for mass production, whenever possible and economical, have resulted in the development of distinctive and ingenious methods and equipment for large-scale manufacture of bolts, nuts and related products at the Lebanon, Pa., plant of the Bethlehem Steel Co., where 3000 sizes and types of bolts and nuts are regularly made and carried in stock, not including the much larger variety called for on special specifications.

Plant production sheets show that a minimum of eight and a maximum of 16 to 20 distinct operations are involved in completing a single item, the number depending on the type and degree of finish called for. Each operation requires the use of special machines of various sizes, ranges and capacities.

There are two standards for the manufacture of nuts in common use in this country:

1. *The Shop or Manufacturer's Standard.* Nuts conforming to this are those placed on bolts regularly carried in stock and sold off the shelf. These are sometimes known as bin nuts, a later name which comes from the fact that the nuts are carried in stock in bins. When nuts alone are ordered the United States Standard is usually furnished.

*Bethlehem Steel Co., Bethlehem, Pa.

2. *United States Standard.* Nuts conforming to this standard are slightly larger in dimensions than Shop Standard nuts. Ultimately, both of these standards will be done away with in favor of one sponsored by the Government and various societies. In fact, the movement to effect this simplification is making rapid headway, and shortly the Shop or Manufacturers' Standard will be a thing of the past. Owing to conditions that have to be met, it will take longer to discard the United States Standard entirely.

Nuts are also made hot or cold. In general, all nuts $\frac{1}{2}$ in. and smaller in size are made cold, while those $\frac{5}{8}$ in. and larger are made hot. The exception to this is in the case of $\frac{1}{2}$ in. United States Standard nuts, which may be either hot or cold.

United States Standard nuts are made in different styles and types as follows:

1. Hot pressed, blank and tapped.
2. Cold punched (c. and t.), chamfered and trimmed, blank and tapped.
3. Cold punched (c.p.c. and t.), semi-finished.
4. Bethlehem treated nuts, United States dimensions, specially treated.
5. Standard unit lock nut, United States dimensions, made in same types as above.

Each Hot Nut Machine Is Provided with a Heating Furnace

In addition, Bethlehem makes certain special nuts, including the following:

1. *Ideal Recessed Nut.* This is distinctly a track bolt nut and usually made to special dimensions. It is thicker and of special shape.

2. *Tail Nuts.* Used chiefly on heel bolts on plowshares, etc. So called because of a projecting tail which enables the farmer to turn them up tight by hitting with a stone or hammer.

Bolts are also made to conform to the two standards, although about 1 per cent is made with the United States head in either square or hexagon. Here, too, a movement is on foot to eliminate the two old in favor of the new American standard. Both cold and hot processes are used, the size limit being practically the same as for nuts. In other words, bolts $\frac{1}{2}$ in. diameter x 6 in. long and smaller are made cold. The larger sizes are made hot. All types of bolts are made, including square and hexagon head, carriage, plow, etc.

The problems of a bolt and nut manufacturing plant are complicated by the infinite variety of sizes and types. A further source of complication lies in the big variations in the quantities called for. This condition has a very important bearing on the types of equipment that can be advantageously used and divides the products into two more groupings.

On the one hand are certain products ordered or used in large quantities. In cases of this kind the manufacturer has an

opportunity to utilize the very latest types of automatic machines designed for large-scale mass production.

On the other hand, a large proportion of the products are either of a special nature, or ordered in quantities which do not justify the expense of designing and installing special machinery. In this case, equipment of the more ordinary types must be used, and instead of the highly ingenious automatic machines, semi-automatic and even hand-operated machines are the most economical. This explains why mass production has not been so much employed in some departments as in others.

Both Wrought Iron and Steel Used

Wrought iron and steel are both used in making the finished products. The wrought iron is made direct from pig iron in the puddling department of the Lebanon plant. It is used for the manufacture of boiler staybolts, engine

An Electrically Operated Skip Hoist Dumps the Nuts on a Riddler, Shown in Upper Picture, Which by a Jig Motion Separates the Scrap from the Nuts. Tumbling to knock off scale and sharp corners is the next operation. Lower picture shows tumbling machines and inspectors separating bad from good nuts

bolts, etc., and is handled separately. All steel materials are brought in in the form of billets, coils, flats, rounds and wire from other units of the Bethlehem organization.

Commercial bolts, nuts and related products are made from steel, the form of which depends to a large extent on the size of the finished product. In other words, for the larger bolts and nuts which are made hot, bar stock is used, whereas the smaller sizes are made cold from coils of cold-drawn sections or wire.

Large quantities of bar stock in standard sections are used, and a new 10-in. bar mill has recently been put into operation to insure a uniform source of supply. At present, more than 70 per cent of the total requirements of the plant are rolled on this mill. Odd lots and special sizes are rolled on the older type hand mills.

The 10-in. mill is located in a separate building, together with auxiliary equipment. It is of the looping type, assuring the latest and best practice. The general procedure at

Semi-automatic Tappers, Shown Above, Are Used to Tap the Larger Sizes of Nuts, While Smaller Sizes Are Tapped on Automatic Machines. The operations of the cold nut machines (below) follow a sequence similar to that of the hot nut department

this mill is as follows: Steel standard billets 4 in. x 4 in. x 30 ft. long, made in other Bethlehem plants and stocked in a special billet yard, are transferred by crane and charged by electric machine into the upper end of a gas-fired, 72-ton capacity, continuous heating furnace. The billets are gradually moved from the upper end of the furnace to the discharge point, and, as they travel, are brought up to the proper rolling temperature, in 2 to 4 hr., the time depending upon the size of the finished bars. Small sizes takes longer to roll, and more heating time is required. A mechanically-operated pusher pushes the heated billets out of the furnace on to a roller conveyor and thence to the first stand of rolls in the 16-in. continuous mill. Interposed in the conveyor are shears which cut up the billets into mill lengths.

The rolling equipment consists of a six-stand 16-in. continuous mill, two 14-in. pony roughing stands, two 12-in. strand rolls and two 10-in. strand rolls. Either or both sets

of strand rolls are used, according to the finished size of bar.

Bars Cut and Inspected for Size

On leaving the finishing rolls, the bars pass to the hot bed and on the way are cut by automatic rotary flying shears into 150-ft. lengths. Squares, rounds and flats are rolled on this mill, the range of sizes for squares and rounds being $31/64$ in. to $1\frac{1}{4}$ in. diameter. For flats, the size limits are $1\frac{1}{64}$ in. to $2\frac{1}{2}$ in. wide x $\frac{5}{8}$ to $1\frac{1}{2}$ in. thick.

On the hot bed, the bars are inspected for size. As they cool, they are moved over from one side to the other by an arrangement of rockers. There they drop on to a conveyor, which carries them to a set of hand-controlled shears, where they are cut up into 30-ft. lengths. These are inspected, bundled and the bundles tagged with metal tags, showing the size, heat number and other information. The bundles are then transferred to a large storage building immediate-

Facing Practice with New Hand Fed Machines (Above) Is to Run the Nuts on to a Threaded Mandrel, Thus Obtaining an Accurate Face Which Sets Level. Nuts $\frac{7}{8}$ in. and smaller are tapped on automatic machines (below), while larger sizes are taken care of on hand fed or semi-automatic machines

The hot nut shop is equipped with both hand fed and automatic machines, and has a capacity of 150,000 lb. of nuts per 10-hr. day. Square or hexagon nuts, $\frac{5}{8}$ in. to $3\frac{1}{2}$ in., can be made on the hand fed machines. The size range of the automatic machines is not so great, extending only to $1\frac{3}{8}$ in. square or hexagon, in either standard. Sizes larger than $3\frac{1}{2}$ in. are made either on forging machines, or, as is the modern practice to a limited extent, from bars on a lathe.

Each hot nut machine is provided with a heating furnace. Pulverized coal, reduced to proper fineness in a central plant, is used as a fuel, and gives very satisfactory results, because close control of the feed is readily obtained. An overhead screw feed brings the coal to hoppers located over each furnace and from here it is fed with the aid of two screws and an air blast. In one or two cases the coal is sucked out of the hopper by vacuum.

ly adjacent and kept until needed for use in the factory department.

Operations for Finishing the Products

This brief description of the rolling facilities and sources of supply of materials brings us to the operations involved in the manufacture of the finished product. With the exception of track bolts, rivets, screw spikes, and certain types of bolts, all preliminary operations are performed in units comprising parts of the older division of the plant. The most important preliminary operation is that of forming the material, i.e., bolt stock is cut to length and headed, blanks for nuts cut and punched, etc. All finishing operations are performed in the finishing department to which the semi-finished products are transferred.

The five departments in the old division of the plant which do the actual working up of the material are: Hot nut department, cold nut department, hot bolt department, cold bolt department and No. 3 threading department.

Hot Nut Shop Makes 150,000 Lb. Per Day

As already mentioned, all nuts from $\frac{5}{8}$ in. upward are made hot. In addition, United States nuts in the $\frac{1}{2}$ -in. size may be made hot.

In making nuts, flat bar stock is used, the length running from 8 to 9 ft. in the case of a hand fed or center feed type machine. To give some idea of the size of bars required two typical examples are mentioned below:

For bolts $\frac{3}{8}$ in. diameter, the United States size of the nuts will be $11/16$ in. x $\frac{3}{8}$ in. x $5/16$ in. thick, calling for a flat $21/32$ in. x $25/64$ in. Normally, bin nuts or Manufacturers' Standard would be supplied on bolts of this size, and in that case the dimensions would be somewhat smaller.

For a $3\frac{1}{2}$ -in. diameter bolt, a United States nut would always be furnished, the dimensions being $5\frac{3}{8}$ in. x $3\frac{1}{2}$ x $3\frac{3}{32}$ in. thick, for which a flat 5 in. x $3\frac{15}{16}$ in. is the proper size.

These examples represent the standard practice for square and hexagon nuts.

Bars of the proper size are placed in the heating furnace and about three feet of one end brought to forging temperature. After this amount is worked up the bar is replaced in the furnace and another section is heated. As a result of this practice, it is customary to start charging at one side of the furnace and continue until there is a full charge, 40 to 45 bars, across the entire front. When the first bar has come up to temperature it is removed and the practice from then on is to "cut across"; in other words,

as soon as one bar has been cut at the end it goes back to its same position in the furnace for reheating. In this way the nut maker goes back and forth until it is time to start all over again with a new charge.

Making Rough Blank Requires Four Operations

Four operations are required in the machine to form a rough blank, these being in sequence as follows:

1. As end of heated bar is placed in machine a piece of the proper length is cut off and shoved in the die. The die is stationary and fastened in the die block. The moving parts are the punch, piercer and crowner.
2. The piece is pierced and crowned.
3. The crowner comes forward still further and ejects the nut.
4. A "picker" comes down, knocks the blank nut off the crowner, and on to a flight conveyor, which carries it to a container holding about 3000 lb. When full, the container is transferred by electric truck to temporary storage and weighed.

In the majority of machines, the scrap in the shape of trimmings and punchings goes into the containers with the blanks and is separated later as described below. A few of the machines, however, used for square nuts only, from $\frac{3}{8}$ in. to $\frac{5}{8}$ in., separate the scrap at the machine and not only eliminate the necessity of riddling but finish the blanks in such a manner that burring is not required.

Storage battery trucks carry the containers in temporary storage to an electrically operated skip hoist, into which the contents are dumped, lifted, and poured down on to the screen of the riddler. This is a machine of the jig type, the screen being rapidly moved back and forth. The scrap drops through the screen into a small car and is ultimately disposed of for remelting purposes. The blank nuts slide down into another container and are ready for the next operation, known as "burring."

The burr formed at the point of punching must be removed by machine. Semi-automatic, two-spindle burring machines, which burr two nuts at one time, are used. The blank nuts are set by hand in dies or jigs, mounted on a flat revolving turret. As this turret rotates, it stops at points so located that two blanks come under the two spindles, each provided with three high-speed steel cutters. These descend and cut the burr off. At the same time, the

two nuts burred in the previous operation are brought over openings through which punches push them so that they drop into a container. The two operations of trimming off the burr and pushing the nuts out of the dies are performed simultaneously, while a fresh supply of nuts is being placed in the empty jigs; hence, there is very little wasted time. The consideration of safety has not been overlooked and a treadle release brings the machine to a stop in case of necessity.

Scale Knocked Off by Tumbling

Tumbling to knock off scale and sharp corners is the next operation. The nuts are carried to the tumblers, long motor-driven cylinders, in containers holding about 1400 lb.

All nuts, with the Exception of Track Bolt Nuts, Are Cleaned in a Hot Chemical Solution Which Cuts the Oil. The upper picture shows the "washing" machine. A machine for castelling nuts (below) consists of a revolving drum containing four grooves in which jigs or chucks are mounted

each. After tumbling, the nuts pass directly out at the far end on to a sorting table, where there is a thorough inspection and sorting. There has already been a partial inspection at the burring machines, where operators throw out any half nuts. Inspectors spread out the nuts, turn them over and eliminate those with cracks, unclear burring, poorly formed blanks, and any other imperfections. These men become very expert.

The nuts are again dumped into containers and transferred to the loading station, thence in turn they are delivered to the finishing department.

A few automatic hot nut machines are in use, and for these 30-ft. bars are furnished. The latter are transferred from the storage building on racks, the sides of which drop, forming a table for the approach of the bars to the oil-fired furnaces. The bars are fed into the furnaces by hand and pushed out into the pinch rolls of the hot-nut machines.

With the exception of the automatic features, the operation of these machines is similar to that of the hand fed machines. There is one slight change in practice. In the case of the hand fed machines, the bars are rotated at each cutting-off position to offset the bending action at the die. This rotation is not necessary in the automatic machines, because their greater bearing surface offsets the bending action.

A few production figures help to visualize the amount of work that can be done. One hundred 1-in. hexagon nuts weigh 56.14 lb. About 6000 lb. of these can be made in a day's run on a hand fed machine and the capacity is increased to about 8000 lb. in the case of square nuts. The scrap loss is necessarily quite large, as it includes the punchings as well as the portions trimmed off. For hexagon nuts, the average amount of material scrapped is 50 per cent. This is lowered to about 32 per cent in the case of square nuts.

Operations in the Cold Nut Department

The number of operations involved in producing blanks in the cold nut department is considerably reduced by reason of the fact that when they leave the machine they are ready for transfer direct to the finishing department without riddling, burring, etc.

The stock comes in coils in usual weights of 200, 250 or 275 lb. each. Bin nuts from 3/16 in. up to and including 5/8 in. square and all United States sizes, including 9/16 in. hexagon and square, can be made on these machines, which produce from 60 to 80 nuts per min. per machine, according to the size.

The operations of the cold nut machines follow a sequence similar to that of the hot machines. The stock entering the machine is cut off, formed with a forming punch and punched, after which the blanks go to the finishing dies. Tumbling, sorting and inspecting follow and the nuts are then ready for transfer to the finishing department.

The finishing department, where all the various finishing operations on bolts and nuts are performed, is an interesting section of the Lebanon plant. Here, in addition to the more commonplace types of machines, are automatic machines designed for mass production on a large scale. This department is housed in half of a large steel and brick building, which is about 375 ft. wide by 1150 ft. long. The other half is used as a warehouse.

The exact point at which material enters the finishing departments depends upon the amount and kind of finishing specified. Nuts classified as "rough" go direct to the tapping department, tapping being the only operation before inspection and washing. Semi-finished, on the other hand, require a number of additional operations and enter at the west end of the building. Semi-finished nuts are chamfered and trimmed and faced on the bottom. Finished nuts are made from cold-drawn steel on an automatic lathe.

The general order of work in the case of semi-finished nuts runs somewhat as follows: Flatten, chamfer, trim,

tap, face, castellate if required, wash and inspect. (Both semi-finished and finished nuts may be castellated.)

The various operations and machines are grouped in bays, of which there are three. All nuts are finished in the north bay; large bolts in the middle bay, and all 1/2 in. and smaller bolts are handled in the south bay.

The more important operations in their logical sequence without regard to individual specifications are as follows:

Flattening.—Although a commonly used term, "pressing" really better describes this first operation, which is for the purpose of obtaining a more uniform thickness and making the nuts more level. It is a preliminary operation for chamfering and is done in semi-automatic, hand fed presses.

Chamfering.—Chamfering is the operation of beveling the corners of the nuts. Equipment of the general description mentioned above is used, modifications being made according to the nature of the work involved.

Trimming.—The number of trimming operations depends on: (a) The size of the nut; 1 1/8 to 1 3/4-in. nuts are trimmed five times; 1/2 to 3/8-in. are trimmed three times; (b) the quality of the stock and the tolerance allowed for irregularities.

Inspection.—A thorough inspection is made here for both surface and general imperfections. This is only one of numerous inspections. There is an inspection at each individual operation.

Tapping.—One of the most interesting parts of the nut section of the finishing department is the division where tapping is done. Nuts 7/8 in. and smaller are tapped on automatic machines, while the larger sizes are taken care of on hand fed or semi-automatic machines. The semi-automatic tapping machines, depending upon the individual design, are fed by hand, either directly to the tap, or into a slot leading to the tap. The taps are automatically raised and lowered and as they come down tap the nuts which have been pushed into position. These nuts remain on the taps until the taps are filled. The taps, which fill in rotation, are lifted out, one at a time, while the machine is operating and the nuts are stripped off by hand. The taps are then reset in the machines. One group of 39 automatic machines is used for the smaller nuts; these machines are capable of tapping from 1,000,000 to 1,500,000 per day. Operations are as follows:

The nuts to be tapped are delivered in containers holding from 1000 to 2000 lb. each. These are dumped by crane into stock bins at the top of the machine. The nuts feed down from these bins by gravity into an open hopper. A circular disk, in the periphery of which are small lugs, rotates in the hopper. The lugs lift or pick up the nuts and push them into a narrow chute or track, down which they slide, one at a time, to a pusher or finger which, moving in and out, pushes the nuts on to the tap.

The tap used is bent, and thus differs from the ordinary. It is mounted in a revolving head and rotates with the head. The nuts, either square or hexagon, instead of being removed after tapping from the tap end, pass off over the shank and drop down into the inspection pan.

Inspectors watch for imperfect tapping. When there is evidence of this, the machine is stopped and steps taken to correct the cause of the trouble. Small pans are used so that if a defect develops only a few nuts instead of several thousand need to be sorted.

With machines of this character 19 1/4-in. nuts and 21 5/8-in. nuts are tapped per min. The greater tapping speed of the larger nut is due to its coarser thread.

In some cases, nuts, after tapping, go direct to nearby sorting benches, where they are inspected and sorted. Other operations may follow, first, however, as indicated below:

Facing.—Facing, when required, is done on special machines. In the facing operation, the cutter puts on a washer effect. The older practice of facing was simply to chuck nuts and run the cutter over them, with the result that a

good bearing surface was seldom obtained. Facing practice with new hand fed machines is to run the nuts on to a threaded mandrel, thus obtaining an accurate face which sets level. Nuts from $\frac{3}{4}$ in. to 2 in. can be handled on these machines and the facing made to an accuracy of 0.002 in.

Castellating.—Nuts are castellated to meet A. S. M. E. specifications. The new machines used are comparatively simple but effective in their operation. A rotating drum contains four grooves in which jigs or chucks of the size and shape necessary are mounted. The nuts are placed in these and as the drum rotates pass under milling cutters located at the top of the machine, which cut one slot at a time. As the drum continues to rotate, the nuts drop out and are set in position again for the cutting of the second groove. Any nut from $\frac{1}{4}$ in. to 2 in. may be handled on this equipment.

Washing.—All nuts, with the exception of track bolt nuts, are cleaned in a hot chemical solution which cuts the oil. A very slight film of oil remains to protect the nuts against rust. Nuts to be washed are dumped into the hopper of the washing machine, and from there drop into a drum which holds the cleaning solution. This is equipped

with steam pipes for keeping it at the proper temperature. The nuts are agitated in the solution and pass on to a rotating screen which allows the surplus liquid to drain off. A short belt conveyor on which they dry by their own heat carries them to a container.

Belt Inspection.—After washing, all cold-punched nuts are sorted, receiving a 100 per cent inspection. This so-called "belt inspection" is something that the plant people consider especially worth while, and is a very thorough job. The nuts travel on belts passing before a number of inspectors. After inspection the nuts go in containers to the warehouse. Special nuts go direct to packing and shipping floors.

The procedure described covers the operations involved in finishing the different kinds of the regular sizes of nuts. Large nuts, particularly special ones, are finished in the machine shop.

A division of the finishing department is given over to facilities for doing special cold forming jobs. These include punching machines, presses, shears, etc.

(In a subsequent article, the finishing of bolts will be described.)

Advocates Arc Welded Steel Construction

ARC welding for steel construction was discussed at the meeting of the American Gear Manufacturers Association, Buffalo, Oct. 11, 12 and 13, by J. F. Lincoln, vice-president and general manager Lincoln Electric Co., Cleveland. What he had to say was in part as follows:

"Structural steel," said Mr. Lincoln, "has a tensile strength of approximately 60,000 lb. per sq. in.; the strength of cast iron is but little more than one-fifth of this. Structural steel has a modulus of elasticity of 30,000,000; cast iron a modulus of elasticity of 12,000,000. In general, a factor of safety twice as great is used for cast iron as for steel.

"The price per pound of structural steel is no more than one-third that of iron castings. Translating this, if a structure is to be made the efficiency of which depends upon tensile strength, the material cost, if made from structural steel, will be no greater than one-fifteenth of what it would be if made from cast iron. If the factor of safety were to be taken into consideration, the ratio instead of being 15 to 1 would be 30 to 1. If the structure depends for its success on its stiffness, as in bases, bridges, etc., the ratio would be $7\frac{1}{2}$ to 1 without the factor of safety, and 15 to 1 with it.

"It is evident, therefore, that the ratio between the material cost of the same structure, when made from structural steel or cast iron, is great enough to permit a great deal of welding to be done on the steel structure and still make a very considerable saving over a cast structure."

Motors, arc welding machinery and other products of the company in which welded steel parts are used in place of castings, were shown by lantern slides. Redesign of many of these parts to permit the use of welded steel, was begun several years ago, and it was stated that, in general, there has been a reduction of at least 50 per cent in the cost of the structures.

Mental inertia, fear of change in appearance and the lack of information by committees and technical bodies were discussed in connection with the failure to use the arc welding process in many possible applications.

Sees Wide Use of Welded Steel In Next 10 Years

Within the next 10 years, 85 per cent of the castings being made today will be replaced by welded steel parts, said Mr. Lincoln.

"The profound result of this on industry can be well imagined," he said. "Inventories of castings will be replaced with inventories of structural steel taking about one-fourth the space and at one-tenth the cost. Pattern storage and pattern development, which heretofore has

been a very large item in manufacturing cost, will be eliminated. Breakage and scrap, heretofore an appreciable item, will be done away with because any part which is wrongly machined will be welded up and re-machined. Steel does not break in handling as does cast iron. Hence another great waste will be eliminated.

"Changes in design which heretofore have been difficult will be greatly simplified, and instead of the same model being manufactured without change over a long period of time, changes will be made continually because of the ease, and because of the entire elimination of pattern equipment. Deliveries of special machines will be greatly shortened and the weight of all machinery will be materially decreased.

"This change is not going to be a revolution, it will be an evolution. It does not mean that your present organization must be replaced; it does mean that your designers and your plant officials must become welding-minded so that they will see a structure not as an accumulation of castings and rivets, but as a structure built up by joined pieces of steel, making a much better structure at a much lower cost."

Use of welded steel in the manufacture of shears, punches, iron workers, fans and bases, was outlined by C. A. Booth, the Buffalo Forge Co. Gears of welded steel plate have been made experimentally. Those made so far have been noisy, but they are being redesigned and it is expected that the noise will be eliminated.

Rockwell Hardness Tester Compared with Others

British comments on the value of the Rockwell hardness testing apparatus were presented before the (British) Institute of Metals at its autumn meeting in Liverpool, England, Sept. 5 and 6. In a paper, "The Rockwell Hardness Test," by J. E. Malam, Birmingham, England, the author described work carried out to furnish data for conversion between (1) Rockwell and Brinell and (2) Rockwell and scleroscope numbers for 95:5, and 70:30 copper and 63:37 copper-zinc and 80:20 cupro-nickel alloys.

An examination of these data led to the conclusion that the Rockwell ball test in its present form yields so-called "hardness numbers" which must be considered as quantitatively misleading. Similarly it was found that unscientific results are obtained owing to the arbitrary numbering of the scleroscope scale. It was suggested that a representative committee be set up in order to consider the whole subject of hardness testing.

Selling to Maintain Prosperity Margin

Control of Distribution Costs Requires Better Understanding Among Competitors to Curb Professional Buying

BY W. C. CONGER*

FOR any study of sales application, Control of Selling Costs should be divided into four divisions: first, creation of demand; second, establishment of outlets; third, influencing of markets, and fourth, maintenance of sales spirit. Direct returns are possible from capital expended within the second division, while returns for capital invested to bring about results within the first and last two divisions are more indirect.

Creation of Demand

Advertising and personal contact of promotional representatives are the prime means of creating demand. Both efforts should be used in connection with specialty products. For commodity products, constructive advertising alone proves to be sufficient.

Advertising is selling on a mass basis. Its aim is the education of every possible prospect on the product and creating in him the desire for it. Mass selling is more economically done by advertising than by salesmen. There it, however, no more fertile field for the waste of hard earned margins than in the blanket acceptance of an ad-

vertising program, or the execution of a set program without due regard to changes in market conditions.

In the specialty field advertising can best be considered as an introduction for salesmen. It is educational work performed for the purpose of conserving salesmen's time in making explanations, and for the purpose of breaking down sales resistance. Advertising of specialties can be materially supported by the use of promotional sales representatives, making personal presentations and soliciting local assistance. This type of work is performed by an individual or squad of individuals and should never be undertaken unless it is obvious that it will pay to establish some type of local "follow through."

Properly planned advertising in the building field costs between 1 per cent and 3 per cent of the gross volume of business developed; promotion representation generally costs between 3 and 5 per cent of the gross returns, and it is not unlikely that, in cases of extremely scattered contact, it may cost as high as 10 per cent. Unless a substantial percentage of working margin can be made, traceable directly to these returns, a venture is not advocated.

Branch Manager Responsible for Expenses of His Office

BRANCH representation and distribution through dealers are the two main methods of establishing outlets. Expenses of branch offices are controlled best by taking advantage of basic influences. The manager should be made responsible for all expense items. His quota should be a direct ratio of his expense rather than sales expectancy. His bonus should be at a fair rate, never starting above the figure at which the office is producing a return to the company. It should be relatively easy for the manager to earn a bonus for special effort, and that bonus should be paid to him as promptly as possible.

All branch offices should operate on a budget system with expenses sub-divided as follows: Local advertising, automobile maintenance, commissions payable, engineering, insurance, dues and subscriptions, office supplies and postage, rent, light and heat, salaries, taxes, telephone and telegraph, traveling and special expenses. All items with the exception of postage, telephone, telegraph and traveling should be subject to home office approval prior to commitment. Even home office approval must be influenced by policy in preference to circumstances, because circumstances are so liable to control policy.

Local advertising is an item which implies advertising in local media and is not covered in the company's general advertising program. It is local because it identifies the local branch office only and is not beneficial to any other

sales unit outside its territory. The expenses not budgeted must be controlled by the home office management.

Automobiles Provide Frequent Contacts

Automobile maintenance is important because it must be remembered that today's prosperity is due mostly to the frequent contact, with a greater number of sales opportunities made possible, by automobile transportation. Men cannot keep pace with the times without facilities of rapid transit. Sales volume is always in direct ratio with sales contact. It is true under some circumstances it does not pay to maintain extended contact, but it is difficult to single out such circumstances without jeopardizing positive leads for sales. Men drawing \$300 and over per month should arrange for their own automobiles. The company should not be asked to make any consideration for their going and coming from work, but should pay them for the extent to which they use this investment for strictly company business, remembering that depreciation on a car is only slightly increased by the additional business mileage and so should practically all be absorbed in his competitive wage. Of the three possible methods of granting allowances, the monthly allowance, with the recognition for special items, seems most practical and free from misuse. This allowance should be established in accordance with the average mileage expected from the men, with allowance, usually at the end of a year's service, for reconditioning. Young salesmen covering commodity fields, and spending most of their time contacting prospects, should probably

*Vice-president Truscon Steel Co., Youngstown. From an address before Concrete Reinforcing Steel Institute, Shawnee-on-Delaware, Pa., Oct. 2.

have automobiles furnished them by the employing company.

If an organization is operating on the branch office plan it cannot afford additional sales expense in the form of commissions. Contact is all the commission man has to sell and it should be the policy of branch house sales organizations to establish their own contacts and pay excessive rates for outside contact only as special circumstances warrant.

Dealer Distribution for Commodity Products

Dealer distribution is more naturally used in forming a sales organization for commodity products. Dealers are already locally established and successful with certain lines. The direct expense to them of adding a few more commodity products for sale to their regular customers would not add proportionately greater sales costs.

Dealers are not promotional organizations; they are service organizations and when dealers are used for servicing the company must shoulder the responsibility of creation of demand and training of personnel together with market influence and sales spirit.

Dealers usually prefer buying their products outright, keeping the margin derived from resale to themselves. It is not, however, as simple as it sounds because market influence is a national as well as local responsibility and always falls upon the manufacturer as a sales expense. The

dealer will demand lower costs whenever national market influence lowers his resale market and will object, through his weapon of competitive buying, to having his costs raised in the event the manufacturers' investment in market influence proves satisfactory.

Dealer sales organizations are not subject to the definite control of branch office systems, because all items of local expense previously mentioned obviously fall under the jurisdiction of a local independent authority.

Sales Costs Must Be Kept Low

It is as essential that sales costs do not materially exceed competitor's sales costs as it is that production costs do not exceed his. Too rapid contact development increases sales expense out of all proportion. The fact that a certain product is successfully marketed by one organization does not mean that the field is a fertile one from which any group can derive profits. Too many times a house branching into a new line allows its determination to overtake its business judgment and allows inexperienced management to excuse poor returns on the theory of "buying a market."

Administrative expense is subject to top-heaviness both in the form of non-producing employees and non-essential records and accounts. Records kept should have the benefit of constant review of executives and such as are not absolutely essential must be eliminated before they reach the state of expense without return.

Influencing Markets Requires Cooperation of Leaders

MARKETS can best be influenced by constant personal contact between the leaders of those markets. The marketing problems of any two industries or of the same industry within any two cities are not identical. Before any real progress can be made toward market influence it is necessary to have the leaders in each industry and the local leaders within every district personally acquainted. It is essential that they meet in conference often and discuss openly their opinions, handicaps, and progress. Market influence or market control is possible only when those few executives who control the sales policies of the sources of supply sincerely want it. The surest way to invite price competition is to refuse to understand someone who has a right or who is willing to put investment and sales effort back of a market.

There is no necessity for collusion or market frame-ups. There is a necessity for the smaller man realizing that business expansion can be brought about only by exercising the one fundamental of business—service; that any expansion gained by him through cutting the market is ill-gotten and deceptive, and no matter what his gain, it would have been greater had he placed the same brain power back of constructive distribution and secured what share of any locality's business rightfully belonged to him through the character of his market service, at a market level that insured the prosperity margin to all.

Contact and understanding between competitors both locally and nationally is essential in properly sizing up the buyer's arguments. Buying today is being more scientifically handled than selling. In justice to the purchasing agent, however, buying which increases previous quantities by several hundred per cent, and asks for the saving occasioned by the increased quantity to be put into quality, is by no means condemned.

A few months ago the purchasing agent of a large automobile company placed an order for 1500 tons of sheets with a steel company. It was followed a few days later by an order of 3000 tons at a reduced price and with the insistence that the 1500 tons previously placed should be lowered to that price or the entire amount would be given to

a competitor. The president of this automobile company was called into the transaction and the entire volume was placed at the market, because he could realize the danger of such scientific purchasing lowering the margin on steel to a point where wages might be reduced and the demand for automobiles curtailed.

The purchasing agents of our large industrial units today have a greater influence upon the national prosperity than any other group of operators. It behooves sales managers whose responsibility it is to create demand and include the prosperity margin to offset this professional attempt to eliminate it. Buyers are not to blame. Purchasing agents are what sales executives have made them.

Competitive Understanding Necessary

Can sales organizations afford to allow professional buyers to continue to deceive their representatives, and in turn allow representatives, realizing too late that they have been deceived, to concoct additional circumstances to clear themselves and sell the orders at cost? Is it not better for sales executives to spend sufficient time together to understand each other and to realize that there may be divergent opinions of true values. If they cannot secure true value for goods, if contact on service is not sufficient to give recognition at true value, then they should refuse to furnish those goods at less than true value.

Everything in competitive understanding works back to the executives in charge of the sources of supply supporting and appreciating each other and of their refusing to ship goods below cost. Special blanket contracts to large customers, or any manner of protected coverages within any industry should not exist. They only make it necessary for the competitor to reserve the privilege of meeting price competition as he finds it. Such an open privilege exercised on the part of any competitor is sufficient to destroy any market.

The real cause for price cuts is not the mere existence of excess capacity, but the blind grasping for volume to use that capacity. In reality, it matters not whether excess

capacity be 5 per cent or 40 per cent. Grasping for business to fill it is destructive.

Executive Review of Contracts

Supplementing the general market influence, every company should have a field check and a home office check on every contract, and both should be exercised before the company is legally bound to the contract. Our company has recently established a system of executive review of every contract. Each individual contract is analyzed from the standpoint of gross margin over platform cost. Different gross margins are possible within different branches of the company, but we have at our finger tips what the gross margin in every community should be, and when they vary, we find out why. Our margin this year, influenced considerably during these months by the tremendous demand, is likewise influenced by our insistence upon our men that we will not accept business which does not carry its proper gross margin.

Every man is penalized $7\frac{1}{2}$ per cent in sales credit for every 1 per cent in which that gross margin on every contract is lower than that correct level. He is thereby made a part of securing correct margins and if he cuts a contract 5 per cent, he is penalized $37\frac{1}{2}$ per cent of his sales credit, and his bonuses as previously stated are all paid upon the amount of contest credit which he secures over his quota as established by a ratio to his expense. No salesman in any line of specialty business should be allowed to operate without such basic influence supporting correct prices.

A representative's competitive conduct should never require further time and thought in covering up his action. It is far better that he sacrifice business to his competitor than to conduct himself in a manner requiring subterfuge. He should realize that his customers are happiest when they are all paying the same price for their materials. Competitors are all human in their understanding and readily detect unfair methods used against them, with the result of loss of confidence toward future fair dealings.

Many sales policies include the fallacy that the customer is always right. In national markets, however, it is more important to be right with competitors than with cus-

tomers. There are always relatively few competitors who could, if they would apply themselves to the task, influence every industry to prosperity. They cannot be expected to accept excuses in each other's conduct toward common customers and so errors should be corrected to the understanding of these competitors. What does it mean to reduce sales expense by 1 per cent through rigid economy, while on the other hand, through lack of confidence among a few, legitimate profit is cut 50 per cent? This loss in profit is actually an added sales expense.

Pooling of Interests Reduces Costs

Certain industries have reduced their sales costs and increased their competitive understanding through the establishment of quantity survey institutes or estimating bureaus. Such bureaus eliminate duplication of effort, reduce unit costs of estimating and create additional confidence because the estimate held by each competitor is identical. It is a practical method of eliminating cheating or buying by confidential quotations or deliberate omissions.

In some industries honest cooperation might lead to consolidation of facilities within given territories. A lesson might be had from the German industries, which function through what is known as a "community of interest." The firm better equipped to handle an individual operation is allotted that work. There is no need to maintain warehouses and bending facilities within the territories which can afford only one plant. What difference whether reinforcing bars are cut in one yard or another? It is wasteful to have several yards adjoining one another, all working half-time on orders accepted at cost, because of the existence of the other yards. Why not have a product made where it can be made more economically? It would be better for a company to supply another with what it can produce more economically, permitting each firm to sell in its territory free from stiff competition, rather than be subject to excessive and overlapping sales expense.

A "community of interest" within an American specialty industry could extend further than the warehouse facilities. It could extend to having details made by a central bureau. Such seems entirely possible in our vision of the future.

Sales Spirit Depends upon Attitude of Executives

A SALESMAN'S spirit is best maintained by his superior's interest and appreciation of his success. Eliminate too severe criticism, but never go without allowing him to realize that his shortcomings are understood. Every man needs help, not only from his superior, but from his colleague. Convince your personnel that he climbs highest who helps the other most. The moment you find any of your regulations pitting one man against another, charge yourself double before you allow sales energy to be wasted between your own men in conflict.

If two men have worked on a contract over-extend yourself to credit them with it. Your money cost will be repaid many times by the increase in your salesmen's spirit. Industrial management depends more upon management of men than of machines.

Men develop best under strain. They must have problems and they must meet them with the understanding that work is the cornerstone of real happiness. Many times this strain may be of such a character as to cause your men temporarily to misunderstand. Many men stake their jobs upon a single act or decision. They should be corrected every time they approach the breaking point.

Recognition of Services Important

Recognition can be accomplished by individual quota, prize contests, personal letters and visits from executives,

salary increases and promotion in the form of added responsibilities. Prize contests are splendid individual and group incentives. They can be staged between organizations or different communities with the sales opportunities equalized by means of quota and with prizes given to individuals or those teams, departments or offices who within any given period of time, days, weeks, months, or quarters, excel in sales success over their opponents.

Chief executives should personally correspond with the men on the firing line to have their minds influenced by the state of mind of the one who is most vitally in touch with the company's problems. Periodical visits also prevent the local sales manager's viewpoint from being distorted by his closeness to the problems and the broad company's viewpoint can be understood only by personal contact with the leading spirit. It is impossible for any chief executive to visit any local manager without that manager confessing that he has gained new viewpoints.

Company prestige should be maintained at all costs. Men should not be allowed to influence customers from a personal relationship but rather because personally they represent the best organization and the best products. It is a tremendous handicap for a salesman to have a customer feel that he is dealing with him in spite of his dislike for his company.

More Welding on Steel Structures

Welding Society Hears About Four Buildings, One a 12-Story Hotel—Fabrication Shops Avoid Handling Large Pieces

STRUCTURAL steel welding, both in the fabrication shop and for field erection, was the principal topic of discussion at the general meeting of the American Welding Society, held in Philadelphia, Oct. 9 to 12. A digest of the matter presented on this topic is given in the notes below. An interesting talk and motion picture showing the manufacture of steel automobile bodies was also presented. Mr. Meadowcroft's remarks on this topic, describing many new labor-saving devices and machines, will be abstracted in a later issue.

Space prevents a lengthy account of two other topics considered. A paper entitled "Standard Line of D.C. Machines Fabricated by Arc Welding," by R. S. Marthens, C. C. Brinton and F. T. Hague, showed how the Westinghouse Electric & Mfg. Co. has been able to standardize details on its line of medium sized machines, and has

thereby effected many collateral economies in inventory, machine shop and foundry work, and at the same time improved the operating characteristics of the motors.

Two lengthy papers describe the research work undertaken by the San Francisco section. A number of tension test pieces were made under commercial conditions, using both the gas and electric processes. These were then pulled while heated in Prof. Charles Moser's laboratory at Leland Stanford University. Most of the specimens broke in the fire box plate (ultimate strength at room temperature about 67,000 lb. per sq. in.) rather than in the weld metal. Results for the welded joints, therefore, closely paralleled those for the unwelded check specimens: ultimate strength as determined by loading at normal rates increased with temperature to a maximum at about 575 deg. Fahr., above which the values dropped rapidly.

Fabrication of Two Buildings for Heavy Manufacturing

IN a paper entitled "Present Status of Welding Steel Buildings by Electricity," Frank P. McKibben, consulting engineer General Electric Co., noted that a recently compiled list of welded structures included 43 buildings, eight bridges, 28 ships and pontoons, and 11 gas holders. On account of these successful applications he is of the opinion that it will now be comparatively easy for building codes to recognize this new method of construction, espe-

cially as many of the important ones are under revision, to permit the change from 16,000 to the 18,000-lb. unit stress basis sponsored by the American Institute of Steel Construction.

He also presented details of two new welded buildings recently erected by the General Electric Co. One of them, a 42 x 66-ft. extension at Bridgeport, Conn., contains four welded trusses placed on tall steel columns. As in the

building at West Philadelphia (described in *THE IRON AGE* for March 22), considerable saving in weight was effected by eliminating all gusset plates. The Bridgeport trusses were made with T-section chords (a 14-in. beam split down the center of the web), with the angle-iron diagonals edge-welded directly against the stem of the T. At the peak of the roof, the top chord was welded on top flange only; the stem is spliced by welding along each side of the leg of the angles which constitute the central vertical member of the truss.

A two-story beam and column building, 42 x 280 ft. in area, erected at Pittsfield, Mass., was so designed that the floor beams were shipped directly to the site from the mill, thus saving shop handling on a considerable percentage of the total weight. Erection details were also arranged so that nearly all welding was done in the "down" position and no "overhead" welds required. Fig. 1 shows the principal features to be that the floor girders have milled ends, thus allowing them to be welded to the column face, making a rigid transverse bent and fixing the ends. This permitted considerable economy in steel, provides for all wind stresses, and lines up the building precisely during the erection stages.

In both these buildings a unit shearing stress of 3000 lb. per linear inch was used for $\frac{3}{8}$ -in. triangular fillet welds.

Welded Frame for Hotel

Discussing this paper, J. H. Edwards, chief engineer American Bridge Co., said that experience has now been accumulated on nearly all varieties of building frames. Heavy manufacturing buildings with trussed roofs, long columns, traveling and jib cranes and beam-and-column buildings as high as five stories have been successfully erected. He then proceeded to describe the 12-story Homestead Hotel, just completed at Hot Springs, Ark. His company had accepted the contract at \$8 a ton more than a riveted design would cost; welding was required in order to avoid disturbance in inhabited portions of adjoining hotels. Actual costs were somewhat in excess of the contract price. Two welders had no difficulty in keeping up with the erection gang.

Details for this tall tier building were worked out so

as to avoid handling heavy pieces in the shop. Where erection holes were required, it was usually possible to put these holes in a light detail, and then weld the detail in place. Column splices, for instance, were plates made to fit snugly within the outstanding legs of the H columns, and welded in proper place, as shown in Fig. 2. Splice plates were then fitted to the outside to make the joint with machined bolts. Beam seats were also fitted between flanges in a similar manner. Such splices and beam seats were placed a uniform distance apart on each column, irrespective of section. This enabled the beams framing into them to be of uniform length and punching. Use of a loose top plate to fix the floor beams at the end is also indicated in Fig. 2. A peaked roof was erected by carpentering methods, i.e., the rafters were hoisted to place, cut to length, and fillet welded to the wall trusses and hip rafters. No blueprint details of this roof were prepared.

Full sized details as described above were tested at the Bureau of Standards. A column splice sheared through the bolt holes at a load of 340,000 lb. Loaded as a beam, a spliced column broke through the welds at 548,000 lb. Beam seat angles ranging from 4 by 4 to $3\frac{1}{2}$ by 8 in., welded between column flanges, bent down like a stirrup before the welds tore loose. A series of test pieces designed to break a $\frac{3}{8}$ -in. weld in shear gave the following ultimate strengths: Average, 13,400 lb. per linear in. (Maximum, 15,400; minimum, 11,300.)

Marshall Williams, assistant general operating manager American Bridge Co., Pittsburgh, said that experience in fabricating several sizable buildings had convinced him that, while welding is frequently quite advantageous to structural fabrication, it is by no means a universal tool. Among the advantages he cited light truss construction, where it eliminates many plates and minor details. Heavy building columns, after the ends have been milled, may have all details welded on them, thus avoiding further handling. Among the disadvantages are the number of expert welding supervisors required, and the slow rate at which the process operates. Both these increase overhead charges, the latter principally by decreasing the output capacity of the plants. Further experience with the process, it was pointed out, would correct the two difficulties mentioned.

The Personal Element in Welding

G. A. CALDWELL, general superintendent Mississippi Valley Structural Steel Co., Melrose Park, Ill., commented on the spread in values for unit tests, quoted by Mr. Edwards. The range from 11,300 to 15,400 amounts to 36 per cent (figured on the low value). Until more uniform work could be guaranteed he felt that one of two things would occur—either the low value would be adopted by designing engineers, thus penalizing the good workman, or else risks of poor workmanship must be encountered. Certain tests convinced him that it would be relatively easy to grade welders according to their ability, and to keep the poorer ones on less important details. Thus he had tested four welders on three different occasions, some weeks apart; the same ranking was attained in each examination. In comparing the work of another group, each man having made six test pieces, it was found that the work of any one man did not vary more than 10 per cent in strength, but the best weld of the best welder was 35 per cent better than the poorest joint made by the worst. Professor McKibben, answering an inquiry, said that the uniformly higher results of tests now being published, in comparison with those made a few years back, are due to the use of higher current densities. It is well known that the research com-

mittee on structural steel of the American Bureau of Welding is completing an exhaustive series of tests on joints made by both gas and electric processes.

F. T. Llewellyn, president of the society, was doubtful whether a high degree of uniformity could ever be expected from all the workmen in a shop, since it is never attained in any manual operation. He doubted whether the uniformity in riveted joints is any higher than that of welded joints. He also pointed out that there has been more research expended on welding in the past five years than has been put on all other methods of fastening since the beginning. It would be surprising if some mildly conflicting results were not produced. From an erector's standpoint, he asked that some attention be given to field inspection. An open hole advertised itself to a casual glance; but on welded connections the beads must be counted, measured and gaged. Tools for this are lacking.

F. M. Farmer, past president of the society, said that an adequate supply of welders is badly needed. He cited a \$6,000,000 project under way this winter at a Boardwalk hotel in Atlantic City. A frame building is to be replaced with a 13-story structure, a garage is to be built, and a

power house enlarged. Noisy riveting is prohibited, but the hotel building must be completed early next spring. Not being confident of obtaining sufficient personnel, the con-

tractor decided to weld only the power house extension. The hotel frame is to be bolted throughout, and the garage to be made of reinforced concrete.

Erection of Buildings by Welding

A PAPER of the above title was presented by J. C. Lincoln, president Lincoln Electric Co., Cleveland, based largely on experience gained on a four-story business block designed by the Austin Co. As an evidence that design must be made especially for welding, this building departs from the now standard practice of running the columns straight up from foundation to roof, framing the floor beams into them, and goes back to the old fashioned "mill building" construction, where the columns are a single story high, and the main floor beams are continuous from end to end. Special stiffeners are required to transmit the loads from the stories above down through the beam to the column beneath. While this system is all right for low buildings, some structural engineers present doubted whether it would be suitable for tall, narrow buildings which have to resist heavy wind stresses.

Mr. Lincoln said that worth-while economies would not result if the building were designed as if for riveting, and then welding substituted. The shop and erection costs would then be of the same order. Notable savings in steel result, however, if each column is proportioned to the load it is to carry, rather than going two or three stories over-size, if the floor beams are made continuous and fixed at the ends, and if the main girders are reinforced at the center of the span by cover plates and at the supports by web stiffeners. He sketched many devices used for erection

purposes: in general they consist of shelf angles or clips welded to the adjoining members, each with two holes for preliminary bolting. After plumbing the building, all such joints would be properly fixed by welding. Variations in mill lengths of beams cause no trouble if slotted holes are punched in the clips welded to them. The following points must be considered to profit most by structural welding:

1. Design joints to eliminate overhead welding, and minimize vertical welding.
2. Do no more welding than is necessary to carry stresses.
3. Utilize continuous beams of non-uniform cross section.
4. Use "stepped" columns.
5. Bolt up the erection, as at present.
6. Avoid open holes in heavy pieces.
7. Ship as much steel as possible direct to the job.
8. Use large electrodes and large currents.
9. Scarf nothing thinner than ½ in.
10. Use only tested welders.
11. Inspect all joints carefully.

As to costs, Mr. Lincoln said that field welding on this building cost \$2,500. A reliable estimator predicts that this would drop to \$800 by the time the fifth such building were erected.

Floods Fenced Out with Steel

TO protect a half-mile stretch of road against encroachment by the Santa Ana River channel, the California Highway Commission has constructed a novel revetment. Steel pipe is used to replace timber piles, experience having shown that the latter rots below the ground level and fails at critical floods.

As shown in the illustrations, the bank protection consists of a double row of posts, placed 6 ft. on centers. The vertical members are 3-in. pipe, heavily galvanized, approximately 20 ft. long, driven 14 ft. into the ground. Braces are made of the same material, flattened and bolted at the ends, as indicated.

Along the row of posts on the river side there was placed two 58-in. widths of Ellwood fencing, lapped 20 in. at the ground line, where the wear will be the greatest. The upper width of fencing came to within 18 in. of the top of the posts and extended 4 in. below the ground surface, while the lower width of fencing extended 42 in. below the ground surface.

One 58-in. width of the same fencing was fastened along the back row of posts and extended 10 in. below the ground surface with 4 ft. above the surface.

When all fences were in place, the 6-ft. space between the two parallel lines of fence was filled with brush and rock to weight it down.

Urges Study of Business Trends

Need for Considering Changing Conditions, to Avoid Nullifying Production Economies, Pointed Out at Meeting of Industrial Engineers

THE industrial engineer must expand his horizon beyond shop walls and observe the broader currents of business, if he is to anticipate changes that might otherwise offset savings wrought in production, according to Ray M. Hudson, assistant director of the Bureau of Standards, Department of Commerce, who addressed the fifteenth annual convention of the Society of Industrial Engineers, held at the Chamber of Commerce, Rochester, N. Y., Oct. 17, 18 and 19.

"Campaigning for Lower Costs" was the general subject of the convention, which was held in cooperation with the Industrial Management Council of the Rochester Chamber of Commerce and the Rochester Engineering Society. Mr. Hudson's address, delivered at the opening session, was on "Management's Opportunities for Cost Reduction."

"The costs of the changes forced on a business by the new competition, hand-to-mouth buying, market shifts, the migration of industry, research and invention may have absorbed to a greater extent than we realize the economies and savings wrought in production," said Mr. Hudson.

"The question is: 'Could these changes have been foreseen and if so, could they have been handled so as to avoid this absorption of profits?'"

"My answer is 'Yes,' for I am sure the industrial engineer is capable of sensing the approach of new conditions and problems in industry and of preparing to meet them efficiently and economically. But to attain this preparedness, he must first expand his horizon beyond the shop walls and perfect his observation of the broader currents of business. He can do this through review, interpretation and use of the statistics of business. To ignore these indicators of trends is to be caught napping. . . . Why spend months or years perfecting some part of shop management technique if the whole program is 'washed out' by failure to observe important market changes or shifts in the buying habits of your customers?"

Must Reckon With Certain Recent Developments

The contribution to lower costs made by planning and scheduling, labor saving machinery, progressive assembling, and other "primary tools of good management" was emphasized. "There is, however," he said, "a large area of American industry into which these fundamentals have not penetrated, and there is still great opportunity for management to cut costs and assure profits through their wider application."

"Nevertheless, in our zeal to spread their use and to perfect the technique of their application, we must take care that we do not overlook or underestimate the importance of certain recent developments, developments which in their cumulative aspect are altering the very structure of that great organism we call American business. We need to reckon with these newer developments, and learn how to guide, control and apply them to the end that they also may contribute lower costs."

One of the problems discussed was the competition between entire industries as distinguished from that between member plants of a single industry. On this Mr. Hudson said: "The effects on business of the new competition are not easily counted. Nevertheless the pressure it has ex-

erted on old established businesses is evidenced by the struggles some of them are making to hold their places in the line. Products, processes and machinery are being revamped; intensive sales and advertising campaigns are being conducted. Installment selling, liberal credit and financing terms are offered the consumer. But it is not at all certain that these will perpetuate the business offering them and assure a steady or consistent profit. It is still necessary to determine whether some of these endeavors are merely temporary expedients or whether they are permanent features of the new order of business.

"Therefore one of the immediate problems of the industrial engineer is to determine the effects of the new competition on the business with which he is connected. Another of his newer problems is the correct evaluation of the measures or means employed in meeting that competition."

Hand-to-Mouth Buying Affects Production Economies

Hand-to-mouth buying and the small order problem, the next to be taken up, were said to have brought a host of problems in their train. "The conditions giving rise to these developments, the probability of their duration as well as the ways and means to cope with them are also of interest to the industrial engineer. For example, how can he show a profit if short runs on small quantities, frequent changes of machine set-ups, etc., absorb the economies he makes through time study?"

"Along the selling side of the business are these questions: What market shifts are occurring in this field? Is the future of the business in the domestic or in the foreign market? What is a market anyway? Is our common conception of a market, as a vast reservoir to be filled, correct? A market originates in human wants. Therefore markets are people, not places. People move about; they take their habits with them. Sometimes they stay in the same place but change their habits. May we not therefore regard human wants as the prime source of business, and that the market they reflect is not a reservoir, but a 'spring' that flows steadily, year in and year out. Nature provides the spring, man's job is to guard it against diversion, stoppage and contamination, especially if he expects to drink 'long and heartily' therefrom."

Migration of industry was pointed out as another development of recent years. "Studies show definite movements in many lines of industry," said Mr. Hudson. "In some lines, plants are moved closer to the source of raw materials; others closer to their markets; still others are moving to more favorable power sources, climatic conditions, etc. What underlies these movements? Are they undertaken solely because of present costs? Do these shifts, as and when made, assure lower costs and better profits? The answer to this question concerns the industrial engineer."

Research a Source of Larger Profits

Research—commercial, technical and scientific—was emphasized as a frequently neglected source of lower costs and larger profits. In this connection Mr. Hudson said: "There is scarcely any phase of business which cannot be strengthened by research."

"Analysis of markets, and back of them, the study of human wants, gives new conceptions of what to make and where to sell it. Studies of the rate of consumption, the potential buying power of the public, indicate whether or not the public can absorb more of your output. Analysis of present uses of your product, the study of fields of its possible application serve either to increase sales or to establish the point of diminishing returns.

"When to change the style, or redesign the product is not a matter of chance. 'Coming events cast shadows before.' Profitable management requires anticipation of, and insurance against, sudden shifts in the public taste or fancy.

Large Opportunities in Reducing Distribution Costs

"Management's opportunity for cost reduction through research along the distribution side of business is tremendous. Studies of present channels of distribution, the methods employed in each, the actual routes over which goods move, the ways in which goods are packed and shipped, the types of containers used, machinery and equipment for handling goods in transit—every one of these can be studied with profit. To assume we have reached the peak of refinement of simplification in any one of these features is absurd. The greatest opportunities for cost reduction are in distribution. There is no question about that, for practically nothing has been done in this direction, when compared to the great concentration of effort toward reducing production costs. We could well afford to let present production costs alone for the next five years and focus all our energies on whipping this distribution problem.

"Savings made in that end of the business are just as valuable a contribution to a satisfactory annual net profit as those made in production; and they ought to be easier to make."

In a New Era of Business

"Many of our industries seem to suffer from overfondness for 'things as they are,'" said Mr. Hudson, in the concluding paragraphs of his paper. "At least there is a reluctance to 'change,' not entirely accounted for by opposition to the costs of making it. More of us need to look away from the 'good old days and their good old ways,' and take a longer look ahead. If we would be progressive we must watch new developments in both science and business, and be ready to adapt or apply them to our daily operations.

"We are in a new era of business, one in which scientific investigation, application and control are playing a most important part. Rule-of-thumb and empirical methods must give way to the new order. Profits are no longer the difference between selling price and cost. Instead they are the difference between new ideas and old ones, new methods and out-of-date ones, new equipment and obsolete."

Profits from Waste

A MENTAL attitude that abhors waste is the first requirement for waste reduction, said Virgil M. Palmer, engineer of industrial economy, Eastman Kodak Co., Rochester, in a paper presented at a session under the auspices of the manufacturing section of the society's waste elimination committee.

The paper was confined to waste of the materials of industry. This waste, it was pointed out, can be subdivided into three classes, according to its origin. 1. Waste occasioned through low yield or inefficient use of consumable tools, accessories and supplies, 2, waste due to failure to use the by-products from production operations, and 3, waste occasioned by obsolescence of plant, equipment and product. The first class of waste, it was said, should be reduced at its source; it should never be allowed to exist. Many industries have yield figures showing what is considered efficient use of material, and it is fairly easy to calculate actual yield figures in the manufacture of product.

Waste of the second class was emphasized as presenting

perhaps the most difficult, but the greatest, opportunities for profit. Among waste by-products which have been utilized, Mr. Palmer cited blast furnace slag, which, he pointed out, now forms half the volume of 150,000,000 barrels of cement giving, at \$2 per barrel, a gross return of \$150,000,000 per year.

The third class, occasioned by obsolescence of plant, equipment or product, was said many times to be justifiable. It is waste created through discarding the old for the new. It is the price paid for progress and is justified by the benefits attained.

American Scrap Industry Has Large Annual Turnover

"The result of all this is that there is a constantly increasing volume of material to be salvaged and reclaimed," said Mr. Palmer. "According to the magazine *Thrift*, the American scrap industry has attained a place in big business, with an annual turnover of \$1,000,000,000."

Reference was made to the research of the Buffalo chapter of the S. I. E. on "Profits from Waste," particularly the profits derived from its sale and reclamation. One of the objects of this investigation is to find and list some basic principles and common practices for salvage and reclamation work.

Of the 106 companies replying to the questionnaires 61 are rated at over a million, 12 were rated between one-half and one million, and 33 at less than half a million.

Large Companies Have Organized Salvage Departments

It was found that 47 of the 61 largest firms have an organized salvage department; 42 of these departments are operated as a subdivision of other departments, and five are self-contained and in charge of major officials. About half the firms rated between one-half and one million have salvage departments, but only 12 of the 31 smallest companies have such departments. This does not mean that the benefits of salvage are overlooked, said Mr. Palmer, but rather that the prevention of waste at the source is emphasized by many companies; and frequently in the smaller concerns prevention of waste at the source and salvage and reclamation are supervised directly by some major official without having a separate department.

Production superintendents are responsible for salvage in 17 plants; in 17 other plants this work is supervised by a salvage foreman.

In 60 plants, material to be salvaged is collected at a central point for checking, assorting and disposal. In 15 other plants this work is done in the department in which the waste originated. Unnecessary sorting is eliminated in many plants by having separate containers for each kind of waste, and by having the waste put directly into these containers where it is produced.

Replies to a question relating to the value of salvage work were read by Mr. Palmer, one of them being: "Would not attempt to function without it. Acts as a check on all departments and brings to the attention of supervisors all excessive or abusive use of materials."

"Dividend Requirements from Waste Elimination," by C. E. Knoepfel, managing director, Waste Eliminators, Inc., Boston, was another paper at this session.

Working on Time Study Standardization

PROGRESS made by the time study engineering standardization committee of the Society of Industrial Engineers was outlined by the committee secretary, W. B. Lincoln, Jr., A. J. Nystrom & Co., Chicago, at a dinner meeting, held during the society's fifteenth annual convention.

A comprehensive time study engineering bibliography has been compiled. The principal forms and makes of time study watches have been tabulated and recommendations prepared covering the types considered best suited for average use. Specifications for time study boards and other tools of the time study engineer have been developed,

as well as standard time study forms, instruction cards, etc., for use in a variety of industries. A treatise on "Preliminary Survey" has also been completed.

This committee was organized March 18, 1927, for the purpose of: "Formulating a standard time study procedure suitable for general adoption and which would agree in most respects with the best of the many diverse opinions and practices now prevalent in this profession, stressing particularly the necessity for correct standards of task measurement." T. R. Hough, Wilson & Co., Chicago, is chairman.

The standardization work is carried on by five subcommittees, one of which deals with bibliography and terminology, another with production measuring equipment and forms, and a third with time study procedure. The fourth subcommittee, on research, compiles data relating to feeds and speeds, inspection, working conditions, etc.; the fifth, designated as the subcommittee on review, passes on the work of the other subcommittees.

Papers presented at meetings held this year under the committee's auspices in Chicago and Milwaukee have been published in booklet form by the society.

"Time Study—Its Place in the Campaign for Lower Costs," a paper by T. R. Hough, chairman of the standardization committee, was also received with interest at this meeting.

A large collection of time study and related forms, showing wide diversity of practice and the need for standardization in various industries, was on exhibition during the three days of the convention.

Program of Wide Scope

OTHER sessions of the convention were devoted to the elimination of unnecessary fatigue, office management, sales, industrial management education and plant maintenance. Papers at the latter session, the chairman of which was Perry A. Fellows, city engineer, Detroit, were: "Applying Scientific Management Principles to Plant Main-

tenance Work," by R. R. Reese, plant engineer, Packard Motor Car Co., Detroit, and "The Status of Maintenance Organization," by V. S. Karabasz, assistant professor of industry, Wharton School, University of Pennsylvania. Speakers at the opening session included James E. Gleason, president of the Gleason Works and chairman of the Industrial Management Council of the Rochester Chamber of Commerce, and Dr. H. S. Person, managing director of the Taylor Society, New York.

Afternoons were devoted to plant visits, the plants of the North East Electric Co., Gleason Works, Bausch & Lomb Optical Co., Stromberg Carlson Telephone Mfg. Co., Bastian Brothers Co., Eastman Kodak Co., Taylor Instrument Co., and the General Railway Signal Co. being among those open for inspection.

Social features included the banquet, speakers at which were Dr. W. F. Rittman, president of the society, and Dr. E. J. Cattell, Philadelphia. Robert M. Searle, president of the Rochester Gas & Electric Corporation, was toastmaster. Demonstration of the Televox, popularly named the "mechanical man" at the last session of the convention, attracted large attendance.

Doctor Rittman Reelected President

At a meeting of the board of directors, Dr. W. F. Rittman, Carnegie Institute of Technology, Pittsburgh, was reelected president of the society. Eugene A. Rummmler, engineer, Chicago, continues as treasurer, and George C. Dent, 1815 Engineering Building, Chicago, as executive secretary. New vice-presidents at large are John Calder, Springfield, Mass., and C. H. Gullion, Swift & Co., Chicago. Albion N. Doe, industrial engineer, New York, was named vice-president in charge of promotion. Perry A. Fellows, Detroit, continues as vice-president in charge of research.

A Rochester chapter of the S. I. E. has been organized, with Virgil M. Palmer, engineer of industrial economy, Eastman Kodak Co., president.

Precise Linear Measurements Discussed

Manual and Automatic Methods Surveyed in Two Papers Before Engineers

TWO speakers took up different phases of the subject of precise linear measurements in manufacturing at a meeting held in the Engineering Societies Building, New York, Oct. 17, under the auspices of the Museum of Peaceful Arts and the Machine Shop Division of the American Society of Mechanical Engineers. Dr. George K. Burgess, director of the Bureau of Standards, Washington, presided.

In his introductory remarks, Dr. Burgess referred to the successive advances in measuring practice, from those involving only geometry to those in which electricity was a feature, and later to optical devices, in the most recent form of which measurement by means of light waves has been effected. Standards of measurement are limited both by the constancy of the material of which the standard is made—a metallurgical problem—and by temperature. Means have been developed for introducing correction of temperature variation or eliminating its effects.

International standards are somewhat hampered by lack of uniformity with regard to the temperature accepted as a basis. In the United States this is 68 deg. Fahr., equivalent to 20 deg. C. In Germany it is 20 deg. C. In England it is 62 deg. Fahr. In France many measurements have been made at 0 deg. C., although 20 deg. is in use, also. Following a recent international meeting, for the purpose

of establishing uniformity in this particular, it is hoped that a universal standard will be adopted. Dr. Burgess expressed the belief that this would be at 20 deg. C., which agrees with present American and German practice.

Development of Linear Measuring

Manual measuring devices were discussed in the first paper of the evening, which was that of Prof. James A. Hall, Brown University, Providence, R. I. Regarding linear measurements, the paper referred to the methods in use a century or more ago as giving way to the greater precision of steel rules graduated on dividing machines, which became generally available about the middle of the nineteenth century. For certain purposes these scales were replaced with plugs or gages, rings, etc., by Sir Joseph Whitworth in England. The first vernier caliper was developed by Joseph R. Brown in 1851 and the micrometer caliper by the same man, then associated with Lucien Sharpe as Brown & Sharpe, in 1867. It did not come on the market for general use, however, until 1877.

Angular measurements were served for a long time by a plain protractor, which later had vernier attachments added. The most recent development is the sine bar.

Snap gages were in use 60 years ago. They were followed much more recently by the go-no-go gages, which

have played such a great part in modern mass production.

Gage blocks of great precision developed by C. E. Johansson in Sweden were brought by him to the United States in 1907, and have become an important part of the production of the Pratt & Whitney Co., Hartford, Conn. A set of 81 of these blocks will give dimensions from 1 to 2 in. in steps of 0.001 in. and from 2 to 12 in. in steps of 0.010 in. Comparators designed for checking up on interchangeable work, etc., were first produced about 1878, and have reached a high degree of precision and usefulness. It is easy to change the setting for new dimensions, and the machine does not depend so largely upon delicacy of the operator's touch as in some other instances.

Inaccuracies of precise measurements may result from temperature changes or from a deformation of the measuring devices due to minute pressures. The speaker said that a 10-deg. difference in temperature on a length of 4 in. induces a length change of 0.00025 in. in steel.

Automatic and Optical Measurements

A second paper, devoted to the development of automatic measuring devices and the use of optical methods, was read by Prof. Earle Buckingham of the Massachusetts Institute of Technology, Cambridge. He defined the primary purpose of such instruments as being to prevent mistakes, because at high productive speed a mistake will pile up the scrap heap very rapidly. Automatic measuring instruments are those which do not depend upon the delicacy of the feel of the individual operator. They may be divided into three classes:

- 1.—Substitutes for hand measuring instruments.
- 2.—Special devices or fixtures built into an automatic machine to measure specific products.
- 3.—Sizing devices built into the machine to control the size of the product.

Describing briefly a considerable number of these devices or machines, both for use of the productive operator and for inspection, the speaker referred to inspection of measurements as a vital production process. Consequently, equipment for this purpose is deserving of the highest quality in precision. The stresses induced in such equipment are very small and must be so, and the power required to operate it is inconsequential.

Over-Emphasis on Precision

Several speakers contributed to the discussion of the paper. In particular Eric Oberg, editor of *Machinery*, New York, expressed the view that we have altogether too much demand for super-accuracy. Devices developed during the last 20 years have, of course, made possible many things not previously attainable, but the trouble is, some

people wish to have everything go to these extremely precise dimensions. The speaker expressed the opinion that there is as much waste or unnecessary expense in our manufacturing procedure, as a result of attempts to attain accuracy beyond all reasonable needs, as from carelessness resulting in work which really is unduly inaccurate for the purpose for which it is intended. He estimated at 20 per cent the shop cost of manufacturing which could be saved by the use of common sense in determining the degree of accuracy really required by the case at hand.

Specific examples were cited to give point to the general statements. Slitting cutters were ordered which were to be exact within 0.00001 in. The quotation was \$100 each. Complaint at this price resulted in a conference, at which it was found that an accuracy of 0.0001 in. would fulfill all needs, and the cutters were made for \$4 each. A ring gage was demanded with an accuracy to 0.00005 in. The quotation was \$2,500 and the manufacturer was not sure that he could make a profit on it at that figure. He knew, however, that his measuring instruments were more precise than those of the prospective buyer, and that the latter could not detect deviation within the magnitude demanded. Again a conference, caused by the high price, resulted in a change in the precision demanded to 0.00025 in. and the gage, made on the cost-plus basis, was billed at \$315. In a third case a lead screw was asked for, to be accurate to 0.0001 in. and the quotation was more than \$10,000. It developed that the screw and nut were to be furnished by the same manufacturer, and that so long as the one fitted the other accurately, the measure of precision of either was somewhat immaterial. When this view was brought to the attention of the purchaser, revised specifications resulted in production of the screw for \$315.

Exhibit of Precision Devices

Following the meeting those present adjourned to the Museum of the Peaceful Arts, at 24 West Fortieth Street, to see an exhibit made by various manufacturers and which is to be in the museum for about 30 days. An effort is being made to extend this period to cover the meeting of the American Society of Mechanical Engineers, early in December. Among the exhibits were those of the Pratt & Whitney Co., Brown & Sharpe Mfg. Co., Bausch & Lomb Optical Co., John Bath & Co., Jones & Lamson Machine Co. and the United States Bureau of Standards. In addition to block, ring, snap and other gages, there were shown a number of the high-precision machines developed in recent years, including the sine bar for measuring angles, the comparator and a number of optical instruments. The interferometer, one of the optical type, was shown by photograph.

Organization Formed for Establishing Commercial Standards

ABOUT a year ago, the Commercial Standards Unit was created by the Division of Simplified Practice, United States Bureau of Standards, to aid those industrial and commercial groups desiring to establish standards of grade and quality for their products or their purchases, or to secure relief in instances where the current variety in grades, qualities, and specifications is a burden on the producer, and a handicap to the purchaser.

The Commercial Standards Unit does not intend to write specifications but will cooperate on request with any industry in finding among existing standards and specifications those which will satisfactorily meet the commercial needs of that industry. In the event such a standard is not to be found, the Unit will assist the industry to develop one.

A "commercial standard" has been defined as a standard

for a commodity which industry wants, that is, one which the manufacturers want to produce, which the distributors want to stock, and which the consumers want to buy.

The Commercial Standards Unit functions only at the direct request of the industry concerned. Its procedure follows that of the Division of Simplified Practice, except that 65 per cent of the industry, by volume of annual production, must accept the commercial standard in writing before it is published by the Department of Commerce. Provision is made for regular revision of the standard in order that it may be kept constantly compatible with progress in the art.

Among the projects now actively considered are commercial standards for malleable iron unions, brass pipe nipples and enameled sanitary ware.

Scrap Exports Reach Large Volume

More Going to Japan Than Canada—Southern Ports the Largest Shippers—Character of Material Exported— Situation in Other Countries

WASHINGTON, Oct. 23.—The unprecedented export movement of iron and steel scrap from the United States has created unusual interest among both domestic dealers and consumers. Ordinarily shipments of old material to world markets are so small that they have no effect on the market but, whether a mere coincidence or directly related, it has been observed that domestic prices of scrap have been rising with the growing exports.

Except for an occasional dip, exports of scrap have been increasing since March, 1927, when they were only 15,416 gross tons. In August of the present year they established a record with a total of 70,538 tons. For eight months ended August, 1927, scrap exports aggregated 145,700 tons, while for the corresponding period of this year they increased to 364,776 tons and for the 20 months, January, 1927, to August, 1928, inclusive, the formidable figure of 603,985 tons was reached.

Reasons Assigned for Large Exports

Several reasons are assigned for the rise in exports of scrap. Among them are:

The disturbed situation in China, reducing shipments from that country of iron ore and pig iron.

Shutting down of iron ore mines in Sweden as the result of recent strikes.

Restrictions in Sweden against exports of scrap.

Similar restrictions in France.

Completing the recovery of scrap material from the battlefields of Europe.

Diminishing supplies of scrap in Japan.

The unsettled situation in China together with its reduced domestic supplies of scrap have been important factors in forcing Japan to reach out for new sources of old material. Japan usually draws on China for iron ore and pig iron and to some extent on Sweden and India. Some of these sources are now entirely or almost completely cut off, with no indication that they will be available again soon. Sweden for some time has prohibited the exportation of scrap and only recently extended this proclamation until March, 1929.

France has in effect a limited prohibition against the exportation of scrap, whose shipments to Italy are restricted to a basis of trade in iron and steel with Italy. The result has been that Italy likewise has had to search for new sources of supply. The clearing of the battlefields of Europe of scrap is understood to be almost at an end and to have been a factor in forcing France to reduce exports of scrap. Germany has become a larger importer of scrap. Poland and Danzig also have been affected by export prohibitions and other causes which have reduced the supplies of scrap obtained from the usual sources. China has suffered from internal conditions and, while not a large user of old material, has been compelled to go outside for supplies.

Japan, Italy, Poland, Germany and China together took 254,835 tons, or a little more than 72 per cent of the scrap exports of 364,776 tons during the first eight months of 1928. For the corresponding period of last year scrap

exports to these five countries were 84,447 tons, or approximately 57 per cent of the total of 145,700 tons exported.

Japan Taking More Than Canada

The other large consuming buyer of American scrap is Canada, generally the leading user. But during the first eight months of the present year exports of scrap to that country, 101,987 tons, were about 6000 tons less than the 107,853 tons exported to Japan, which took first rank during that period. During the eight months ended with August of 1927, Canada took 56,885 tons while Japan took only 40,936 tons. From a point of percentage increase the most notable movement of sizable tonnages were to Poland and Danzig, which during the first eight months of the current year took 53,585 tons and it is assumed that this material was consumed in Poland. It is thought unlikely that it would have moved so far east and been transshipped to Germany. During the eight months ended with August of last year, scrap exports from the United States to Poland and Danzig were only 10,300 tons.

Mexico and the United Kingdom have figured to a smaller extent than the other countries named in receiving scrap from the United States and shipments to the Netherlands have fallen to a negligible quantity, as shown in one of the tables.

Taking the nine countries dealt with, exports of scrap from the United States during the first eight months of 1928 aggregated 362,290 tons, leaving only 2486 tons shipped to other countries. For the corresponding period of 1927 these nine countries took 144,519 tons out of the total exports of 145,700, other countries taking the remainder of 1181 tons.

Government records do not disclose the grades of scrap sharing in the export movement but, except for China, the leading countries of consumption are producers of steel in bulk quantities and from this fact it is indicated that the major portion of the old material exported is heavy melting steel. China uses scrap largely for the making of knives, forks, razor blades, wire shorts and for plate cutting purposes.

Most Scrap Goes from Southern Ports

Southern ports are the source of the largest shipments of scrap. Galveston led during the first eight months of 1928, clearances aggregating 75,296 tons for the nine principal consuming countries. For the corresponding period of last year shipments to these countries from Galveston amounted to 32,427 tons. Michigan was the next most important source of scrap shipments during the first eight months of the present year. This is accounted for by the fact that the bulk of scrap exports to Canada are cleared through Michigan. The total exports through that district to Sept. 1, this year, were 73,418 tons, of which 73,307 tons went to Canada. During the eight months ended August, 1927, exports from the Michigan district were 38,799 tons, of which Canada took 38,745 tons. Exports from Florida during the first eight months of 1928 totaled 32,566 tons, of

which 13,682 tons went to Japan, the second largest American port of shipment for that country, Galveston being first with 47,346 tons. During the eight months ended August, 1927, exports of scrap from Florida amounted to only 5520 tons.

Massachusetts ranked fourth as the source of exports during the eight months of 1928, supplying 32,127 tons, of which 24,078 tons went to Poland and Danzig. Exports

United States Exports of Iron and Steel Scrap by Principal Countries of Consumption—Gross Tons			
	Eight Months Ended August		Calendar Year 1927
	1928	1927	1927
Canada	101,987	56,885	92,514
Japan	107,853	40,936	71,087
Italy	68,539	28,158	30,185
Poland and Danzig ..	53,585	10,300	14,858
Germany	18,843	2,216	9,367
China	6,015	2,937	4,067
Mexico	3,884	1,218	2,983
United Kingdom....	1,518	1,854	3,163
Netherlands	66	15	9,402
Total	362,290	144,519	237,626
All others.....	2,486	1,181	1,583
Grand total.....	364,776	145,700	239,209

from New Orleans during the eight months of the current year totaled 23,173 tons, of which 20,563 tons went to Italy. Of the 18,428 tons shipped from Maryland during the first eight months of 1928, Germany took 9171 tons, other tonnages going to Poland and Danzig, 5679 tons; to China, 1937 tons, and to Japan, 1641 tons. Sabine, Tex., shipped 13,565 tons during the first eight months of the present year, 9894 tons going to Italy and 3640 tons to Poland and Danzig. Virginia shipments during the first eight months of 1928 aggregated 12,549 tons, of which 6761 tons went to Poland and Danzig and 5699 tons to Japan. Much of the scrap from the South is said to consist of railroad material as well as steel salvaged from old buildings which have been and are being razed.

The Situation in Poland

In connection with the situation in Poland the ore extracted in that country is of low iron content and in 1927 is said to have averaged only 31 per cent, as against imported ore which averaged between 43 and 58 per cent. The practice of the Polish industry is to mix the domestic and foreign ores, but the quality of the pig iron is understood to have been unsatisfactory.

Output of iron ore in Poland, however, has increased. It rose to 538,706 tons in 1927 and 282,459 tons during the first five months of the current year, according to the Iron and Steel Division, Department of Commerce, which based its figures on reports from Consul Charles Heisler and Assistant Trade Commissioner Gilbert Redfern, Warsaw. In 1926 production of iron ore in Poland was 316,073 tons.

Imports of iron ore into Poland also have been increasing, amounting to 94,593 tons during the first quarter of 1928 and 585,172 tons in 1927, as against 273,387 tons in 1926. Similarly, the imports of scrap have risen during these years and for the first half of the current year aggre-

United States Ports Shipping Scrap Material to Nine Chief Consuming Countries—Gross Tons			
Ports	Eight Months Ended August		Calendar Year 1927
	1928	1927	1927
Galveston	75,296	32,427	45,789
Michigan	73,418	38,799	62,879
Florida	32,566	5,520	7,280
Massachusetts	32,127	6,313	8,445
New Orleans	23,173	212	295
Maryland	18,428	3,250	15,458
Sabine, Texas.....	13,565	15,769	19,754

Porto Rico.....	1,965	...	...
New York	1,698	1,500	2,690
Hawaii	1,565	2,063	2,925

gated 250,037 tons and 471,582 tons in 1927, as compared with 162,903 tons in 1926.

The future of the scrap trade is problematical, as the German-Polish convention of June 15, 1922, the terms of which provided that Germany should furnish Poland with 235,000 tons of scrap annually for five years, terminated in June, 1927, and since that date the sales of German scrap in Poland have practically ceased. In consequence where imports formerly moved overland from Germany to the Polish steel works in Upper Silesia, the bulk of imported scrap now moves through the free city of Danzig with a long and costly haul before it can be delivered to the Silesian furnaces.

Directors and Officers of Youngstown Sheet & Tube Co.
at Indiana Harbor Plant

Middle Row: J. M. Faris, assistant to vice-president; L. A. Manchester, general counsel; W. C. Reilly, vice-president; W. E. Watson, vice-president; W. B. Gillies, district manager at Chicago; C. S. Robinson, vice-president; W. E. Meub, secretary and treasurer, and W. J. Morris, vice-president.
Last Row: C. J. Ohlson, consulting engineer; A. R. Finch, general superintendent, Chicago plant; Henrik Ovesen, chief engineer; and E. S. Stillman, assistant district manager, Chicago plant.

Makes Die Castings for High Outputs

AN improved type of Lester die-casting machine has been built for its makers, the P. & R. Tool Co., Inc., Worcester, Mass., by the Reed-Prentice Corporation of that city. The machine is designed for high production of die castings, with a capacity up to 250 shots per hour, producing casting from a fraction of an ounce up to 5 lb. in aluminum and in corresponding weights in other metals. To accomplish this the machine is semi-automatic in its operation. It

of the machines at maximum production.

The operation of the machine is simple, by means of two lever handles shown at the front, one, at the left, horizontal, the other vertical. The movement of the horizontal handle brings into action the die-closing mechanism. Simultaneously, the tapered gooseneck nozzle is forced forward into its similarly tapered seat at the aperture in the adjacent die.

The vertical lever controls the air,

easily enter the narrow slots and grooves of the forming tools. The blades are 0.030 in. thick and permit measurements to be taken in slots or grooves up to 7/32 in. deep. By the use of this micrometer, the diameter of forming tools can be accurately measured and the depth of forms and grooves determined. It is available in sizes for measuring from 1 to 4½ in. by thousandths of an inch.

Chamfering Machine for Gear Teeth

FOR chamfering and rounding teeth of gears to promote easy engagement or meshing, as in the case of transmission gears in automobiles, the City Machine & Tool Works, 1517 East Third Street, Dayton, Ohio, has brought out a new Peerless tooth chamfering machine, motor-driven, with motor installed in the base.

The standard machine, such as that here shown, will accept gears up to 10 in. in diameter, although the capacity can be increased materially, it is emphasized, by slight alterations in manufacture. Operation time is put

By the Lever at the Left the Dies and Metal Connection Are Set and by the Lever at the Right Metal Is Forced by Air into the Dies

is furnished in four sizes, that shown being the smallest.

A chief change in the design from previous models lies in the mechanism which provides the automatic filling of the gooseneck which dips the molten metal from the furnace and delivers it under high air pressure into the dies. The die-closing toggle mechanism is hydraulically operated by oil and with a delivery of 3000 cu. in. of oil per minute will develop 15 cycles with a low consumption of power. The builders state that a 10-hp. motor will easily operate three

which forces the hot metal from the gooseneck into the dies to form the casting. The gooseneck is not connected with the high-pressure line when the dies are open, thus to eliminate danger or accident from this source.

The reverse action of the vertical lever throws off the air and the reverse action of the horizontal lever opens the dies. An ejector plate automatically removes the cooled casting and the cycle of operation is completed. The picture shows the machine without dies in place.

Micrometers for Measuring Forming Tools

TWO micrometers for checking the accuracy of forming tools have been brought out by the Brown & Sharpe Mfg. Co., Providence. One of the instruments, shown at the right in the illustration, is provided with ½-in. diameter disks on its anvil and spindle end to permit taking measurements in places inaccessible to regular micrometers. The disks are

1/16 in. thick in the center and 0.020 in. thick at the outer edge. The measurement of a form up to ⅜ in. deep and over 0.020 in. in width can be taken with this micrometer, which is furnished in one size for measuring 0 to 1 in., by thousandths of an inch.

The thin blade ends of the anvil and spindle of the micrometer caliper shown at the left in the illustration

Accuracy of Forming Tools May Be Checked Conveniently

Peerless Gear-Tooth Chamfering Machine Has Inclosed Motor

at 45 teeth per minute, depending on the required pitch and form, although the makers say that greater speeds have been attained. Changing to gears of different sizes is a matter of a few minutes, and pitch change requires slightly longer time. The picture shows the set-up on rounding the corners of external teeth, but by a slight shift it can likewise be employed for rounding internal teeth. The machine is offered to work to close mechanical tolerances at speeds limited only by cutter endurance. Timken roller bearings are employed to assure smooth chatterless operation, and generous proportions are counted on to eliminate vibration.

The area of the base is 26 x 36 in., the overall height is 49½ in., and the net weight is 1800 lb.

Full-Floating Flexible Coupling

A NEW type of flexible coupling is announced by the T. L. Smith Co., Milwaukee. It is known as the Flex-Ring full-floating coupling and in design approaches the universal joint with a shock-absorbing member

set between shafts, end play of shafts and shock. The Flex-Ring is designed to handle these conditions even when present to an excessive degree.

Torsional load is transmitted through one or more ring-shaped springs made of alloy steel. It is said that these springs are not subjected to any wear from endwise motion of the shafts, nor from angular or offset misalignment, since they are confined in a housing eliminating all motion except opening and closing under stress. In a reversing drive it is not necessary to increase the size of the coupling, as there is no reversal of stresses in the torque elements.

The coupling has been used on compressors and other units since 1924. About a year ago the company gave it a severe test on one of its own boring mills where the shaft had an offset of $3/32$ in. The test was continued throughout the year and at times the mill was purposely overloaded as high as 90 per cent. After a year's use under these extreme conditions, the Flex-Ring is said to be still in perfect condition.

Torsional Load Is Transmitted Through Ring Shaped Springs Made of Alloy Steel

added. It is claimed that it compensates for all possible conditions existing in a direct drive, such as angular misalignment of shafts, off-

Tilted Offset Milling Machine

TWO views are shown of a new 28-in. tilted offset miller, built by the Oesterlein Machine Co., Cincinnati. Its design incorporates the same general principles of offset milling as

starting point. Many parts are undercut at the same time. The feed automatically decreases in the bottom of the cut.

The 28-in. unit is intended for use on milling operations on screws and bolts, such as flattening the heads of connecting rod bolts, slotting screws, milling small clevises and yokes, sawing, and straddle and face milling of small parts. Because the production

Continuous Cutting Is a Feature of This Tilted Offset Miller

are used on the 48-in. machine. Relatively large cutters, completely surrounded with work, the two centers of which are offset from each other to obtain the proper depth of cut, form the basis around which the design of these machines has been developed.

Among advantages claimed for the machine is the fact that cutting is continuous—there is no returning to

on such work by the offset process is limited only by the number of parts an operator can handle, means are provided in the work-holding fixtures for automatically clamping, unclamping and ejecting the parts, thereby leaving the operator's entire time for loading. Such a fixture is illustrated.

Some of the features of the machine are as follows:

Provision for the use of 20 gal. of coolant a minute,

A large chip basin within the base,

Frictionless bearings throughout, including spindle,

Relatively care-free lubrication system,

Heat-treated, multiple, splined gears and shafts throughout,

Adaptability to the use of automatic fixtures.

The machine has an 18-in. diameter table, swings 28-in. diameter, allows 14 in. from table to outboard arbor bearing, uses $2\frac{3}{4}$ -in. diameter arbor, weighs 2600 lb. net, and is driven by a 3-hp. 1800 r.p.m. motor mounted on the back of the machine, connected by chain with the driving sprocket.

Inclosed Electric Motor Fan Cooled

FULLY-INCLOSED fan-cooled induction motors are made by the Reliance Electric & Engineering Co., Cleveland. They are made in sizes of $1\frac{1}{2}$ hp. to 40 hp., but for the larger sizes a so-called skeleton frame motor is used, one of which is shown in the accompanying cut.

As is generally apprehended, motors of this type may be used in places subject to great quantities of mill dust and dirt, and at the same time may

be smaller than otherwise would be the case were measures not provided for the internal cooling of the motor parts, let alone keeping open the magnetic gaps within the motor.

A single exhaust fan is mounted on an extension of the shaft in the case of the Reliance construction outside the front bearing bracket. The external cooling air is drawn in through openings at the center of the back bearing bracket. The air passes over the radiating bonnets and stator and is exhausted at the front end, with the protection of heavy netting, as shown. For those desiring further particulars, the company has prepared a small catalog containing sectional drawings of both the skeleton frame and the riveted frame motor.

German Mills Threaten Wage Lockout

British Foresee Advantage from German Suspension—Welsh Tin
Plate Mills Resume Output Restriction

(By Cable)

LONDON, ENGLAND, Oct. 22.

CLEVELAND pig iron is quiet as most of the output is going to local steel works and supplies for sale in the open market are limited. The threat of a lockout in Germany, early in November, is considered as a possible favorable development for British producers.

Stocks of hematite iron have almost all been absorbed and supplies for early delivery are expected to be scarce. Buyers are consequently endeavoring to cover their future requirements and output may be increased. Foreign ore is quiet as German consumers have covered most of next year's requirements.

Imports of steel into Britain are larger, but new buying is light. Finished iron and steel is unchanged. The shipbuilding industry continues depressed. The Clyde Shipbuilding Co. is closing its Port Glasgow yard and dismantling it. Day, Summers & Co. are closing their Southampton works. Lloyd's Register for the quarter ended in September reveals a decrease in British tonnage under

construction of 112,000 tons, compared with the end of the second quarter, and 447,000 tons compared with the third quarter of last year. Compared with the third quarter of 1927, Clyde shipbuilding declined 28 per cent and North East Coast building 47 per cent.

Tin plate is quiet. Welsh makers have agreed to increase the restriction of output for 13 weeks beginning at the end of November, to offset the shortage of orders for the rest of this year. All mills will close for three weeks during that period. Prices for forward delivery are firm, many makers having sold half their production for the first six months of 1929.

Galvanized sheets are quiet but prices are steady. Merchants have sold Japan thin-gage black sheets for November-December shipment.

Continental markets are quiet, with but little buying by British consumers and overseas markets and prices are consequently easier. The International Wire Rod Cartel meets in Luxemburg, Oct. 26, when it is expected that prices will be advanced and the cartel renewed for another six months from the end of December.

increase of 15 pf. per hr. The employers offered minor concessions, which would have increased the wages of about 2000 of the 225,000 workmen affected, but these proposals were refused. The Labor Unions will probably request arbitration, and under the law the Government has authority to make a decision binding on both parties. Steel wages were last advanced at the beginning of this year, but by only 2 pf. per hr. Should wages be increased materially, syndicate domestic prices will be advanced. At present prices are unchanged, but the syndicates show reserve in concluding new contracts for future delivery. A strike involving 50,000 workmen is in effect at North Sea and Baltic shipyards.

Domestic and export markets are quieter than at the beginning of the month. In September, for the first time since February, 1927, pig iron output was less than 1,000,000 tons. The percentage of production by Rhenish-Westphalian furnaces in the first three quarters of 1928 is but little less than the output in the same months of 1927, but there a sharp decline appears in the production of Silesia and of the Siegerland-Lahn-Dill districts. The total German pig iron production in the first nine months was 9,638,384 metric tons, compared with 9,694,106 tons in the same period of 1927. September output was 985,413 tons, compared with 1,104,658 tons in September, 1927. The number of furnaces in blast at the end of September was 99, against 116 at the beginning of the year. Domestic pig

German Lockout in November

Wage Increase in Steel Mills Refused but May Be Arbitrated—Export and Domestic Trade Quiet

BERLIN, GERMANY, Oct. 13.—Throughout the northwestern iron and steel industry notice has been posted

of a lockout effective Nov. 1. Employees have denounced the existing wage agreement, and demanded an

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works with American equivalent figured at \$4.86 per £ as follows:

(a) Nominal.

iron prices have been weaker, and less tonnage is going to foundry consumers. While pig iron in the international market has been firmer, there has been no reflection of this strength in Germany.

In semi-finished products the greatest domestic demand is for billets. The market for slabs is quiet. Sheet rolling mills report declining sales. Demand from the shipyards and from boiler manufacturers is smaller. Foreign buying of tubes has declined and producers are operating not more than 60 per cent of their capacity. The domestic market for bars has been quiet since the beginning of the month, so that German mills are able to execute export orders promptly and obtain slightly higher prices than other Continental producers. As much as £6 8s. per ton (1.41c. per lb.) f.o.b. is quoted today while in the fall of 1927 export bars sold at £4 12s. to £4 13s. (1.01c. to 1.02c. per lb.). Mills are now obtaining £1 15s. (\$8.50) per ton more for exports than a year ago, but domestic prices have advanced only 7 m. (\$1.67) per ton. The iron and steel foreign trade balance continues to improve.

The quarterly report for Sept. 30, of the Vereinigte Stahlwerke A. G., Düsseldorf, reports orders in hand at only 68.1 per cent of the volume of September, 1927. Output of coal, coke, pig iron and steel in the third quarter exceeded the second quarter.

A recent official inquiry into German mining as compared with before the war shows the total value of mine output in 1927 as 2,930,000,000 m., which is 39 per cent greater than in 1913 within the present frontiers. Even allowing for higher prices, 31.9 per cent for this group of commodities, the value exceeds the pre-war. Compared in tons, coal output in 1927 exceeded the pre-war by 9.1 per cent, lignite by 72.5 per cent. Iron ore output declined by 9.3 per cent and zinc output increased by 17.6 per cent.

German Tin Plate Mills Get British Orders

HAMBURG, GERMANY, Oct. 7.—The Welsh-American tin plate agreement has brought about a rather unusual situation in export trade. British exporters of tin plate in London, Manchester, Liverpool and Glasgow who are unable to supply their customers in foreign markets have sent numerous inquiries to German makers. German makers, who exported a total of 300 to 500 tons of tin plate a month prior to the war, have been shipping about 3000 tons monthly this year, and trial orders that they now have from British exporters are expected to increase this total considerably. In the past practically no German tin plate has been sold in South and Central American countries or in Canada, the German markets being the Scandinavian countries, Portugal and Italy. The trial orders from British exporters are for shipment to Canada and South American markets.

Tube Cartel Maintains High Prices

Consumers in Europe Object to High Domestic Market and Seek Pipe in Britain, Holland and United States

DÜSSELDORF, GERMANY, Oct. 4.—An example of what may occur when a combination of producers controls a product internationally is afforded by the International Tube Cartel. Domestic and export prices of tubes are fixed by the cartel in France, Belgium, Germany, Czechoslovakia, Luxembourg, Hungary, Poland and the Saar. Exports of tubes from one member country to another are not permitted by the association, so that domestic prices in these countries are maintained at a high level, despite complaints of consumers.

As an example of the high domestic prices that can be maintained by such an association of producers, the difference between the German domestic and export prices is at present 70 to 80 m. (\$16.66 to \$19.04) per ton, while in the bar market there is a difference of only 17 m. (\$4.05) per ton. Consumers, in charging that the high prices quoted by the tube makers are unjustified, cite a recent sale of tubes, totaling about 2,000,000 m. (\$476,000), made on reparations account to the French railroads by a small outsider, the Röhrenwerke at Bielefeld. The price of the seller was

30 per cent lower than the quotations of members of the association.

It was claimed by the tube cartel that the seller would undoubtedly incur a loss from this order unless inferior material were furnished. Tests of tubes delivered to the French railroads showed the material to be satisfactory, and, following the order, shares of the company advanced 20 per cent in the stock market.

There are two European countries not members of the tube cartel, Holland and Great Britain. Although British prices are high, Stewarts & Lloyds, Ltd., Glasgow, is disposing of substantial quantities of tubes through merchants in Cologne, and the Dutch works, Staalwerke de Maas, Maastricht, which started producing tubes in September, has established offices in Germany and is under-quoting the cartel. Merchants are inquiring for tubes from makers in the United States and, despite the tariff and high American prices, it is believed that the present level of the German tube market would permit business to be done with buyers at seaports, such as Hamburg, Bremen and Stettin.

Less Foreign Competition in Britain

Pig Iron More Active—Tin Plate Mills Full—Dock at Singapore Expected to Require Large Steel Tonnage

LONDON, ENGLAND, Oct. 12.—With the approach of winter, iron and steel makers are beginning to take stock of their position. Foreign competition has been curtailed to some extent by the recent upward movement in Continental prices, although there have been few reductions in British quotations. Rather, the tendency among British producers is to ask higher prices on most products.

Pig iron is slightly more active. It no longer pays to import foreign material, so that consumers have been paying more attention to domestic sources of supply. There is keen competition among the various producing districts. The Scottish Light Castings Association, at the beginning of this year, placed a substantial contract for foundry iron with Cleveland furnaces, but those producers, through their reluctance to make a concession in price, have lost the renewal of the contract, which has gone to Midland furnaces at about 2s. (48c.) less than the Cleveland figure.

Conditions in the hematite market are better. Export users are returning to the use of British material, and some desirable business has been placed for both domestic and overseas shipment. Stocks of hematite are still

fairly large, but they are being reduced, and if the present demand is maintained it will be necessary to blow in additional furnaces.

A considerable amount of activity has developed in semi-finished material, as a consequence of the high prices and extended deliveries ruling on Continental steel. Welsh sheet bar makers, in particular, have sold many thousands of tons to the tin plate mills and are now asking a 2s. 6d. (60c.) per ton advance for delivery next year.

The one weak spot in finished material is the heavy plate market. New shipping contracts are meager and there is practically no export demand. Consequently mills find it difficult to secure sufficient tonnage to enable them to operate more than part time. Current shipbuilding is fairly active and a good number of vessels have been launched recently, but the volume of new business will not replace the orders being completed.

Sheet and tube mills are moderately active, tin plate mills are assured of good business for next year, and in certain branches of construction and engineering work domestic demand will keep steel plants well occupied for several months. There are also some

important contracts for new bridges in foreign markets. The releasing of the Admiralty contract for the erection of the new Singapore Dock will result in the placing of large orders for reinforcing steel. Ordinary merchant business for export continues very quiet.

European Rail Prices Weaken

HAMBURG, GERMANY, Oct. 6.—Despite optimistic reports, the European Rail Makers' Association is said to be on the point of being dissolved. It is common knowledge among Continental producers that the British members have been selling a larger tonnage of rails than is specified in their allotment, at the same time opposing all efforts of the association at restriction. Consequently, some of the larger Continental mills in France and the Saar oppose continuation of the association.

Early dissolution is not expected, but evidence of lack of control ever members is accumulating. Some rail producers, believed to be in France, Luxemburg and the Saar, are selling through merchants at £6 8s. 9d. to £6 9s. (\$31.29 to \$31.35) per ton, f.o.b. Antwerp, although the official selling price is £6 10s. (\$31.59) for Thomas steel rails. This is the first time in the two years of the association's existence that concessions from official prices have been reported. The rail association is the only all-inclusive syndicate of European and British producers.

British Government Buys Wire Abroad

HAMBURG, GERMANY, Oct. 6.—A contract for \$310,000 worth of telephone and telegraph wire has been placed by the British Postal Department with the German Wire Makers' Association. This is the second large wire order placed with a foreign maker by the British Postal Department, the first, totaling \$190,000, having gone to the Trefileries du Havre in France last September. These are the first large orders placed abroad by this department since 1914, and the reason given is that British wire makers established a pool to maintain high prices for these contracts.

Foundry Equipment Orders Decline

Bookings of members of the Foundry Equipment Manufacturers Association declined in September, but were larger than for any other month this year except August and May. The index of both gross and net orders for 20 companies was 170, using average monthly shipments for the years 1922, 1923 and 1924 as a base of 100. The index of orders in August was 278. The index of shipments in September was 129.7, compared with 154.1 in August. Unfilled orders at the end of September stood at 529.7, compared with 467.2 a month previous.

To Discuss Machinery Trade Problems

Conference Called at Washington of Representatives of Machinery and Equipment Associations to Correct Uneconomic Practices

ON the request from secretaries of several of the associations in the machinery field, a conference of machinery and equipment trade associations was called by Hugh P. Baker, manager Trade Association Department, Chamber of Commerce of the United States. The meeting was held at Montauk Point, Long Island, N. Y., Sept. 29. E. F. DuBrul, general manager National Machine Tool Builders Association, was elected chairman, and Philip P. Gott, assistant manager Trade Association Department, Chamber of Commerce of the United States, was elected secretary of the conference.

Among the uneconomic practices discussed were the following: Wasteful buying; misrepresentation of materials; free engineering service; holding patterns for unlimited period; unlimited maintenance service.

A second conference has now been called for Thursday, Nov. 8, at 10 a.m., at the Chamber of Commerce of the United States Building, Washington, to give further consideration to the subjects of the first conference and also unfair competitive practices, unknown costs of doing business and obsolescence. W. H. Rastall, chief of Industrial Machinery Division of the Bureau of Foreign and Domestic Commerce, and H. C. Dunn, Domestic Commerce Division of the Department of Commerce, will outline further possible subjects which may be considered by this conference group.

The classifications and schedules which the Census Bureau will use in the special survey at Cleveland will be mailed to secretaries, and suggestions relative to these will be considered.

Those present at the first conference were as follows:

Harry Botsford, Society for the Development of Internal Combustion Power, Titusville, Pa.

J. R. Boyd, National Crushed Stone Association, Earle Building, Washington.

C. W. Conner, American Road Builders Association, 914 National Press Building, Washington.

C. R. Dimm, Flour Mill Machinery Manufacturers Association, care of Robinson Mfg. Co., Muncy, Pa.

E. F. DuBrul, National Machine Tool Builders Association, 826 Provident Bank Building, Cincinnati.

E. P. Essley, Associated Machine Tool Dealers, 551 Washington Boulevard, Chicago.

Charles M. Haskins, National Association of Waste Material Dealers, 1109 Times Building, New York.

W. S. Hays, Power Transmission Association, Drexel Building, Philadelphia.

C. B. LePage, American Society of Mechanical Engineers, 29 West Thirty-ninth Street, New York.

Verne E. Minich, American Foundry Equipment Co., 366 Madison Avenue, New York.

R. M. McClure, National Laundry Allied Trades Association, 111 West Washington Street, Chicago.

John W. Ogren, Elevator Manufacturers Association of the United States, 407 Conway Building, Chicago.

H. C. Dunn, Domestic Commerce Division, Department of Commerce, Washington.

R. M. Hudson, assistant director, Bureau of Standards, Washington.

W. H. Rastall, chief, Industrial Machinery Division, Bureau of Foreign and Domestic Commerce, Washington.

Philip P. Gott, assistant manager, Trade Association Department, Chamber of Commerce, Washington.

Mr. Rastall called attention to the fact that, according to the income tax report for 1924, 51.8 per cent of the firms reporting classified under "Machine, Tool and Metal Working Machinery" reported no profit.

Mr. Dunn pointed out that the changes in style constitute serious problems for the machinery industry. Do the machinery manufacturers and users realize, it was asked, that the life of a machine is not only determined by its productive ability but by the desire of the ultimate consumer to purchase the products of that particular machine. The Domestic Commerce Division upon request of the machinery industry may make a survey of the obsolescence of machinery.

Italian Ministry Suggests Closing Some Steel Plants

The Italian Ministry of Economy reports that the 60 steel and iron works in the country are producing at only about 50 per cent of their maximum capacity. The ministry suggests that the same tonnage of finished iron and steel could be produced at lower cost if half these works closed and only the largest and most modern continued operations.

Closing these plants would throw several thousand men out of work, but the consequent decrease in the cost of finished steel and iron, it is believed, would create employment for some 10,000 engineering workers.

The manufacturing interests of Italy are at present hampered by a heavy duty on foreign steel and iron, which forces up prices in Italy, and by Government pressure on employers to retain more workers than are necessary to meet present demands.

Half of Immigrants from Canada and Mexico

WASHINGTON, Oct. 20.—Immigrants admitted to the United States in August totaled 24,629, of whom 12,970 were males and 11,659 were females, according to the Bureau of Immigration. Emigrants leaving the United States in August were 6488, of whom 4062 were males and 2426 were females. Canada, with 6104, led in the number of emigrants to this country, followed by Mexico with 5557. From overseas, Germany contributed the largest number, 2782. The Irish Free State sent 1395; Italy, 1538; Great Britain, 1197, and the Scandinavian countries, 1302. Countries of eastern Europe sent 2264 immigrants.

Science Applied to Open-Hearth Practice

Pittsburgh Conference Listens to Exposition Made in Non-Technical Terms—Abnormal Steel Studied

PRACTICE sat at the feet of theory at the second open meeting of the Metallurgical Advisory Board to Carnegie Institute of Technology and the United States Bureau of Mines in Pittsburgh, Friday, Oct. 19, when Dr. C. H. Herty, Jr., physical chemist United States Bureau of Mines, gave a progress report on plant research on 40, 90 and 250-ton open-hearth furnaces. In the simplest language and by lantern slides remarkable for their clearness, he provided an entirely understandable explanation of the elimination of non-metallic inclusions from open-hearth steel. This report, easily the outstanding event of the gathering, showed how to determine whether a heat of steel was to be killed or reboiled. The author was commended further for having written something that the non-technical man of the open hearth might understand, particularly since so much that has been written previously has lost its effectiveness because the man in the shop cannot interpret, let alone apply it. Discussion by the 150 or more men present did not cease with the completion of the afternoon session, but extended informally throughout the dinner at the Pittsburgh Athletic Association.

Like the first open meeting held in Pittsburgh about a year ago, Friday's conference gathered a group of those interested in metallurgy from both a practical and an educational standpoint. As explained in *THE IRON AGE*, Oct. 27, 1927, page 1171, the metallurgical advisory board supervises a joint research activity. United States Bureau of Mines contributes one-half the cost of the work, while Carnegie Institute of Technology supplies one-third and the remainder is contributed by steel makers who will benefit by the results.

F. N. Speller, director of metallurgy and research National Tube Co., Pittsburgh, is the new chairman of the board, succeeding T. D. Lynch, consulting metallurgical engineer Westinghouse Electric & Mfg. Co., East Pittsburgh, who has filled that office for the past three years. G. A. Reinhardt, chief metallurgist Youngstown Sheet & Tube Co., Youngstown, Ohio, was elected vice-chairman, succeeding Dr. Earl Blough, technical director Aluminium, Limited, Pittsburgh.

In the morning Dr. V. N. Krivobok, associate, Bureau of Metallurgical Research, Carnegie Institute of Technology, presented an illustrated report on case carburizing research. He observed that it had been necessary to attack the problem from chemical and physical bases and determine the rate of diffusion and the distribution and size of non-metallic inclusions. He also reviewed effects of the different alloys upon the normality of the steel. Dr. H. W. Gillett, chief division of

metallurgy, United States Bureau of Standards, Washington, agreed with Dr. C. H. Herty, Jr., that oxygen has an important influence upon abnormality. He thought the plan of research was good, but warned that the problem was complex and the research likely to be long. M. A. Grossman, metallurgist Central Alloy Steel Corporation, Canton, Ohio, thought the way to the answer was in separating the variables, since the depth of the case is the same in normal as in abnormal steel.

Dr. F. M. Walters, Jr., director Bureau of Metallurgical Research, Carnegie Institute of Technology, mentioned the need of a pure manganese as a primary step in the study of steel and illustrated by lantern slides a furnace for making manganese metal 99.94 per cent pure, with the possibility of further refining to 99.99 per cent. This development will be described at length in a forthcoming issue.

Improved Uses of Coal and By-Products

A second international Conference on Bituminous Coal will be held at Carnegie Institute of Technology, Nov. 19 to 24. More than 100 speakers, representing 12 nations, will take part. Features on the program include:

Monday, Nov. 19. "Coal Problems in Perspective," by Lord Melchett (Sir Alfred Mond), London, England, and a session on low temperature distillation.

Tuesday, Nov. 20. "Coal, Hydrogen and Capital," by F. zur Nedden, Berlin, Germany, and a conference on pulverized fuel.

Wednesday, Nov. 21. "From Coal to Rubber," by Prof. Fritz Hofmann, Breslau, Germany, and a conference on purification and cleaning of coal.

Thursday, Nov. 22. Sessions on the liquefaction of coal and on combustion for power.

Friday, Nov. 23. "Some Thoughts of an Inventor on Scientific Research and Inventions," by Georges Claude, Paris, France, and conferences on gas.

Billings & Spencer Co. to Be Reorganized

The Billings & Spencer Co., Hartford, Conn., maker of drop forgings, tools and drop forging machinery, will soon submit to stockholders a plan for the reorganization of the company, contemplating the issuance of 105,000 shares of \$10 per value stock in substitution for present outstanding preferred and common stocks, the elimination of bonds with accrued interest and the payment of the company's outstanding bank loans. The plan has received the approval of directors and a syndicate of bankers has underwritten the proposed new stock issue.

David J. Post has been elected chairman of the board of the company, a newly created office. He has been a director in the Billings & Spencer Co.

for a number of years and is also chairman of the Hall-Thompson Co. and of Veeder-Root, Inc., both of Hartford. Other officers of the Billings & Spencer Co. are Frederic C. Billings, president and treasurer; A. H. Deute, vice-president and general manager, and C. T. Smith, secretary and assistant treasurer. Messrs Billings, Deute and Post and Richard J. Goodman, Edward Milligan, Lucius F. Robinson, Nelson Smith and L. Edmund Zacher will constitute the board of directors of the new company.

Pacific Coast Steel Interests Confer

More than 140 executives connected with the iron and steel industry in California met at the Hotel Whitcomb, San Francisco, Oct. 12, to attend the Northern California Regional Conference of the Iron, Steel and Allied Industries of California. Group meetings, representing merchant bar jobbers, steel mills, structural steel fabricators, foundries, general manufacturers and reinforcing steel bar jobbers, were held in the morning. Following a luncheon, resolutions affecting the industry on the Pacific Coast were presented to the executive committee for further consideration. The fifth annual conference will be held at Del Monte, Jan. 24 to 26.

Call to Meet on Shafting Standards

The sectional committee on the Standardization of Shafting will hold a meeting at the headquarters of the American Society of Mechanical Engineers, New York, Oct. 31, at 10 a.m., to consider the revision of certain standards developed by the committee some time ago. The proposed American Standard Woodruff Key dimensions which has recently been approved by the sub-committee will be considered. At this time eleven national organizations have been requested to appoint an official representative to serve on this sectional committee.

Plant to Make Carbology Cutting Tools

Carbology Co., Inc., is reported to be planning the construction of a new plant at or near Schenectady, N. Y., for the manufacture of metal and carbide alloys, to cost more than \$150,000 with equipment. The company was formed recently with a capital of 7000 shares of stock, no par value, by P. R. Mallory and interests identified with General Electric Co. Mr. Mallory is head of P. R. Mallory & Co., Inc., 350 Madison Avenue, New York, manufacturer of tungsten products, with plant at Port Chester, N. Y. Carbology is the trade name of a new tool material featured at the Steel Treathers' Exposition in Philadelphia earlier in the month, and described in the last issue of *THE IRON AGE*.

New Card of Extras on Hot-Rolled Strip

The Sharon Steel Hoop Co., Sharon, Pa., has announced a new card of extras on hot-rolled strip steel. As nearly all contracts for the fourth quarter have been closed on the old basis, the new extras, though immediately effective, probably will not apply to much tonnage until the first quarter of 1929. The company states that the extras are the result of more than a year's study of production costs of various widths and gages.

"In the card which has been in general use for some years," says the company, "the extras on the quite narrow sizes were so low in relation to costs as to make it unavoidable that a high base price be quoted to secure any profit on these small, light sections. On the wide sizes, the old card was thought to be consistent with mill practice of some years ago, when it was difficult, and, in some cases, impossible to roll wide sizes in light gages. All wide sizes in the usual strip gages were then expensive and troublesome to roll and therefore took high extras. Today's practice is such that large numbers of mills produce the wide sections much more economically than formerly, so that practically no regard has been given to the list of extras on the wide sizes. These practices have caused confusion and demoralization, and have, to a great extent, destroyed the usefulness of the old card.

"Our new card of extras, we believe, will overcome these difficulties and will be to the advantage of both buyer and seller in permitting a uniform base price to be built up under the new card of extras. If this should be

the result, it will permit the trade to have the same knowledge of the market situation as to strips as now pertains to bars, plates and other standard hot-rolled steel products."

The old card of extras failed to take into consideration the pickling costs on all sizes 1 1/2 in. and wider. The new card has three divisions of pickling extras, one on sizes under 1 1/2 in., another on sizes from 1 1/2 in. to 6 in. and a third on 6 1/16 in. to 24 in.

It is said that other manufacturers are preparing to adopt the same card.

National Advertising for Steel Advocated

"The steel industry is the only large and important industry that has failed to seek the benefits of a national advertising campaign to educate the public as to merits and advantages of steel," said Charles F. Abbott, executive director American Institute of Steel Construction, in an address on Oct. 16 to the Advertising Club of Washington. "Unfortunately, there are a few leaders of this industry who still seemingly refuse to believe that advertising pays."

"It is to be hoped," he said, "that the time is not far distant when the steel industry may undertake a national advertising campaign to promote public education as to steel. No investment could be made offering greater opportunities for profit than that of a properly conducted national advertising campaign to win public support and thereby extend the consumption of steel, particularly in bridges and buildings, where public influence is frequently evident.

"The industry which grasps the full meaning of the new form of competition and adapts its policies to meet it will inevitably outstrip those which are unable to recognize the change that confronts them, or which fails to place the proper valuation on public opinion as the controlling factor in industrial progress."

Sheet Sales in September 370,936 Gross Tons

Sales of steel sheets showed a sharp gain in September and were greater than during any previous month of the year except March, according to the monthly report of the National Association of Flat Rolled Steel Manufacturers, Cleveland. Sales in September were 370,936 gross tons, compared with 254,397 tons in August. Production last month amounted to 318,907 tons and shipments were 322,876 tons, both falling off slightly from the previous month. Unfilled orders, which on Oct. 1 amounted to 539,960 tons, showed a gain of 40,000 tons over those of Sept. 1. The September report and comparisons follow:

	Sept.	Aug.	July
Total number of mills	721	721	721
Capacity per month	450,500	506,000	464,422
Percentage re- porting	70.1	70.1	70.1

Urges Distributers to Extend Sheet Uses

Metal Branch of American Hardware Association Hears Favorable Reports on Progress of Simplification

THE opportunity offered distributers to extend the use of sheet steel products was emphasized by George H. Charls, president National Association of Flat Rolled Steel Manufacturers, Cleveland, in an address before the Metal Branch, National Hardware Association, meeting at Atlantic City, N. J., Oct. 16. Mr. Charls dealt at length with the future possibilities of sheet steel and told of the work being done by the Sheet Steel Trade Extension Institute to bring out these potentialities. The distributer, he pointed out, is in a splendid position to realize considerable profits by following up the work already done and helping to broaden the market for sheet products. A considerable part of the increase in sheet steel consumption is already being taken up by demands from new sources and this, according to Mr. Charls, is only demonstrative of what may follow if the work is continued

Market Conditions Good

B. C. McMahon, Bethlehem Steel Co., Bethlehem, Pa., spoke briefly on market conditions throughout the steel industry with special emphasis on sheets and tin plate. Although there has been a slackening in the demand for tin plate in recent weeks, he stated that the storm in Florida and the West Indies would occasion a considerable decrease in the pack of canned goods this season and probably lead to a very heavy pack in 1929, thus pointing to a good year for tin plate.

Discussing conditions in the sheet industry, he said that prospects looked better now than had been the case for several months. Mills are running at a high rate and deliveries have been extended. Prices, which until now, have been the most unfavorable factor in the industry, have improved somewhat, but there is still room for considerable advance. Distributers, he emphasized, are very important factors in sheet consumption, particularly of the galvanized product, and will continue to grow more important as the uses of this product grow more diversified. In spite of low prices, however, he said that the steel industry has kept wages at a high level, the average weekly pay envelope for the industry as a whole averaging \$33.87, as compared with \$27.30 for a group of 20 other important industries.

Reports Progress in Roofing Simplification

In the report of the sheet steel simplification board of review, W. L. Latta, Wheeling Steel Corporation, Wheeling, W. Va., chairman, stated that the Department of Commerce schedule No. 28, referring to sheet

steel had been reaffirmed and that schedule No. 78 on galvanized roofing had been improved upon. A representative of the Department, who was present at the meeting, stated that over 94 per cent of the manufacturers of sheet steel now adhered to the standard sizes specified.

Louis Kuehn, Milwaukee Corrugating Co., Milwaukee, presenting the report of the eaves trough and conductor pipe board, stated that the association had been successful in securing the adoption of 28 gage and heavier as the minimum weight for eaves trough. He stated that 96 per cent of the distributers in the country had adopted this standard.

The protest of the distributers to the lower discounts on sheets recently adopted by the mills was discussed in THE IRON AGE last week, page 970.

Plans for Third World Foundry Congress

During the past winter the committee on international relations of the American Foundrymen's Association has been engaged mainly on preliminary arrangements for the third International Foundrymen's Congress which will be held in London, June 11-15, 1929, under the auspices of the Institute of British Foundrymen. The first international congress was held in Paris in September, 1923; the second was held in Detroit in September, 1926.

Officials of the Institute of British Foundrymen will be hosts to the 1929 congress. Plans which have been agreed upon provide for the American delegation leaving New York either May 11 or 15, 1929, in order to arrive in England in time for a three weeks' sight-seeing pre-convention tour of England and Scotland, which will include several days in London prior to the opening of the congress on June 11. Important British foundry centers will be visited.

At an early date Thomas Cook & Son, the official travel agent of the tours, will submit a recapitulation of the pre-convention and post-convention trips for the committee's final approval and when approved it will be submitted to the A. F. A. members. If, in the meantime, anyone desires further information as to accommodations, rates, etc., he should write to Thomas Cook & Son, 585 Fifth Avenue, New York.

During the week of the congress itself in London what is expected to be the largest exhibition of foundry and shop equipment ever held in Europe will be staged under the auspices of the British foundrymen's organization. At the sessions of the congress papers will be read and discussed by the

world's most prominent foundrymen.

Since the announcement of the tour at the Philadelphia convention of the American Foundrymen's Association, a surprisingly large number of foundrymen have made inquiry as to details regarding the tour, indicating that marked interest is being displayed. Accommodations will be limited, especially for the pre-convention tour of Great Britain.

Awards to Hoover the John Fritz Medal

The John Fritz gold medal, the highest honor bestowed by the engineering profession of this country, has been awarded for 1929 to Herbert Clark Hoover, it is announced by the Engineering Foundation, 29 West Thirty-ninth Street, New York.

"The choice of Mr. Hoover," according to the announcement by Alfred D. Flinn, director of the foundation, "ended a process of selection begun a few years ago. The award was tentatively made a year ago by the John Fritz Medal Board, which is composed of 16 recent past presidents of the four national societies of civil, mining and metallurgical, mechanical, and electrical engineers, having together a membership of nearly 60,000. By this award, which was unanimous, the board sought to express the high appreciation of Mr. Hoover's professional brethren for his distinguished attainments as an engineer, particularly in mining operations in this and other countries, and his great services as a man to his fellows.

"Notable among his engineering achievements are the successful introduction into other countries of improved American mining methods. His scholarly accomplishments are also worthy of mention, especially his translation into readable English from difficult mediaeval Latin of Agricola's famous book 'De Re Metallica.' Mrs. Hoover was associated with him in this enterprise, which occupied 'leisure' hours at one period some years ago."

The citation accompanying the award reads: "To Herbert Hoover, engineer, scholar, organizer of relief to war stricken peoples, public servant."

Plans Study of Wire Rope

A research into the causes of breakdown in wire rope is being organized by a committee of American Society of Mechanical Engineers, jointly with Engineering Foundation. It is planned to construct a testing machine which can reproduce all the varied service conditions to which such rope is subjected. The society would be glad to hear from technical men particularly interested in any phase of the manufacture or use of wire rope.

Fluorspar Duty Increased 50 Per Cent

President's Proclamation Follows Investigation by Tariff Commission, Raising Import to \$8.40 Per Gross Ton

WASHINGTON, Oct. 23.—Increased by 50 per cent, from \$5.60 to \$8.40 per gross ton, by a Presidential proclamation of Oct. 17, the new duty on metallurgical fluorspar becomes effective Nov. 16. It affects only spar containing not more than 93 per cent of calcium fluoride, embracing grades used by the steel and foundry industries, but does not affect the acid and ceramic grades whose costs of production could not be adequately obtained by the Tariff Commission. The commission conducted the inquiry upon application of domestic producers of spar for a 50 per cent increase in the duty through the flexible provision of section 315 of the tariff act. The increased duty, as proclaimed by President Coolidge, is stated in terms of the gross ton because it is the accepted legal unit. Stated in net tons, the increase is from \$5 to \$7.50. The cost report was based on conditions in 1925.

The commission said that the rate of duty shown by the difference in costs of production of spar of the metallurgical grades, containing not more than 93 per cent calcium fluoride, in the United States and the principal competing country (England) necessary to equalize the differences within the limit provided in section 315 is the rate of \$8.40 per long ton, equivalent to \$7.50 per net ton. The report found that the total cost of production in 1925, including transportation to Philadelphia, was \$28.14 for domestic metallurgical spar and \$12.10 for English spar, a difference of \$16.04, while the total cost with transportation to Pittsburgh was found to be \$25.89 for domestic spar and \$15.76 for English spar, a difference of \$10.13. The Pittsburgh district consumes roughly 50 per cent of the fluorspar used in this country, while the Philadelphia district consumes approximately 10 per cent. About 10 per cent of the Pittsburgh consumption is foreign material and the remainder is domestic. Virtually all of the spar used in the Philadelphia district is imported. The latter district is the principal port of entry and the principal market in the United States for imported spar.

The commission said that the present duty of \$5.60 per gross ton does not equalize the difference in costs of production of fluorspar in the United States and England. The difference in costs of production of spar of the metallurgical grades in the United States and in England, it was stated, are greater than the amount of the present duty increased by the total maximum increase authorized under section 315, irrespective of whether the cost comparison is limited to factory costs of production or includes transportation costs to Philadelphia and Pittsburgh.

Costs of production were not ob-

tained by the commission from foreign producers because access to cost records was denied. The report said it was assumed that, in the absence of evidence to the contrary, the cost of production of imported spar is not more than the wholesale foreign price or value as shown by invoices. Invoices of imports in 1925, 1926 and the first half of 1927 were analyzed to ascertain the price of imported spar at foreign plants, the cost of shipment to ports in the United States and the grade of fluorspar shipped. While England was found to be the chief competing country in 1925, Germany was the principal source of spar imports in 1927, supplying 31,829 tons, or 45 per cent of the total, against 18,449 tons, or 26 per cent, from the United Kingdom.

In appearing at the hearing in July of last year on the fluorspar inquiry, Vice-President C. A. Buck of the Bethlehem Steel Co., who protested against an increase in the duty, estimated that his company consumes 80 per cent of the fluorspar imported. It does not use domestic spar because the foreign material can be obtained more cheaply. Mr. Buck attacked the cost figures of the commission in its preliminary report and said that, in considering the costs of producing in England, there was no account of the cost of depreciation, capital investment of plants and related items. He also contended that English spar was largely a reclaimed product from lead mines, but that these stocks are becoming exhausted, after which the English operators will have to resort to deep mining of fluorspar as is done in the United States.

Bethlehem Asked for Lower Duty

Mr. Buck further contended that an increase in duty would be a source of discrimination against the steel industry in the East because the industry in the West consumes domestic spar and would not be adversely affected by a higher duty. It was stated by Mr. Buck that the Bethlehem Steel Co. consumed 33,000 tons of fluorspar in 1926 and that if, as suggested by domestic producers, an increase of 50 per cent in the duty would mean only 20c. a ton additional in the cost of producing steel, the increase to the Bethlehem company alone would be \$82,500 a year. Mr. Buck also contended that it is not the intention of the tariff act that the costs of high-cost domestic producers shall be equalized with foreign production costs by levying heavy import duties or even that an average domestic cost "which has been unduly inflated because of the high costs of a few small producers should be used for the purpose of comparison." Mr. Buck said that even if the duty were increased it would make no difference in the source of Bethlehem's supply

because the imported material would still have to be relied on rather than domestic material, which, it was argued, could not reach the Eastern markets on account of the freight differentials. Mr. Buck had asked that the duty be reduced by at least \$1.71 per ton, which was declared to be the difference in the cost of the domestic product and the English product laid down at Pittsburgh in favor of the American spar.

Domestic Fluorspar Mines Aided by Tariff Increase

One result of the recent action by President Coolidge in approving an increase of 50 per cent in the import duty on foreign fluorspar is that the Hillside Fluorspar Mines will immediately begin the construction of a loading dock on the Mississippi River at Rosiclare, Ill. The company for some time has had plans and specifications ready for this dock, but has delayed starting the work pending the decision just made by the President under the authority granted him by the present tariff law. With the completion of the new dock, the company will be able to serve by river shipments its customers who are able to take shipments that way and that means all of the large steel companies in the Wheeling and Pittsburgh districts, all of which are located on the Ohio, Monongahela and Allegheny Rivers.

Another large fluorspar company for some time has been using the rivers in supplying its Pittsburgh district customers, and the saving in the delivered price to consumers has been about \$2 a ton when the barges of commercial towing companies have been used, and even more when the steel companies have allowed the use of their own barges, returning without cargo.

Between the added impost on foreign fluorspar and the lower delivered charges made possible by river deliveries, the domestic producers should now be able to operate their mines at a profit, a condition that was not possible when the imported product had a substantial delivered price advantage over domestic fluorspar at consuming points as far west as Pittsburgh and Wheeling. Figuring domestic gravel fluorspar at \$17 per net ton at mines, and a river barge rate of \$3 from southern Illinois to Pittsburgh, and handling charges of 50c. per ton, the delivered cost would be \$20.50. Assuming the addition of the full increase of \$2.50 a net ton in the import duty to the present price of foreign gravel fluorspar of \$16, the price would be \$18.50, Atlantic seaboard, to which would have to be added \$3.13 to \$3, the rail freight to the Pittsburgh district, a total of \$21.65 to \$22.07 per net ton. This advantage for American producers exists, however, if delivery is made by water, as the all-rail rate from domestic mines to the Pittsburgh district is \$5.25 per net ton, producing a delivered price based on \$17 at mines of \$22.25.

This Issue in Brief

Don't limit your interests to shop matters, Department of Commerce representative tells industrial engineers. Savings made by production economies may be wiped away by changes forced on business by new conditions. Engineers should study the broad trends of business.—Page 1028.

* * *

Are we wasting money on super-accuracy? As much waste results from needless super-accuracy as from undue inaccuracy, says speaker at industrial engineers' meeting. Warns manufacturers against paying for greater accuracy than the work warrants.—Page 1031.

* * *

Purchasing agents have greater influence upon national prosperity than any other group of operators, says Truscon official. Buyers are not to blame for attempting to eliminate "prosperity margin" on purchases. Sales managers should refuse to furnish goods at less than true value.—Page 1023.

* * *

Finds it does not pay to make all kinds of bolts and nuts on automatic machinery. "Slow sellers" are not made in sufficient quantities to justify the expense of designing and installing special machinery. In these cases semi-automatic or even hand-operated machines are the most economical.—Page 1016.

* * *

Surest way to invite price competition is to refuse to consider a competitor. Competitors should confer and discuss openly their opinions, handicaps and progress, says building equipment manufacturer. Contact and understanding between competitors is essential in properly sizing up the buyer's arguments.—Page 1023.

Age-hardening after cold-drawing is due to carbon. Carbon-free iron is not subject to aging. Phenomenon of age-hardening may be due to the reduced solubility of carbon and iron oxide in ferrite, caused by distorted crystals.—Page 1014.

* * *

Prevent segregation of blast furnace charge by depositing material on the stock line rapidly and lessening the drop. Increasing the bell drop and the angle of the bell will help accomplish this.—Page 1014.

* * *

"Dangerous shortage report" warns material supervisor that stock of a certain part is running low. One person in each department of automotive plant is designated to watch the stock.—Page 1013.

* * *

Good welders produce uniformly good welds, tests reveal. Steel fabricator finds that work of good welders does not vary 10 per cent. The same applies to the poor welders, but there is a considerable difference between the best work of the good man and the worst work of the poor workman.—Page 1026.

* * *

Welding of steel structures will not result in worth-while economies if buildings are designed for riveting and then welding substituted, says welding machine builder. Shop and erection costs would then be of the same order.—Page 1027.

* * *

Automobile output for fourth quarter expected to break all records. No major recession is in sight. Detroit employment barometer has again turned upward and is 50 per cent higher than it was a year ago.—Page 1062.

We could well afford to forget production costs and focus all our energies on distribution problem, says Department of Commerce executive. Savings made in distribution add just as much to annual profits as do production economies, and ought to be easier to make.—Page 1029.

* * *

Great upturn in scrap exports arouses attention of consumers. Exports for first eight months of 1928 were 2½ times those of same period of last year. August, 1928, established a record, at 70,538 tons.—Page 1032.

* * *

"Buying a market" is oftentimes an expensive procedure. Some manufacturers fail to recognize that the fact that a certain product is successfully marketed by one company does not mean that any group can derive profits from the same field.—Page 1023.

* * *

Bases purchase orders on sales forecasts. Purchasing department of automobile plant solicits bids and places contracts for estimated requirements for 12 months. Shipping orders are then placed at intervals during the year.—Page 1010.

* * *

Using salesmen for mass selling is wasteful. Advertising can do this more economically, says building equipment manufacturer, for it conserves the salesmen's time by serving as an introduction.—Page 1022.

* * *

Sales expansion gained through price-cutting is deceptive. No matter what the gain, it would be better if the same brain power were placed back of constructive distribution, says manufacturer.—Page 1023.

ESTABLISHED 1855

The Cost of Noise

AMERICAN workmen seem to be deaf to industrial noises; it might almost be said that Americans are deafened by industrial noises. The roar of rapid and powerful machinery, the clanking of hammers and presses, the grinding of gears (still with us), the puffing of engines and the whistling of exhausts, the ringing of bells and shrieking of sirens—all rise into a crescendo so characteristic of industrialism that the modernist composes "music" to its rhythm. We tolerate this bedlam despite the fact that we all avoid mechanical noises in the home, and pay premiums for silent vacuum sweepers, refrigerators, and household appliances, and judge a motor car by its quiet passing. Even though we search for economies in manufacture, we endure violent noises, every one of which represents waste. Would not an efficiency engineer be lost in a factory, which though busy was quiet?

Perhaps the construction operations in our big cities are no guiltier than other branches of industry elsewhere, but they do seem to proceed with utmost disregard for ear-drums—and some of it seems avoidable. Popular opinion and local ordinances have long since demanded mufflers on gas engines, yet an excavator thinks nothing of parking an air compressor alongside the curb, cranking it up, and when it is not blowing off into the throbbing atmosphere, it is pumping air into pneumatic concrete breakers peppering away like so many machine guns.

Such unnecessary noise is doubtless costly. Street railroads, which have been constant offenders, are beginning to realize this. For instance, car noises in San Francisco are being reduced by more precisely cut gear teeth, and the amplification of such clatter as yet remains is prevented by lead rings inside the gears, sound-absorbing fabric in the car floors, and rubber pads between trucks, bolsters and bodies. Crossings are made of one-piece steel castings, and the wheels ride over on their flanges. This prevents battering at the slots cut in the rail heads; noise is further reduced by imbedding the entire track layout in solid asphalt. The public service company reports that this type of crossing not only prevents resonance from the pavement, and avoids shocks passing through to adjacent buildings, but also is much more economical to maintain and presents a smoother roadway for other vehicles. It is also to be expected that less noisy vibration in the rolling stock will result in lower repair bills.

The cost of construction rackets in big cities is less easy to estimate. But if anyone thinks it is of no importance, let him ask a hotel proprietor alongside an extensive building operation! At the American Welding Society meeting recently it was stated that at least 50 rooms in a Philadelphia hotel had been practically

uninhabitable for nearly a year on account of the noises from adjacent subway and building construction. This represents a loss of approximately \$100,000 income to this one proprietor!

Silent construction is emphasized for welded structural steel erection. For example, as described on another page of this issue, a 12-story hotel at Hot Springs, Ark., was built between two similar structures without the resounding clatter of rivetting guns, and the extra cost of \$8 per ton was undoubtedly justified. The erector said the only improvements he could now suggest would be quiet gears on the hoists and lead faces on the erectors' mauls!

Whether welded erection is inherently more costly than rivetted joints may be questioned. Again, it may be true that the compressed air industry may be able to develop a silent squeezer, portable enough for erection purposes. At any rate, it should be a matter of congratulation that so young a process can compete at no greater a handicap with one which is entrenched behind years of engineering practice and trade union domination. When steel designers work out connection details which can be bolted up adequately and easily, yet provide for the necessary welding in the "down" position; when a sufficient number of trained welders is available; when inspectors and building codes understand and provide for the new method, it may be expected that the overall cost of silent erection will decrease.

Our philosophy is that the best is always cheapest. If welded erection is really a better method from an engineering and constructor's viewpoint, it will before long be demonstrated to cost less than the noise we have accepted for so long as a necessary evil. In such an event, the structural trades will adopt welding as a matter of course. But even if welding should always cost more, there will be many places where the silent method will be demanded by a harassed community, despite the extra. It would not be the first time that the value of public convenience and well being has overshadowed minor financial considerations, and hastened the adoption of some revolutionary proposal.

Straining for Super-Precision

INSTRUMENTS for measuring with utmost precision both linear and angular dimensions have come on in bewildering array in the past two decades. Some of these permit measurements which can be regarded as accurate to the millionth part of an inch. They depend in the most refined types upon the optical splitting up of the length of a light wave. Such devices reflect the highest credit upon those who have developed them.

With such ardor has this work been prosecuted,

however, that it has quite outrun practical needs of plant operation. In cases brought out at a recent meeting in the Engineering Societies Building, New York, purchasers had specified equipment with a required precision far beyond what was reasonable. In each case the manufacturer had quoted upon the devices, but without exception a conference had resulted in deliveries representing much lower precision than was at first demanded, and at a fraction of the initial cost. How often the matter has gone ahead on the original lines was not brought out and we have no means of knowing. However, it was said at the meeting that in many plants 20 per cent of the entire shop cost of producing materials is unproductively expended on attaining undue precision.

If this estimate be correct, it would seem in order for buyers and sellers of high-precision equipment to get together to determine what tolerances are necessary, and then to have the equipment made on that basis rather than on the buyer's knowledge that instruments of *n*th degree precision can be had.

Cartels and Competition

IN Europe the cartel idea has been widely adopted as a means of stabilizing prices and paving the way for industrial profits. Because of the agitation here and there for amendment of our anti-trust laws to permit price regulation such as is practiced by the Continental syndicates, our market news from Europe this week is pertinent.

The high domestic prices maintained by the European tube cartel have caused consumers to place orders with mills in non-member countries. Signs of disaffection are appearing in the heavy rail syndicate, the most inclusive of international steel cartels. One member country insists on taking business in excess of its quota, and a number of mills in other member countries are cutting the cartel price. By curious coincidence the Welsh-American tin plate understanding is also under indirect attack. British exporters, restricted in the amount of the Welsh product that they can handle, are buying German tin plate for resale on the world market.

These reports from abroad, although not yet conclusive in their significance, are nevertheless testimony to the difficulties that beset organized efforts to fix prices and parcel out markets. They remind us that our own price pools of a generation ago usually were broken through violations by members. Artificial restraints on business often invite their own destruction, particularly if they fail to take into account the interests of consumers and possible changes in production methods and costs.

There is reason to pause and consider whether the solution of destructive price competition lies in so obvious a remedy as concerted action among competitors to fix prices and divide markets. It is possible that more indirect methods, such as are being employed in this country, may prove more effective in the long run. Industrial consolidations, in many instances, have benefited both producer and consumer, insuring profits for the former and cheaper goods for the latter. Trade associations, although not attempting to regulate prices, have been increasingly influential in the interests of better cost accounting and fair play in competition. It

is to be hoped that this kind of organized activity can further extend its usefulness in curtailing business practices that are unethical and demoralizing, at the same time preserving competition in its soundest form.

Copper and Gasoline

THE consumption of copper, both at home and abroad, has been very large this year, which is mainly for the reason that this is an electrical age. The demand has been so great that it has been steadily reducing the stock of refined shapes, and at the first of this month the total in the hands of refiners in North and South America was only about 50,000 tons. An irreducible minimum would probably be about 40,000 tons, for the refiners must keep about that quantity on hand to be able to meet promptly the specifications of their customers, as a refiner can no more deplete his stock entirely than a hardware merchant can sell his shelves bare unless retirement from business is contemplated.

In speaking of the position of copper in North and South America, we are expressing the world's position nearly enough; for the refiners of those Continents, whose whole product is sold via New York, account for about 85 per cent of the world's refining. The statistics that are now possessed are moreover pretty thoroughly revealing; for their prompt and accurate disclosure of the position, in all respects, from mines to refineries, has made it safe for manufacturers to order closely, as never before, in conformity with their requirements.

In other words, manufacturers have not felt constrained, in recent years, to carry such reserves in their yards as formerly when they were more in the economic dark; and consequently more of the industrial stock has been visible and less of it invisible than used to be. It may reasonably be conjectured, however, that manufacturers observing the steady contraction in stocks this year have been recently stocking up to some extent, as prudence would inspire; and it may also be conjectured that producers, examining the same statistics, are taking steps to increase their output, for which they have available capacity.

In the meanwhile the price for copper has been quite stable, with a slowly rising tendency. At the beginning of 1928 it was 14½c. delivered in Connecticut and now it is 15½c., domestic deliveries in other territories and foreign deliveries being quoted correspondingly. The intensity of the demand has been an adequate explanation of this trend. Any other explaining would be in respect to the very moderation in the market, which has evinced no runaway signs, although they might have been expected.

When the market neared 15c., there were some inquiries from labor as to what would be coming to it, there having been an old understanding that a crossing of that mark meant an advance in wages. The American producers responded with a general advance of 10 per cent as to wages, probably considering it wiser to do that gracefully than under duress. This increased their cost of production about 0.5c. per lb., for it may be roughly generalized that the direct cost (exclusive of capital charges, etc.) is in the neighborhood of 10c. and that the payroll comes to about half of that. Following this the price was raised to 15¼c., which buyers were quite willing to pay.

One of our daily contemporaries published an edi-

torial criticizing this advance and it has been reported that the Federal Trade Commission will investigate it. For some mysterious reason the copper producers seem to be always under governmental suspicion. In this instance the advance is alleged to have been made uniformly, whence it is inferred that it may have been collusory. This does not accredit the copper producers with either any sense or any respect for the law.

When in a strong sellers' market one merchant advances his price, and ascertains that he can get it, his competitors are quick to do likewise. Similarly and oppositely in a buyers' market, when one producer starts cutting prices. This is the same whether it be copper or gasoline.

The situation in these two commodities—copper and gasoline—during 1928 has been indeed very similar. In both of them there is an excess of producing capacity but it does not follow therefrom that there should be a complete use of capacity with the consequences of slaughtering prices and extinguishment of profit on the entire capital investment.

The production of gasoline has been well maintained, but, without there having been any such great curtailment of the stock as has occurred in copper, the price for gasoline in Mid-Continent territory has risen from about 5.5c. per gallon in the early part of this year to a midsummer price of 9.5c., which still prevails, largely owing to the mild autumn. As the weather becomes inclement and automobiling contracts, there will probably be some softening of the price for gasoline. In this as in other commodities demand is the more potent influence in making the price. Producers always want to sell as much of their commodities as profitably they can, but buyers generally do not have to pay any more than they are willing to give.

Conquest of the Air

ADDRESSING the steel treaters at Philadelphia on Oct. 11, E. P. Warner, Assistant Secretary of the Navy for aviation, reminded his hearers that 436 years ago Columbus approached these shores by a primitive method of transportation and that four years ago at about the same time a rigid airship, which is now the Los Angeles, flew from Germany to the United States. Again at almost the same period this year, another dirigible was about to cross the Atlantic. And a few days after the Philadelphia meeting the arrival of the Graf Zeppelin at Lakehurst marked another epochal event in commercial aviation.

In the historic crossing of 1492 the dependence of the navigators was almost entirely upon wood; metals played a very small role. In the years following, iron, and then steel, became essential, and today, in most forms of transportation on land and sea, steel and its alloys are mainly responsible for the high degree of speed and safety attained.

It is through research in another field, however, that the flights of the Los Angeles and the Graf Zeppelin became possible. To the discovery of the light aluminum and related alloys, properly heat-treated, must be credited the success of these giants of the air, whose framework is made of the light alloys. In this achievement, as in recent improvements in construction which have made the airplane so efficient and de-

pendable, the cooperation of the steel treater and the metallurgist has been an indispensable factor.

Freight Car Requirements

IN view of recent suggestions that the railroads are likely to be heavier buyers of freight cars in the next few months than they have been for two years or more, statistics showing the recent trend or pace should be of interest.

Class I railroads, representing about 90 per cent of the railroad mileage and 96 per cent of the total revenues, installed and retired freight train cars, including cabooses, as follows in calendar years:

	Installed	Retired
1917	117,210	62,253
1918	65,249	56,024
1919	76,019	43,274
1920	36,044	75,197
1921	63,406	69,245
1922	105,394	126,471
1923	232,060	213,789
1924	156,572	118,590
1925	139,083	128,573
1926	93,369	103,152
1927	72,410	95,753

Monthly reports for seven months of this year show, for freight cars only, 33,748 cars installed and 48,554 cars retired, while August 1 there were 13,531 cars on order.

Thus for two and a half years the trend has been to install fewer cars than are retired, and the retirements themselves have been trending downward. At the end of last year the freight carrying cars in service were as follows, for Class I roads:

All steel	799,820
Steel underframe	1,086,982
Wooden	437,299
Total	2,324,101

Some confusion of thought resulted recently from publication of a report submitted by the arbitration committee of the mechanical division of the American Railway Association, it being assumed in some quarters that wooden cars were to be legislated out of service and that heavy buying of cars would thereby be forced. It has since been explained that it is the regular policy not to legislate equipment out, but to give it a chance to wear out. The recommendation was that no wooden cars under a certain definition be accepted from owners after January 1, 1931, and no wooden cars of another description be accepted for interchange after January 1, 1934.

In view of the policy it may properly be taken that wooden cars are to be retired in future as in the recent past, according to their wearing out. No large increase in the rate of retirement is to be expected, but on the other hand an increase in installations, relative to retirements, may be expected if traffic warrants.

In this connection there are significant data. Car surpluses have been progressively decreasing. Earlier this year car loadings were running below both 1927 and 1926, but in the past few weeks they have been running ahead of those years week by week. A large surplus of cars is naturally undesirable, but it certainly would seem well for the railroads to aim at having some surplus all the time. The cost of carrying the surplus would be much less than the cost, in derangements, of even temporary shortages.

CORRESPONDENCE

Against Legislation to Legalize Resale Price Fixing

To the Editor: I note in *THE IRON AGE* of Oct. 18 a discussion by your Washington correspondent of the provisions of the Kelly-Capper bill which is to come before the next Congress. The article says that the proponents of the bill expect that the Federal Trade Commission, which is now investigating the question, will be favorable to legislation permitting manufacturers of certain trademarked or branded articles that are distributed through jobbers and retailers to fix and maintain the resale price. It looks to me as if there were some special axes to be ground in this movement.

If the producer deems it desirable to prescribe the maintenance of a resale price, let him do so if he can. He becomes then, in effect, the retailer of his own goods, the final merchandiser acting as his agent. The producer has frequently incurred the expense of national advertising for the purpose of promoting sales at his price. If the manufacturer sees fit to limit the handling of his goods to those who will obey him, that is his right. A shopkeeper who is unwilling so to agree, who is unwilling to act in the quasi-capacity of agent, has no good ground for complaint if the manufacturer refuses to let him have the proprietary goods.

If on the other hand a shopkeeper sees fit to sacrifice a portion of his margin, he has a perfect right to do so, providing he has not entered into an agreement with the producer to the contrary. There are instances of the shopkeepers of a city entering into an agreement among themselves that they will not cut prices—as to which the supplier of the goods is indifferent. But let us not have any legislation on this subject.

A trademark is essentially an identification and confers no economic privileges unless it be monopolistic. The Eastman Kodak Co. may be able to maintain a uniform price for kodak films, but the manufacturer of Camel cigarettes would commit suicide if he attempted to do so.

So far as the writer can see there is no fault in our present system of merchandising and pricing. Consumers generally welcome the opportunity to buy cigarettes, razor blades and many other things at cut prices, and bless the mail order houses, chain stores and department stores that help them to do so. This is promotive of sales, wherefore there is no reasonable ground for complaint from the manufacturers.

Without any doubt our mail order houses, chain stores and department stores are economic benefits of the first order. Likewise there is no doubt that our older system of retail merchandising is overequipped and overmanned; that is, there are too many shops and too many persons attending them. The relatively high prices that are asked in them do not inure to the profit of the shopkeepers, comparatively few of whom become well to do, but they go to pay the wages of inefficiency, including unnecessary personnel. The chain stores are now estimated to be doing about 16 per cent of the retail business of this country. That percentage is swelled by what the department stores and mail order houses perform. There is thus proceeding naturally a correction of one of our greatest economic wastes.

There are consumers who are too lazy or too incompetent to take advantage of opportunities for advantageous buying, which might put them to more trouble. Such consumers simply pay the price for certain service, which is optional with them, wherefore they deserve no special consideration. We may feel sorry for the small shopkeepers and their clerks who are being thrust out of occupation; but similarly do we feel sorry for the surplus coal miners, for the surplus weavers and spinners, and others who are being forced into new and strange employments. The economic pressure is precisely analogous. Although we have sympathy for such persons in what is always a painful readjustment, that does not mean that either they or anyone else have claims for support by the body public.

The subject of resale prices is distinctly one to be let alone to go its own way. Anything of the nature of legislative price-fixing is abhorrent. Anything that the Federal Trade Commission or Congress might do would be meddling and pretty sure to be mischievous.

Laissez Faire.

Increase in Fluorspar Duty Has Saved the Domestic Situation

To the Editor: The action of President Coolidge in raising the duty on fluorspar meets with the approval of all the producers of that mineral in the United States. As a matter of fact the imports of fluorspar have been, so far as the miners are concerned, a scandal. The foreigners in sending spar to this country, in my opinion, abused their privilege. They made the deliberate attempt to destroy the American industry and they came perilously near succeeding. What with cheap labor abroad and ballast rates across the ocean for freights the American spar miners have had no show whatever. The whole market was controlled and in the power of the foreigners.

In producing spar we pay the American rates of wages, we pay high prices for all our mining supplies and explosives, and to reach our markets we are paying the highest rates of freight that have ever been known—in many cases more than twice as much as we paid 15 years ago. We are not complaining of these things; they are part and parcel of our American industrial system; they belong to the large American plan of general prosperity. But because of our low duty the foreigners flooded the country with spar and the American miners have been denied their share of business, let alone their share of profits. We have been faced with an unfair and unjust competition and conditions can only be remedied by an adequate tariff. This increase that the President has just declared will tend to give us a share of the American market and it is highly probable that the spar mines that have been shut down so long, with all their investments idle, will be able to resume operations.

Furthermore, it is my belief that our American spar is of a substantially better quality than foreign spar. Practically all the spar produced in America comes from southern Illinois and western Kentucky. It is nearly all one region, cut across, however, and divided by the Ohio River. Gloom and despondency has been the chief factor in that region for the past five years. Idle mines, idle miners, have been the rule. Those interested in the spar industry are hoping to speedily see a change in the situation.

JAMES A. GREEN.

Cincinnati, Oct. 19.

Schedule of the next instalments of the Business Analysis and Forecast, by Dr. Lewis H. Haney, Director New York University Bureau of Business Research, follows: Nov. 1—Activity in Steel Consuming Industries; Nov. 15—Position of Iron and Steel Producers.

Iron and Steel Markets

Primary Materials Still Advancing

Prices of Scrap, Pig Iron and Coke Make Further Gains—
Pipe Line Order Calls for 45,000
Tons of Steel

THE fundamental strength of the iron and steel market is emphasized by continued advances in primary materials. Prices of pig iron, scrap and coke have made fresh gains, giving added support to an already strong situation in finished steel.

The pressure of steel producers to increase output has magnified the scarcity of scrap, and a consequent driving of blast furnaces to obtain a compensating increase in pig iron tonnage has created extra demands for furnace coke. Heavy melting scrap at Pittsburgh has advanced another 25c. to \$18 a ton, an increase of \$4 a ton since the third week in July and the highest price since September, 1926. Furnace coke at Connellsville, after rising 10c. a ton last week, has gone up another 15c. to \$2.90.

The pig iron market is also feeling the effects of the enlarged needs of steel companies. Their refusal to sell their surplus supplies has created a shortage of basic iron in the Valleys in the face of several sizable inquiries. This factor for price strength in what is primarily a steel producing district is matched by expanding demands for foundry grades in other territories.

At Chicago, Cleveland, Detroit and Ironton, foundry iron has advanced 50c. a ton. Sales of 38,000 tons at Cleveland were made up in large part of supplementary purchases for the current quarter. Reports from other centers also indicate that buyers had underestimated their requirements. Contracting for the first quarter has not yet assumed large proportions except in the Chicago district, where orders have been placed for fully 40 per cent of melters' requirements for that period.

In finished steel there are evidences, although not yet conclusive, that the peak of activity has been passed. At Pittsburgh shipments exceed incoming business in most products, notably bars, plates and shapes. At Cleveland a decline in bookings is also reported, but in the East the tonnage taken so far this month in the heavier rolled products has kept pace with that entered in the corresponding weeks in September.

Bar prices are especially strong in Eastern markets, where many buyers face the necessity of paying 2c., Pittsburgh, contrasted with 1.90c. to 1.95c., paid by contract customers for the quarter. At Chicago, specifications again exceed shipments, after a noticeable drop a week ago, and new business is slightly above the average of the past 12 weeks. Chicago prices for plates, shapes and bars are stronger, with 2c. rapidly giving way to 2.10c., an advance of \$2 a ton.

Steel production still holds at close to 90 per cent of capacity. Slightly reduced output is reported by Valley mills.

Current recession in the demand from the automotive industry is regarded as temporary, pending the starting of production on new models about the middle of next month. The Chevrolet company, the largest manufacturer bringing out a new car, has released its first orders for body steel and will shortly buy fender stock. Makers of automobile frames will resume operations at close to capacity in the third week of November.

The September report of independent makers of sheets and strips sustains the view that buyers ordered and specified freely to escape the reduction in cash discount effective Oct. 1. Sales were equivalent to 117.5 per cent of capacity and shipments 102.3 per cent.

Railroad equipment inquiries are increasing when car scarcity is being reported for the first time in several years. Whether this coincidence is significant or not, in view of the fact that instances of car stringency are isolated and by no means alarming, the week brought the Rock Island into the market for 2750 cars and the Canadian National for an additional 1500. Early inquiries are expected from the Missouri Pacific for 3000 cars and from the Buffalo, Rochester & Pittsburgh for 1000. The Pennsylvania has placed an order for 1000 box cars with its own shops.

The Roxana Petroleum Co. has divided 45,000 tons of 10-in. pipe for an oil line from McCamey to Houston, Tex., between a Youngstown and a Pittsburgh mill. The Southern Natural Gas Co. is inquiring for 25,000 tons of 4 to 24-in. pipe.

Two base prices on hot-rolled strip, rather than a single base, are being rather generally adopted, following issuance by the Sharon Steel Hoop Co. of a card of extras embracing all widths from $\frac{3}{8}$ in. to 24 in.

Leading producers of ferromanganese have opened their books for all of next year at \$105, seaboard, the price now ruling. Heretofore contracts have been on a six months' basis.

A 50 per cent increase in the duty on gravel fluor-spar (from \$5 to \$7.50 per net ton) will go into effect Nov. 19. An advance of \$1 a ton to \$18, mines, on domestic fluorspar for first quarter delivery is reported as a possibility.

Copper has again advanced $\frac{1}{4}$ c. a lb. to 15 $\frac{1}{2}$ c., delivered in the Connecticut Valley. This is the highest price since May 16, 1923.

For the first time in many months THE IRON AGE pig iron composite price is higher than it was a year earlier. It is now \$17.92 a ton, compared with \$17.84 last week and a year ago. The finished steel composite remains at 2.362c. a lb.

A Comparison of Prices

Advances Over the Previous Week in Heavy Type, Declines in Italics
At Date, One Week, One Month, and One Year Previous

Primary Materials Strengthen as Heavy Steel Operations Draw on Scanty Supplies

PITTSBURGH, Oct. 23.—The primary materials rather than steel have held the center of the stage in the past week. With a further advance of 25c. a ton on heavy melting steel scrap in this market, the scramble of dealers to obtain material for delivery on old orders has not subsided, and to make the situation even stronger there have been some rather large purchases in the Youngstown district at \$18 to \$18.50, which effectually shut off the possibility of local dealers getting material in the West. Advances of 50c. to \$1 a ton are being sought on pig iron, especially on the basic grade, which seems to be badly wanted for prompt shipment by at least four melters. Coke is keeping up with the procession. No spot furnace fuel for prompt delivery is available under \$2.90 per net ton at Connellsville ovens and sales of small lots at as high as \$3.

The movement in these materials is a direct reflection of the exceptional activity in the steel market over the past 45 days. The steel companies have been persistent in demanding delivery of scrap on their orders, and, in the absence of large supplies, prices have soared steadily. Pig iron has gained in value with the rise in scrap and coke has stiffened because of the demands occasioned by the necessity of driving blast furnaces to the limit to get all the pig

iron that is needed with scrap scarce and finished steel orders large.

The steel market, however, lately has given signs that the peak of the activity was being passed. Again in the past week shipments have outrun incoming business in most products, notably in bars, plates and shapes. Some of the sheet makers report having added slightly to backlogs in the past week and some of the producers of strips have a similar report. If an order for 40,000 tons of pipe for

a Texas oil line has not already been placed, it is likely to be in the next few days. Generally, however, order books are beginning to grow smaller, and a fresh wave of buying will be necessary to sustain plant operations at the present rate. In the Youngstown district, a slight recession has taken place, despite the fact that sheets appear to be the most active of all steel products and Youngstown is the center of production. Ingot production for the Pittsburgh-Wheeling-Youngstown-Johnstown district, however, remains at about 90 per cent of capacity.

The matter of the new base prices and the card of extras for hot-rolled strips has been clarified by the appearance of a card embracing all widths from ⅜ in. to 24 in., with a base price of 1.90c. for material 6 in. and wider and of 2c., base, for stock under 6 in. Several manufacturers have announced adoption of this card, which will probably now find general use.

Steel prices generally are firm, a condition usual to periods like the present, with producers well supplied with orders and buyers covered against their immediate needs.

Pig Iron.—Generally higher prices are being sought for pig iron, but as yet have been unrealized, as the price ideas of buyers are not moving upward as rapidly as those of producers. Most producers now are quoting basic iron at \$18 and are holding malleable and Bessemer at the same price, while the common asking price on foundry iron is \$17.50 for No. 2, all prices being f.o.b. Valley furnace. At least four melters of basic iron are reported as interested in supplies, and, as the steel companies still are refusing to sell any of their surplus, merchant furnaces are seizing the opportunity to put the market back on a profitable basis. One sale of slightly less than 2000 tons of basic iron, somewhat off in analysis, is reported at a price that figures out to \$17.50, Valley furnace, for strictly standard analysis iron, but aside from this sale there has been no business to justify a higher price than \$17. A fair appraisal of the market on this grade is \$17 to \$18, the lower price representing the last sale of importance of standard iron and the higher figure being what now is wanted by producers. Small sales of both Bessemer and malleable iron are reported at \$18, Valley furnace, but in the past week quite as much tonnage has been sold at \$17.50. There also have been sales at \$17. Aside from basic iron, there is very little consumer interest and in that grade the call is for iron for prompt delivery, which makes the higher asking prices somewhat of a premium for early shipment. The Carnegie Steel Co. has put on a blast furnace of its Edgar Thomson group. This reflects a big demand for sheet bars and the approach of the rail rolling period. The Bethlehem Steel Co. has taken off a furnace at Johnstown, Pa.

Prices per gross ton, f.o.b. Valley furnace:

Basic	\$17.00 to \$18.00
Bessemer	17.50 to 18.00
Gray forge	16.50 to 17.00
No. 2 foundry	17.00 to 17.50
No. 3 foundry	16.50 to 17.00
Malleable	17.50 to 18.00
Low phos., copper free....	26.50 to 27.00

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Ferroalloys.—Leading producers have announced a price of \$105, Atlantic seaboard, on ferromanganese.

this price to be good for all of next year. Willingness to take business for the entire year represents a departure, as hitherto contracts have been on a six months' basis. The price announcement is much earlier than usual, owing, it is said, to a desire by producers to stop suggestions recently current that an advance was likely.

Hot-Rolled Flats.—The Sharon Steel Hoop Co. has issued a new card of extras covering widths from $\frac{3}{8}$ in. to 24 in. This range of widths takes in the hoop and band sizes and means that these products and strips now are on a common card and a common base, which for widths less than 6 in. is 2c., Pittsburgh, and for 6 in. and wider, 1.90c., Pittsburgh. The Republic Iron & Steel Co. and several other producers have announced adoption of this card and of a double base price, splitting at 6 in. Eventually, a single base for all widths is probable, as in formulating the new card the Sharon Steel Hoop Co. announces that the effort has been to correct inequalities that existed in the old card, and a single base, plus the new extras, corrects those errors. Strip mill capacity in this district still is heavily engaged, with orders and specifications almost equaling shipments. Not much business yet has been done on the new base prices or extras, because so many users are under contract for this quarter on the old base and card.

Cold-Rolled Strips.—Makers are very firm at 2.85c., base Pittsburgh, on new business and some business is being taken on that level, although the bulk of the shipments carry a price \$2 a ton less.

Semi-Finished Steel.—A large movement of billets, slabs and sheet bars on contracts continues. Most non-integrated strip and sheet producers were able to secure this month's requirements on third quarter contracts carrying prices \$1 a ton below fourth quarter prices, but are using up supplies so rapidly that it is doubtful whether they can go far into November without ordering against contracts for this period. Strip and sheet mills have rarely been more

heavily engaged. Wire rods are moving steadily, and the price is well maintained at \$42, base Pittsburgh or Cleveland.

Bars, Plates and Shapes.—Shipments of these products are exceeding incoming business, and, with order books decreasing, delivery promises on new business in bars have shortened slightly. At the beginning of the month many mills were mentioning four weeks as the earliest delivery on popular sizes, but now they can be had in two to three weeks. Delivery promises have not been extended on shapes or plates, and the latter are available for fairly prompt shipment. Prices are very firm at a range of 1.90c. to 2c., base Pittsburgh, with the lower figure available chiefly to important buyers, while the higher figure refers to small and unattractive tonnages and is being paid more frequently for bars than for shapes and plates. Structural shops here uniformly report quiet business in the past week. Much business is in prospect.

Rails and Track Supplies.—The larger roads depending upon Pittsburgh mills for a good part of their rails and track supplies have not yet distributed orders for their 1929 requirements. But the expectation of the early closing of this business creates a better feeling in this division of the market. Light-section rails and small spikes are very slow.

Tubular Goods.—The market is running in its recent grooves, with a good demand for seamless oil country pipe, a steady demand for butt welded pipe for building construction and heating purposes, but only a moderate degree of activity in lap welded pipe aside from that required for pipe lines. Most makers have backlogs in the latter class, and a local and a Youngstown maker will divide an order for 450 miles of 10-in. pipe for an oil line from McCamey to Houston, Tex., while there is an inquiry out for 25,000 tons of 4 to 24-in. pipe from the Southern Natural Gas Co.

Wire Products.—Nails are rather slow with most makers, but wire products business as a whole is making a

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 down to and including 2½ in. squares, the price is \$5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a \$5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

good showing in comparison with the average for this time of the year. Prices are well maintained on all products. Bright nails are being sold in carload lots at \$2.55, base, per keg to jobbers, but evidence is lacking that all makers are insisting upon an advance of 10c. per keg to others who are able to buy in carload lots.

Sheets.—The market still is extremely active, and some makers report that they have added slightly to their backlogs, bookings in the past week having exceeded their shipments. The monthly report of the National Association of Flat Rolled Steel Manufacturers on September sheet business fully sustained the current reports that buyers were ordering and specifying freely to escape the lower cash discount effective Oct. 1, and to avoid higher prices named on the common finishes for this quarter. Sales of the independent companies reporting were 117.5 per cent of capacity and shipments 102.2 per cent of capacity, making the month one of the best since records were made public. Mills are encountering reports of lower prices, but, generally, the quoted prices are ruling. No material letdown in the demand from motor car body builders is reported here, as loss of business incident to the slowing up of some companies is offset by increasing production by others. Mill operations remain at full physical capacity, with some producers running at full theoretical capacity.

Tin Plate.—Business still is rather slow, although some makers in the past week have enjoyed a slight increase in orders. General line tin plate is in good demand, and there is a fairly good export business. Packers' can requirements have been satisfied for this year and not much business for early 1929 needs is expected until prices have been announced.

Warehouse Prices, f.o.b. Pittsburgh

	Base per Lb.
Plates	3.00c.
Structural shapes	3.00c.
Soft steel bars and small shapes	2.90c.
Reinforcing steel bars	2.75c.
Cold-finished and screw stock—	
Rounds and hexagons	3.60c.
Squares and flats	4.10c.
Bands	3.60c.
Hoops	4.00c. to 4.50c.
Black sheets (No. 24), 25 or more bundles	3.70c.
Galv. sheets (No. 24), 25 or more bundles	4.55c.
Blue ann'd sheets (No. 10), 1 to 10 sheets	3.35c.
Galv. corrug. sheets (No. 28), per square	\$4.43
Spikes, large	3.40c.
Small	3.80c. to 5.25c.
Boat	3.80c.
Track bolts, all sizes, per 100 count, 60 per cent off list	
Machine bolts, 100 count, 60 per cent off list	
Carriage bolts, 100 count, 60 per cent off list	
Nuts, all styles, 100 count, 60 per cent off list	
Large rivets, base per 100 lb.	\$3.50
Wire, black soft ann'd, base per 100 lb.	\$3.00 to 3.10
Wire, galv. soft, base per 100 lb.	3.00 to 3.10
Common wire nails, per keg	3.00
Cement coated nails, per keg	3.05

Old Material.—Typical of such market conditions as the present, are reports that this mill or that has bought and paid an even higher price than has recently prevailed for heavy melting steel. Such reports are that the United States Steel Corporation bought a big tonnage, that the Jones & Laughlin Steel Corporation, which has been out of the open market for several years, was a purchaser, and that a large tonnage of heavy melting steel was bought by Youngstown steel companies. There is some acceptance of the report about the Youngstown purchases in the fact that steel works in that district are operating practically full and deliveries on low-priced scrap orders were not sufficient. But fresh buying in this district has been very light on the part of steel producers and the market has been chiefly made by dealer purchases to cover short sales. The market has strengthened, however, and, while no sales of heavy melting steel into consumption are noted at more than \$18, there appears to be none of this grade available at less. Compressed sheets are not available at less than \$17.50 and the market is firmer on heavy breakable cast which has sold at \$14.50. Steel foundry grades also are firmer.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
Heavy melting steel	\$18.00
Scrap rails	17.50
Compressed sheet steel	17.50
Bundled sheets, sides and ends	\$15.50 to 16.00
Cast iron car wheels	15.25 to 15.75
Sheet bar crops, ordinary	18.00
Heavy breakable cast	14.00 to 14.50
No. 2 railroad wrought	18.00
Heavy steel axle turnings	15.00 to 15.50
Machine shop turnings	11.00 to 11.50
Acid Open-Hearth Grades:	
Railr. knuckles and couplers	19.00 to 19.50
Railr. coil and leaf springs	19.00 to 19.50
Rolled steel wheels	19.00 to 19.50
Low phos. billet and bloom ends	20.50 to 21.00
Low phos., mill plates	19.00 to 19.50
Low phos., light grade	18.00 to 18.50
Low phos., sheet bar crops	19.00 to 19.50
Hvy. steel axle turnings	15.00 to 15.50

Electric Furnace Grades:	
Low phos. punchings	18.50 to 19.00
Hvy. steel axle turnings	15.00 to 15.50

Blast Furnace Grades:	
Short shoveling steel turnings	12.50 to 12.75
Short mixed borings and turnings	12.50 to 12.75
Cast iron borings	12.50 to 12.75
No. 2 busheling	11.25 to 11.75

Rolling Mill Grades:	
Steel car axles	19.00 to 20.00
No. 1 railroad wrought	13.50 to 14.00
Sheet bar crops	18.00 to 18.50

Cupola Grades:	
No. 1 cast	15.50 to 16.00
Rails 3 ft. and under	18.00 to 18.50

Cold-Finished Steel Bars and Shafting.—Reports as to business vary somewhat, but such slowing down as there has been in automobile production has not been felt. There is still much insistence on deliveries. Prices are firm at 2.20c., base Pittsburgh or Chicago.

Bolts, Nuts and Rivets.—Business is good enough to sustain an operation of approximately 60 per cent of capacity. Makers consider this a satisfactory operation, since so many

large consumers are making their own supplies. Prices are firm.

Coke and Coal.—Spot furnace coke is scarce this week owing to some extra demands from a Buffalo steel company anxious to increase pig iron production and a local steel company unable, on account of low water, to transport by river as much coke as is needed from its own ovens. Coke for immediate delivery has readily commanded \$2.90 per net ton at ovens and even \$3 has been paid for small lots. More ovens are going in, however, and coke for delivery next week is plentiful. Spot foundry coke is doing well at unchanged prices. The coal market is good only in household sizes, with slack still a drug on the market.

Pig Iron in Detroit at \$19; Scrap Firm

DETROIT, Oct. 23.—Producers of pig iron serving the district are quoting \$19, and the market is very firm on this base. Despite reduction in melt in automotive shops, due to change in models, the stove and furnace manufacturers have increased melt sufficiently to take up the slack, with the result that shipments of pig iron are about the same as in September.

The market on old material in the district is very firm, with flashings registering an advance of 25c. per ton.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	\$13.00 to \$13.50
Borings and short turnings	9.00 to 9.50
Long turnings	8.00 to 8.50
No. 1 machinery cast	14.00 to 15.00
Automobile cast	19.00 to 20.50
Hydraul. comp. sheets	12.25 to 12.75
Stove plate	11.00 to 12.00
No. 1 busheling	10.00 to 10.50
Sheet clippings	8.00 to 8.50
Flashings	10.75 to 11.25

Adopts Simplified Brands for Sheet Steel

The American Sheet & Tin Plate Co., Pittsburgh, has adopted a new single brand for its products. The new brand will be applied in white on black sheets and in black on galvanized sheets. Trade names and grade designations will not be included within the brand hereafter, but will be placed below the brand in plain letters. When Keystone copper steel is used the fact will be indicated by a large Keystone symbol placed back of the branding.

The number of electric hoists ordered in September, according to the records of the Electric Hoist Manufacturers Association, E. Donald Tolles, secretary, 165 Broadway, New York, showed an increase of 11.2 per cent over August. In value orders showed a 26.7 per cent increase. Shipments fell off 10.5 per cent from August. The association will meet Nov. 22 at the Hotel McAlpin, New York.

Chicago

Iron and Steel Markets Take on Renewed Strength—Pig Iron Up 50c.—Car Inquiries Larger

CHICAGO, Oct. 23.—Practically every branch of the Western iron and steel market has taken a stronger position in the past week. Prices for plates, shapes and bars are firm, and the circle of buyers which has been successful in placing orders at 2c. per lb., Chicago, is rapidly narrowing. Pig iron has been advanced 50c. to \$19 a ton., local furnace, and sales for delivery in the first quarter are heavy. Cold-rolled strip has been advanced \$2 a ton, and producers expect to announce in a few days higher quotations on sheets.

Specifications for finished steel, after the drop of a week ago, are again heavier than shipments, and sales are a trifle above the average for the past 12 weeks. An upturn in demand from manufacturers of automobiles is noted, but schedules make it appear that output, though down only a small percentage, will not again reach the proportions of early October until new models are put in production about the middle of November. Frame makers are scheduled to resume at nearly capacity output about the third week of next month.

Structural shops have backlogs fully 20 per cent heavier than a year ago, and the outlook is favorable, since the slackening in building operations appears to affect principally those structures which do not make heavy use of steel.

The Rock Island has added 1000 gondolas and 250 flat cars to its inquiry of several days ago for 1500 box and stock cars.

Pig Iron.—Northern foundry iron has been advanced 50c. a ton to \$19 for the No. 2 grade. Sales for 1929 delivery are large, and the trade estimates that not less than 40 per cent of first quarter requirements have been covered. A melter west of Chicago has ordered 1200 tons for delivery after the turn of the year. A user in Muskegon, Mich., has contracted for five boat-loads to be shipped from Lake Erie ports. The first cargo, 3300 tons of silvery from Buffalo, has been unloaded. A Buffalo seller will ship another cargo of silvery and one of foundry iron and a furnace at Toledo will send two boat-loads of foundry iron. Sales of charcoal iron are unusually active at \$24 a ton, furnace. A shortage exists in several grades. Southern iron prices are strong, and there is talk of an advance to \$17, Birmingham. Although first quarter books in silvery have not been officially opened, it is said that protection at present prices will be extended. Prices are strong, and an advance of \$1 a ton is a possibility. Shipments of Northern iron are heavier than in September, and prompt deliveries are demanded.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil.	1.75 to 2.25..	\$19.00
N'th'n No. 1 fdy., sil.	2.25 to 2.75..	19.50
Malleable, not over 2.25 sil.		19.00
High phosphorus		19.00
Lake Super. charcoal, sil.	1.50....	27.04
So'th'n No. 2 fdy. (all rail)		22.26
Low phos., sil. 1 to 2, copper free		\$29.00 to 29.50
Silvery, sil. 8 per cent.		29.79
Bess. ferrosilicon, 14-15%.		46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—Books have been opened on 50 per cent ferrosilicon for 1929 delivery at \$83.50 a ton, deliv-

ered. Car lot orders are priced at \$88.50. Forward contracting is active, fully six weeks earlier than a year ago. The first half price for ferromanganese is announced at \$105 a ton, seaboard. Buyers are showing some interest in future requirements. Spiegeleisen is steady at \$32 to \$33 a ton, Hazard, Pa., for the 19 to 21 per cent grade. A user in this district has closed for 600 tons for delivery next year.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$87.50; spiegeleisen, 19 to 21 per cent, \$40.76.

Plates.—Railroad car buying prospects are brighter as a result of an inquiry by the Rock Island for 2750 cars. The trade is expecting an inquiry from the Missouri Pacific for 3000 cars. Inquiries now before the trade, plus the 3000 cars which seem reasonably assured, call for not less than 120,000 tons of steel. In addition to this tonnage, steel will be needed by the Chicago, Burlington & Quincy and the Chicago, Indianapolis & Louisville for miscellaneous cars to be built in the shops of these roads. Specifications from car shops are small, covering only miscellaneous needs for small car orders placed in recent months. Need for plates in oil fields on the Pacific Coast and in the Southwest is more urgent. A Chicago mill has taken two orders for more than 5000 tons of oil storage tank plates for delivery in the Southwest. There is still 5000 tons on inquiry in that part of the country, and in addition several oil producing companies in the West will buy an aggregate of 4000 tons. A California oil pipe line will take 50,000 tons. Chicago plate mills are engaged at close to 80 per cent of capacity. Specifications from pipe makers are light; legal matters are being arranged that will release a large tonnage against contracts recently placed. Prices are firm at 2c. to 2.10c., Chicago.

Mill prices on plates, per lb.: 2c. to 2.10c. base Chicago.

Bars.—Specifications for mild steel bars are heavy, and deliveries from several Chicago mills have been set back about one week. Following the drop of a week ago, releases from manufacturers of automobiles are

larger, but they have not regained the ground previously lost. Forgers in the Chicago area are taking steel to meet full capacity operations. Although orders for automobile parts are lighter, there is an increasing demand for forgings from builders of cranes and construction machinery such as will be used in flood control work in the Mississippi River valley. New business in soft steel bars is measurably larger under the influence of several sizable fourth quarter contracts placed by railroads. Prices remain firm at 2c. to 2.10c. per lb., Chicago. With contracting well out of the way, producers are attempting to narrow the circle of buyers who are quoted less than 2.10c. The iron bar market is quiet both in new buying and specifications. Spot purchases of alloy steel bars are in good volume, but backlogs are growing lighter. Specifications from the automobile trade are heavier, but not equal to the rate in the early weeks of October. New orders for rail steel bars are fully equal to shipments, and both local mills continue to operate on a double turn basis. The bed trade, which usually curtails output at this time of the year, is still taking steel in good tonnage. Deliveries of rail steel bars are not better than four weeks on the average, and prices are firm.

Mill prices per lb.: Soft steel bars, 2c. to 2.10c., base, Chicago; common bar iron, 2c. to 2.10c., base, Chicago; rail steel bars, 1.95c., base, Chicago Heights mill.

Warehouse Business.—Shipments have gradually expanded for several weeks and now are measurably larger than in September. Prices are steady.

Cast Iron Pipe.—This market continues dull in the absence either of contractors' awards or public lettings. Several contractors' jobs are in the making, but not much can be expected from municipalities until after the November elections, when a number of bond issues will be voted on. Private buyers find that their needs are covered by scattered orders for a few lengths. Deliveries to the northern part of the country are in good volume, and backlogs resulting from orders from this section are rapidly dwindling. Deliveries are prompt on practically all sizes. Prices for small lots are steady at \$35 to \$37 a ton, Birmingham, for diameters 6 in. and larger. The Lynchburg Foundry Co. is low bidder at Milwaukee at \$36.75, Birmingham, on 100 tons of 8-in., Class C, pipe. This is equivalent to \$45.25, delivered.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, \$43.20 to \$45.20; 4-in., \$47.20 to \$49.20; Class A and gas pipe, \$4 extra.

Cold-Rolled Strip.—Prices have been advanced \$2 a ton, making current quotations 2.85c. to 2.90c. per lb., Cleveland. The freight rate to Chicago is 30c. Specifications, though somewhat lighter than in previous weeks, are about equal to shipments, and deliveries are not better than three weeks.

Reinforcing Bars.—The largest award is 600 tons of rail steel bars for

a housing project in Chicago. Active projects are fully 50 per cent heavier than in September. Some of this prospective business is accounted for by the revival of several old projects. A liberal amount of small work is being let. Backlogs afford five to seven weeks' work. Pressure for deliveries is insistent as cold weather approaches, but shops are meeting requirements except when delayed by the lengthened deliveries from mills. Prices remain unstable, with a leaning toward the weak side, this being especially true of reinforcing bars made from billets.

Hot-Rolled Strip.—Revisions in prices have been made, and quotations now are 2.10c. per lb., Chicago, for widths under 6 in. and 2c. for 6 in. and wider. Shipments from mills are holding up well; deliveries average two weeks.

Structural Material.—Awards during the week totaled 2200 tons. Fresh inquiry is for 4000 tons. Dullness in lettings in recent weeks is now being felt by shops that find backlogs materially reduced. Anxiety to book tonnage is leading to keener competition, with the result that the gain in prices in the early part of the fall has disappeared. Building operations are curtailed, but more generally in the classes of structures that do not call for heavy tonnages of steel. Of special interest is the growing demand for industrial types of buildings. Contracts for steel by fabricating shops are small, it being evident that structural material will be purchased as jobs are taken. Deliveries range from two to five weeks. Prices are steady at 2c. to 2.10c., Chicago.

Mill prices on plain material, per lb.: 2c. to 2.10c. base, Chicago.

Wire Products.—Little change has taken place in this market in the past week. Releases by the manufacturing trade hold at a steady rate, but needs of the jobbers are small and uncertain. Mill output continues larger than shipments, as producers round out and enlarge stocks.

Rails and Track Supplies.—A Western railroad has entered an order for 3000 tons of standard-section rails for

immediate delivery. Backlogs are measurably smaller, but output remains unchanged. Inquiry for rails before the trade is marking time. Several railroads are preparing to come into the market for large tonnages. Orders for track accessories are unusually light and inquiry now in the market is small in total. Users of light rails have entered orders for several carloads.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. Per lb.: Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Sheets.—Mills are bringing a substantial volume of business to the mills. Prices are so strong that in the minds of many in the trade a \$2 a ton advance is near at hand. Specifications continue in sufficient volume to support hot mills at a shade under capacity. Deliveries range from four to five weeks on all grades except box annealed, which can be had in three to four weeks. There is a noticeable drop in demand from the roofing trade. This has come unusually early this year and is accounted for by the lack of demand in rural districts and the fact that manufacturers had built heavy stocks in anticipation of the fall trade.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.90c.; No. 24 galv., 3.65c.; No. 10 blue ann'd, 2.15c. Deliv'd prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Coke.—Prices are firm at \$8 a ton, f.o.b. local ovens. Shipments have grown heavier in the week.

Bolts, Nuts and Rivets.—Prices for these commodities are firm. Small rivets are quoted at 70 and 10 to 70 per cent off list, depending on the size of orders. Specifications are heavier from a wide circle of users.

Old Material.—The Chicago scrap market is strong, notwithstanding that several of the light tonnage grades are coming out on tracks faster than demand warrants. Dealers are said to have paid as high as \$14.75 a gross ton, delivered, for heavy melting steel, and a producer of this grade has been offered above \$15 for a round tonnage of strictly first grade material. Mills are freely offering to take this grade at \$14.50, delivered. On the other hand, steel axles and couplers and knuckles often appear as distress tonnage and can be sold only in outlying parts of the district. In some quarters there is a move to buy further in advance; a user of short rails is willing to place orders for requirements for the next three months. Higher prices have released a considerable quantity of scrap, and dealers, in an effort to move it rapidly, have shipped to mills faster than the cars can be unloaded, with the result that users have been forced to limit consignments. It is observed by some that the inrush of scrap does not necessarily indicate a surplus, but rather that reserves usually on hand at this time of the year are being rapidly reduced and that the potential supply is already below normal. In-

cluded among railroad lists is 5000 tons offered by the Burlington and 1000 tons of relaying rails that will be sold by the St. Paul.

Prices deliv'd Chicago district consumers:

Per Gross Ton	
Basic Open-Hearth Grades:	
Heavy melting steel.....	\$14.00 to \$14.50
Shoveling steel.....	14.00 to 14.50
Frogs, switches and guards, cut apart, and misc. rails	15.50 to 16.00
Hydraul. compressed sheets	12.25 to 12.75
Drop forge flashings.....	9.50 to 10.00
Forg'd, cast and r'l'd steel carwheels	17.25 to 17.75
Railr'd tires, charg. box size	17.25 to 17.75
Railr'd leaf spring cut apart	17.25 to 17.75
Acid Open-Hearth Grades:	
Steel couplers and knuckles	15.75 to 16.25
Coil springs.....	18.25 to 18.75
Electric Furnace Grades:	
Axle turnings.....	14.00 to 14.50
Low phos. punchings.....	16.00 to 16.50
Low phos. plate, 12 in. and under	15.50 to 16.00
Blast Furnace Grades:	
Axle turnings.....	11.00 to 11.50
Cast iron borings.....	11.00 to 11.50
Short shoveling turnings..	11.00 to 11.50
Machine shop turnings....	6.75 to 7.25
Rolling Mill Grades:	
Iron rails.....	14.75 to 15.25
Rerolling rails.....	16.50 to 17.00
Cupola Grades:	
Steel rails less than 3 ft..	17.25 to 17.75
Angle bars, steel.....	16.50 to 17.00
Cast iron carwheels.....	13.75 to 14.00
Malleable Grades:	
Railroad.....	15.25 to 15.75
Agricultural.....	12.50 to 13.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heav.	26.00 to 31.00

Per Net Ton	
Rolling Mill Grades:	
Iron angles and splice bars	14.50 to 15.00
Iron arch bars and transoms	20.50 to 21.00
Iron car axles.....	25.50 to 26.00
Steel car axles.....	16.00 to 16.50
No. 1 railroad wrought...	12.75 to 13.25
No. 2 railroad wrought...	12.50 to 13.00
No. 1 busheling.....	11.00 to 11.50
No. 2 busheling.....	6.00 to 6.50
Locomotive tires, smooth..	13.00 to 13.50
Pipes and flues.....	9.50 to 10.00
Cupola Grades:	
No. 1 machinery cast.....	15.50 to 16.00
No. 1 railroad cast.....	14.50 to 15.00
No. 1 agricultural cast....	14.00 to 14.50
Stove plate.....	11.75 to 12.25
Grate bars.....	12.50 to 13.00
Brake shoes.....	11.75 to 12.25
*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.	

Former Sanderson Company Acquires New Plant

Following the recent purchase of the merchant iron and steel business of the E. P. Sanderson Co., Cambridge, Mass., by Joseph T. Ryerson & Son, Inc., Chicago, the Sanderson company is closing negotiations for the purchase of the neighboring plant of the American Net & Twine Co. and will occupy it for departments of business not included in the sale to the Ryerson company. The Sanderson organization, however, will not operate under the old name, as the Ryerson purchase included the name as well as the good will of the company. The Sanderson heavy hardware and blacksmithing departments and the Cutter & Wood division, devoted to mill supplies, will have increased facilities in the new plant.

Philadelphia

Eastern Mills Still Engaged at High Rate—Reading Divides 30,000-Ton Rail Order—Scrap Higher

PHILADELPHIA, Oct. 23.—Eastern mills continue a high rate of operation, fortified by a heavy volume of specifications against fourth quarter contracts. Bar and plate prices are firm, and the sheet market is strong except for some recently reported concessions of \$1 a ton on black sheets. Structural mills are in a better position as to tonnage than in some months. Plate producers have quoted on an inquiry from a local shipyard for 13,500 tons of plates required for four vessels, awards of which are pending.

Distribution of the 160,000 tons of rails required for next year by the Pennsylvania Railroad has not yet been made. The Reading has placed 30,000 tons of rails, of which 24,000 tons went to the Bethlehem Steel Co. and 6000 tons to the Carnegie Steel Co.

Iron and steel scrap prices continue to advance. A large eastern Pennsylvania plate mill is understood to have closed on a sizable tonnage of No. 1 heavy melting steel at \$16.50 per ton, delivered, an advance of 50c.

Pig Iron.—Sellers are asking \$20.50 per ton, base, on small lots of foundry iron, but \$20, base, is still obtainable on desirable tonnage. Foundries are accepting full shipments on their contracts. Interest in first quarter tonnage is developing; sellers are asking \$20.50 per ton, base, for that delivery. About 20,000 tons of basic iron wanted for first quarter delivery by a large eastern Pennsylvania consumer has not been placed. Low phosphorus demand is improving, and prices are firm. No decision on resuming operation has been reached by the northern New York producer of low phosphorus iron; its yard stocks have been greatly reduced.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	\$20.76 to \$21.26
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.26 to 21.76
East. Pa. No. 1X, 2.17 to 2.26	21.76 to 22.26
Basic (del'd east. Pa.)	19.75
Gray forge	19.75 to 20.25
Malleable	21.00 to 21.50
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. b'r'g low phos. (f.o.b. furnace)	23.00 to 23.50
Va. No. 2 plain, 1.75 to 2.25 sil.	24.54
Va. No. 2X, 2.25 to 2.75 sil.	25.04

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to \$1.64 from eastern Pennsylvania furnaces; \$4.54 from Virginia furnaces.

Billets.—Makers are quoting \$34 per ton, Pittsburgh, on small lots of rerolling billets, but on larger tonnages \$33, Pittsburgh, applies. Forging grade is quoted at \$38, Pittsburgh.

Bars.—Mills have specifications to engage them at their present rate of operation for four to five weeks. Prices are firm at 2c., Pittsburgh, or 2.32c., Philadelphia, on new business, with deliveries on contracts for this quarter at 1.90c. and 1.95c., Pittsburgh.

Shapes.—Operating rates of producers in eastern Pennsylvania are high and specifications on contracts are in good volume. Prices are being maintained quite firmly at 2.05c. to 2.10c., f.o.b. nearest mill, or 2.11c. to 2.16c., Philadelphia, based on Pencoyd, Pa. Fabricating shops are well occupied with contracts and are bidding on

a number of local projects, of size, including a new plant for the Atwater Kent Mfg. Co., the Reading Commercial Building and a hospital. Several thousand tons of material will be required for grade crossing elimination on the Reading Railroad, near Philadelphia.

Plates.—A Camden, N. J., shipyard has asked for prices on 13,500 tons of plates required for four vessels for the American Express Line, on which it is bidding. Quotations on new business are firm at 2.15c., Coatesville. Even preferred buyers are no longer offered tonnage at 2.10c., Coatesville, or 2.20c., Philadelphia. Specifications against contracts are heavy, and mills report a good volume of new business in prospect.

Sheets.—Blue annealed prices are firm at 2c., Pittsburgh, or 2.32c., Philadelphia, and on small tonnages mills are beginning to obtain 2.10c., Pittsburgh. This strength is partly balanced by reports that the 10c. extra on wide sheets is not always obtained when tonnage for a preferred customer is under consideration. Black sheets are quoted at 2.75c., Pittsburgh, or 3.17c., Philadelphia, and a few concessions of \$1 a ton are reported to have been made recently. Galvanized sheets are firm at 3.50c., Pittsburgh, or 3.82c., Philadelphia, and some makers are considering an advance.

Warehouse Business.—October will

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.
Plates, ¼-in. and heavier	2.70c.
Plates, ⅜-in.	2.90c.

†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

evidently show about the same volume of purchasing from warehouse stocks as September. Prices are firm. Jobbers who stock reinforcing bars are endeavoring to eliminate the concessions from 2.80c. per lb., which have been common for a number of months.

Imports.—In the week ended Oct. 20 imports of pig iron were only 125 tons, of which 75 tons was from Norway and 50 tons from Sweden. Ore arrivals were confined to 1960 tons of manganese ore from British India. Steel imports were 75 tons of structural shapes from Germany and 27 tons from France, 99 tons of steel bars and 30 tons of billets from Sweden, 39 tons of wire rods from Germany and 18 tons of steel bands from France.

Old Material.—A large eastern Pennsylvania plate mill is understood to have bought a sizable tonnage of No. 1 heavy melting steel at \$16.50 per ton, delivered, from two Eastern brokers. All grades of scrap continue strong, and it is said by sellers in this district that higher prices in western Pennsylvania should immediately be reflected in this market. Specification pipe has been bought at \$15.50 per ton and couplers and knuckles at \$18 per ton, delivered. Blast furnace scrap is rather inactive, but one broker is paying \$11 per ton, delivered to Swedeland, Pa.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	\$16.00 to \$16.50
Scrap T rails	\$15.50 to 16.00
No. 2 heavy melting steel	13.00 to 13.50
No. 1 railroad wrought	15.50 to 16.00
Bundled sheets (for steel works)	11.50 to 12.00
Machine shop turnings (for steel works)	11.50 to 12.00
Heavy axle turnings (or equiv.)	12.50 to 13.50
Cast borings (for steel works and roll. mill)	11.00 to 11.50
Heavy breakable cast (for steel works)	16.50 to 17.00
Railroad grate bars	13.00 to 13.50
Stove plate (for steel works)	13.00
No. 1 low phos., hvy., 0.04% and under	19.00 to 20.00
Couplers and knuckles	17.50 to 18.00
Rolled steel wheels	17.00 to 17.50
No. 1 blast f'nace scrap	10.00 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	15.00 to 15.50
Shafting	19.00 to 20.00
Steel axles	22.00 to 23.00
No. 1 forge fire	12.50 to 13.00
Cast iron carwheels	16.50 to 17.00
No. 1 cast	17.00 to 17.50
Cast borings (for chem. plant)	14.50 to 15.00
Steel rails for rolling	15.50 to 16.00

Fabricated Steel Plate Orders Smaller

WASHINGTON, Oct. 23.—Orders for fabricated steel plates in September totaled 40,225 tons, or 50.4 per cent of the capacity of the plants of the 51 firms reporting to the Department of Commerce. August orders amounted to 47,245 tons, or 59.9 per cent of capacity. The September orders were distributed as follows: Oil storage tanks, 18,572 tons; refinery materials and equipment, 5021 tons; tank cars, 684 tons; gas holders, 1642 tons; blast furnaces, 386 tons; stacks and miscellaneous, 13,920 tons.

New York

Pig Iron and Finished Steel Gaining Strength—Sales of Bars at 2c. Increasing

NEW YORK, Oct. 22.—The pig iron market continues to show signs of strength. Gains in foundry melt are reflected in requests for deliveries ahead of those scheduled. An increasing number of orders for shipment in the current quarter are being placed by consumers who underestimated their requirements in contracting for this period. Close to 12,000 tons was sold in this territory during the week, most of it supplementary tonnage for delivery in the next two months. Sales of foundry iron continue to be made at \$17, base Buffalo, but a fair tonnage has been closed at an advance of 50c. a ton, some of it for deliveries extending into first quarter. As yet, however, buyers have shown little interest in their next year's requirements and producers are not pressing for business that far ahead. The General Electric Co. has bought 500 tons each for its Lynn and Pittsfield, Mass., plants and 1200 tons for Elmira, N. Y. The Eastern Malleable Iron Co. is inquiring for a total of 1000 tons of malleable for its Troy, N. Y., and Wilmington, Del., plants. The New Jersey Zinc Co., New York, is in the market for 200 tons of No. 1X. About 5000 tons of iron is pending, most of it for shipment in this quarter.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil.	1.75	
to 2.25		\$21.91
*Buf. No. 2, del'd east.		
N. J.		20.28
No. 2, del'd east. N. J.		
tidewater	\$20.01 to	21.25
East. Pa. No. 2 fdy., sil.		
1.75 to 2.25	20.89 to	22.02
East. Pa. No. 2X fdy., sil.		
2.25 to 2.75	21.39 to	22.52
East. Pa. No. 1X fdy., sil.		
2.75 to 3.25	21.89 to	23.02

Freight rates: \$4.91 from Buffalo, \$1.39 to \$2.52 from eastern Pennsylvania.

*Price delivered to New Jersey cities having rate of \$3.28 a ton from Buffalo.

Plates, Shapes and Bars.—Steel bars mills are drawing sharper lines as to what buyers are entitled to the minimum prices. With contract customers covered for the quarter at 1.90c. and 1.95c., Pittsburgh, there has been virtually a withdrawal of the 1.90c. price, and a good many buyers find that they cannot do better than 2c. In plates and shapes, the strength of prices is not so marked, but a good many of the current transactions are at 2.27½c., New York, for plates and at 2.24½c., New York, for shapes, and only the largest buyers are openly getting lower quotations. Even in such cases the minimums are 2.22½c., New York, for plates and 2.19½c. for shapes. The price situation is apparently tending toward quotations of 2c., Pittsburgh, on all three products for first quarter. For Eastern plate and shape mills, this would mean 2.15c., f.o.b. mill, the present small-lot price. Specifications against fourth quarter contracts are in good volume. The first

three weeks of October brought in tonnages equal to those booked in the first three weeks of September, but as the last week of September was considerably ahead of other weeks of that month, and, as there is no prospect that ordering between now and Nov. 1 will be on such a large scale, it is fairly certain that the October total of steel orders in this district will be less than that of September.

Steel for the new Chrysler Building, Lexington Avenue and Forty-second Street, New York, amounting to 16,000 to 17,000 tons, will probably be let within a week. The Harris Structural Steel Co. has been awarded 6000 tons of fabricated steel for New York subways. It appears that orders for about 20,000 tons of steel products, mostly plates, shapes and sheet steel piling, for the Brooklyn water tunnel will not be bought by the general contractor, Patrick McGovern, Inc., until about the first of the year. About 2500 tons of plates will be needed for 15 New York Central barges, on which the Dravo Contracting Co., Pittsburgh, is reported to be low bidder.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.24c. to 2.34c.; plates, 2.22½c. to 2.32½c.; struc. shapes, 2.19½c. to 2.22½c.; bar iron, 2.14c.

Cast Iron Pipe.—Buying is limited to small lots of water pipe and it will be several weeks before the first of the inquiries appear on gas pipe for spring delivery. Several of the larger privately owned utility companies are understood to have estimates of spring requirements of gas pipe ranging from 5000 tons to as much as 20,000 tons. A few sizable tonnages of water pipe are in the market or in prospect. Dallas, Tex., is expected to call for new bids on about 25,000 tons of water pipe. Albany, N. Y., is planning to issue an inquiry soon after election, calling for about 50,000 tons of 48-in. pipe. This will be one of the largest single pipe orders placed in the United States in recent years. At the opening of bids on 14,000 tons of water pipe, by Warwick, R. I., on Oct. 16, the low bid was submitted by Herbert Kennedy Co., New York, representing the Pont-a-Mousson works in France. Award has not yet been made, and the town committee is studying all bids carefully. The Pont-a-Mousson works, which has not appeared recently as an active competitor for pipe tonnage in the United States, has booked some large contracts in foreign markets, including 50,000 tons of 32-in. pipe for Maracaibo, Venezuela and 14,000 tons for Caracas and other cities in that country, 14,000 tons from different Cuban cities and 4200 tons for Athens, Greece.

Prices per net ton, deliv'd New York. Water pipe, 6-in. and larger, \$35.60 to \$36.60; 4-in. and 5-in., \$40.60 to \$41.60; 3-in., \$50.60 to \$51.60; Class A and gas pipe, \$4 to \$5 extra.

Sheets and Strip.—The volume of specifications and new orders for sheets is surprisingly large in view of the recent widespread coverage. Black sheets are firm at 2.75c., Pittsburgh, galvanized are also firm at 3.50c., while blue annealed sheets are at 2c. for sizes up to 45 in. and 2.10c. for over that width. Local representatives of makers of hot and cold-rolled strip steel have received notices of price advances. On hot-rolled strip two base prices have been named—1.90c., Pittsburgh or Cleveland, on wider than 6 in. and 2c. on 6 in. and narrower. The advance on cold-rolled strip is \$2 a ton, making the new quo-

tation 2.85c., Pittsburgh or Cleveland.

Wire Products.—Some makers of wire nails have notified jobbers that hereafter the minimum is \$2.55, Pittsburgh, per keg. Preferred jobbers have been getting a \$2 concession from the open market price. An effort will be made by these mills to establish a \$2.65 price for dealers and consumers in carload lots.

Warehouse Business.—Based on sales in the first three weeks of this month, jobbers in this district report that October will be one of the best months of the year. Demand for structural steel from stock continues heavy, and there is a steady flow of business in black and galvanized sheets. Prices are becoming quite firm. Concessions on sheets are difficult to obtain except when the quantity differentials are applied.

Coke.—Standard furnace coke is strong at \$2.85 to \$3.05 per net ton, Connellsville, and it is becoming more difficult to place orders at the lower price. Standard foundry grade is also slightly stronger, but quotations still range from \$3.50 to \$3.75 per net ton, Connellsville. Standard brands are unchanged at \$4.85 per net ton, ovens, or \$8.56 per net ton, delivered to northern New Jersey, Jersey City and Newark, and \$9.44 per ton to New York and Brooklyn. By-product foundry coke prices are \$9 to \$9.40, Newark or Jersey City, and \$10.06, New York or Brooklyn.

Reinforcing Bars.—A terminal warehouse at Jersey City for the Delaware, Lackawanna & Western Railroad will require 8500 tons of reinforcing bars instead of from 2000 to 3000 as first reported, and is the largest job in this territory for some time. Reinforcing steel for the water tunnel extending through Manhattan from Yonkers to Brooklyn will probably not be bought until after the first of the year. The largest new project is a power plant at Amenia, N. Y.,

requiring about 660 tons. A considerable amount of work has been closed recently, and new inquiries are not coming out to replace the larger jobs in the aggregate of work in prospect. Prices are considered satisfactory.

Old Material.—Except for heavy breakable cast, buying prices of brokers are strong with a tendency to advance. Shipments of breakable cast on contracts have been heavy recently, so that consumers have adequate stocks of this grade and are not seeking prompt delivery on contracts. One consumer in New Jersey has reduced its price 50c. a ton. Specification pipe is being bought at \$15 per ton, delivered Lebanon, Pa., based on a recent purchase by a consumer at \$15.50 per ton. Brokers shipping blast furnace scrap to Swedeland, Pa., are paying \$11 per ton, delivered. No. 1 heavy melting steel is unchanged, although it is reported that a tonnage has been closed by an eastern Pennsylvania mill at \$16.50 per ton, delivered, which is a 50c. advance in the eastern Pennsylvania market.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel.	\$12.00 to \$12.50
Heavy melting steel (yard)	8.75 to 9.50
No. 1 hvy. breakable cast.	12.50 to 13.00
Stove plate (steel works)	8.75 to 9.00
Locomotive grate bars	9.25 to 10.25
Machine shop turnings	8.00 to 8.50
Short shoveling turnings	8.00 to 8.50
Cast borings (blast furn. or steel works)	7.00 to 7.50
Mixed borings and turnings	7.00 to 7.50
Steel car axles	18.00 to 18.50
Iron car axles	25.25 to 26.25
Iron and steel pipe (1 in. dia., not under 2 ft. long)	11.25
Forge fire	8.50 to 9.00
No. 1 railroad wrought	11.75 to 12.25
No. 1 yard wrot., long	10.75 to 11.25
Rails for rolling	11.50 to 12.00
Cast iron carwheels	13.00 to 13.50
Stove plate (foundry)	9.50 to 10.00
Malleable cast (railroad)	10.00 to 10.50
Cast borings (chemical)	11.25
<i>Prices per gross ton, deliv'd local foundries:</i>	
No. 1 machy. cast	\$17.00 to \$18.00
No. 1 hvy. cast (columns, bldg. materials, etc.)	
cupola size	15.00 to 16.00
No. 2 cast (radiators, cast boilers, etc.)	14.50 to 15.50

steel bars at 1.90c., Cleveland. A leading Detroit automobile company which recently bought a round tonnage of steel bars from a Cleveland mill and which often has been able to get a price concession, is understood to have placed its order at 1.75c., Cleveland.

Pig Iron.—The features of the market are price advances on foundry and malleable iron by several of the Lake furnaces and inquiries for a round tonnage of basic iron, the supply of which is not plentiful. A north central Ohio steel plant, which recently was a buyer of basic, has again come in the market, this time for 15,000 to 20,000 tons. One producer has quoted \$17.50, and it seems doubtful whether this grade can be bought at a lower price. The inquiry for 3000 to 5000 tons of basic for the Alliance, Ohio, plant of American Steel Foundries is still pending. One Cleveland producer has opened its books for foundry and malleable iron for the first quarter at \$18, with full silicon differentials, for outside shipment and at \$18.50 for local delivery, a 50c. per ton advance, and has made the same advance for the remainder of the year and has taken some business at the new prices. Another has made the same advance, but is not seeking business, as its present commitments will carry it well through the first quarter. A 50c. a ton advance to \$19 has been made for Michigan delivery for the first quarter. One Lake furnace interest that recently advanced its price to \$18.50 for the coming quarter has made another 50c. advance to \$19 for the remainder of the year. Sales by Cleveland interests increased to 38,000 tons the past week; a large part of this business was for delivery this year. Recent price advances for the first quarter are expected to have a tendency to cause some hesitation on the part of buyers until the prices are well tested. Two inquiries for low phosphorus iron, each for 2000 tons, are pending. While makers are asking \$27, Valley, for small lots, \$26.50 can still be done on round tonnages. Shipments continue heavy in the automotive and other fields aside from jobbing foundries, which are only moderately busy in this territory.

<i>Prices per gross ton at Cleveland:</i>	
N't'n fdy., sil.	1.75 to 2.25 \$19.00
S't'n fdy., sil.	1.75 to 2.25 22.25
Malleable	19.00
Ohio silvery, 8 per cent.	28.00
Basic Valley furnace	17.00 to 17.50
Stand. low phos., V'ley fur.	\$26.50 to 27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Iron Ore.—Sales have dwindled the past week, and buying for shipment this season is practically over. The consumption of Lake ore during September was 4,607,963 gross tons, or a decrease of 153,011 tons, compared with August. This decrease is accounted for by the shorter month. The amount consumed in September last year was 4,089,493 tons. The amount at furnaces Oct. 1 was 29,707,911 tons and the amount on hand at furnaces and Lake Erie docks Oct. 1 was 35,808,367 tons, compared with 39,295,539

Cleveland

Slight Falling Off in Steel Demand—New Base Prices on Hot-Rolled Strip—Pig Iron Advanced

CLEVELAND, Oct. 23.—Some of the mills report a moderate and others quite a sharp falling off in specifications and still others are getting about as many orders as earlier in the month, but for smaller tonnages. A slowing down in the demand was to be expected after the heavy bookings late last month and early in October. Consumers are starting to get shipments against late September specifications, and many will not need to order additional material for some time. There is some recession in the demand for steel from the automotive industry. This is noticeable locally in lighter specifications for steel bars from forge shops. Detroit reports a well sustained demand this month from motor car companies, although it is expected that orders from this source will be more restricted during the next few weeks. There is not much activity in the building field or in other fields that might bring out good-sized orders for special work.

An order for half of a Texas pipeline requiring 6000 tons of plates has been placed with the Biggs Boiler Works, Akron. An Eastern mill will supply the steel. The Detroit, Toledo & Ironton Railroad is inquiring for 13,000 tons of rails.

The market has become well stabilized at recent prices. Outside mills are holding fairly firmly to 1.95c., Pittsburgh, for steel bars, plates and structural material and to 1.95c. to 2.05c. for steel bars when quoting on a Cleveland base. Local mills quote

tons on the same date a year ago. Central district furnaces during September consumed 2,429,655 tons, an increase of 51,713 tons. Lake front furnaces used 2,016,566 tons, a decrease of 201,452 tons. All-rail furnaces consumed 91,698 tons, a decrease of 1481 tons, and Eastern furnaces used 70,044 tons, a decrease of 1791 tons. There were 161 furnaces using Lake ore in blast Sept. 30, an increase of six for the month. The late season ore movement promises to be heavy. With a promising outlook in the iron and steel industry, the two leading ore shippers have materially increased shipping orders with outside vessel companies.

Strip Steel.—Specifications for hot-rolled strip continue fairly heavy. The new card of extras has been rather generally adopted. Mills using these extras are quoting two base prices, 2c., Pittsburgh, for widths to 6 in., inclusive, and 1.90c. for strip over 6 in. The new card will not apply to much fourth quarter business, as most consumers are covered for the present quarter. Cold-rolled strip is firmer. One producer has announced 2.85c., Cleveland and Pittsburgh, as its minimum price and another has advanced to a flat 2.95c. price. However, some of the mills are still quoting 2.75c. for round lots.

Fluorspar.—The 50 per cent advance in the duty on gravel fluorspar, made by Presidential proclamation and effective Nov. 19, will, in the opinion of domestic producers, shut out of the Pittsburgh district foreign fluorspar used in the steel making industry. Imported fluorspar is shipped on a gross ton basis, but is figured on a net ton basis in the domestic market to conform with the method of marketing the domestic material. The advance increases the duty from \$5 to \$7.50 per net ton and covers fluorspar with 93 per cent and less of calcium fluoride, so that the increased duty applies only to the gravel fluorspar. Consumers in the Pittsburgh district use 10,000 to 12,000 tons of gravel fluorspar per annum, and competition for this business between the foreign and domestic grades frequently has had a tendency to depress the price of the latter. Previous to the announcement of the tariff advance, the gravel fluorspar market developed a firmer tone, with at least one producer holding for a \$1 a ton advance to \$18, mines. The price for next year has not yet been named.

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.

Com. wire nails, base per keg.....	2.85

*Net base, including boxing and cutting to length.

Sheets.—Specifications are heavy and some of the mills are having difficulty in satisfying delivery demands. On automobile body sheets, several mills are not promising shipments before Dec. 1. The market is firmer and little is heard of price concessions. Blue annealed sheets are out of line with plate prices, and, as a result, some consumers who ordinarily use plates are substituting sheets, as these in 3/16-in. in the narrower widths are \$4 a ton cheaper than corresponding plate material.

Cold-Finished Bars.—Orders for screw machine parts for the new models of Chevrolet cars are being placed and these are stimulating the demand for cold-finished bars. Business as a whole is less than in September, as the price advance brought out liberal specifications late last month against expiring contracts. Prices are firmer.

Semi-Finished Steel.—The leading local producer announces that it has sold its entire merchant output for the fourth quarter at the prices recently named. Specifications are heavy against contracts.

Wire Products.—Nails and wire are in light demand. Regular prices appear to be well maintained in this territory.

Reinforcing Bars.—Small lots are in fair demand, but otherwise the market is dull. Prices are irregular. For mill orders, 1.85c., Pittsburgh, evidently can still be done.

Warehouse Business.—The volume of business shows some decline. Orders are as numerous as earlier in the month, but for smaller lots. Sheets are in good demand.

Coke.—Ohio by-product foundry coke has been reestablished at \$7.75 per ton, Painesville, for November shipment. By-product coke for domestic use is moving fairly well, and a general price advance of 50c. a ton is expected Nov. 1. At present egg coke

is quoted at \$5, Cleveland, for outside, and at \$4.50, Valley ovens.

Bolts, Nuts and Rivets.—Bolt and nut makers report a slight improvement in orders. Good specifications are coming from the automotive and farm implement industries and from jobbers. Prices are firm. The demand for rivets is steady, but moderate.

Old Material.—The local market continues quite active and firm, but prices are no higher than a week ago, and there is a slight indication of an easier market tone. For delivery to local mills against outstanding orders, dealers are paying the quoted prices and are getting all the scrap they need. In the Youngstown district, heavy melting steel and compressed sheet scrap are bringing \$16.50 to \$16.75 from dealers. A local dealer was able to buy a small tonnage of heavy melting steel from a Pittsburgh district broker at \$17.50, or the same price that the latter was paying a week ago.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades		
No. 1 heavy melting steel.....	\$14.00 to	\$14.50
No. 2 heavy melting steel.....	13.25 to	13.50

New Electrolytic Zinc Plant at St. Louis

ST. LOUIS, Oct. 20.—Announcement has been made by officials of the Evans-Wallower Lead Co. of plans for the erection in East St. Louis, Ill., of a plant for the production of electrolytic zinc, which, already under construction, will be located adjacent to the plant of the Monsanto Chemical Works and the Cahokia power plant of the St. Louis Union Electric Co., from which the power will come.

The plant has been designed to use low-grade Western concentrates with the recovery of by-products. However, in periods of over-production in the tri-State district, zinc concentrates from Joplin, Mo., will be used. The effect of operation of a plant of this kind, it is said, will be to stabilize the markets for concentrates and metals rather than disturb the balance between output and consumption.

The electrolytic process to be used

is stated to make a higher grade of zinc than any now on the market and, as announced by the Bunker Hill Co., will approximate 99.99 per cent purity. Chief among the uses of the metal will be in the brass and die casting industries. By-products will include cadmium, manganese dioxide used in the manufacture of dry cells, and lead. The new plant of the Evans-Wallower Lead Co. probably will be operated through a subsidiary known as the Evans-Wallower Zinc Co., and will operate on the Tainton process of electrolytic deposition of metal from the roasted zinc concentrates.

A second order for a 17-ton iron ore unloader has been placed by the Bethlehem Steel Co. with the Wellman-Seaver-Morgan Co., Cleveland. This will be a duplicate of an unloader bought a few weeks ago. Both machines will be erected at the Lackawanna plant of the Bethlehem company at Buffalo.

San Francisco

Pipe Line in Oregon Takes 1200 Tons of Plates—Steel Business Mostly in Small Orders

SAN FRANCISCO, Oct. 20 (By Air Mail).—Little of importance occurred in the Coast markets for iron and steel products the past week, the majority of both sales and inquiries involving lots of less than 100 tons. The largest award called for 1200 tons of plates for a pipe line at Hood River, Ore., booked by the Steel Tank & Pipe Co.

Pig Iron.—Foundry operations in southern California have improved to some extent, owing to the activity in the Santa Fe Hills oil fields, and demand for pig iron is increasing. However, inquiries and sales have involved small lots.

Prices per gross ton at San Francisco:

*Utah basic		\$25.00 to \$26.00
*Utah fdy., sil. 2.75 to 3.25		25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25		24.00 to 25.00

*Delivered San Francisco.

**Duty paid, f.o.b. cars San Francisco.

Bars.—Only two awards exceeding 100 tons of reinforcing steel bars were reported this week. The larger, 435 tons, for the Balboa High School in San Francisco, went to the Pacific Coast Steel Co. An unnamed interest took 200 tons for an apartment on South Hobart Street, Los Angeles. A fair volume of pending business is being figured. Out-of-stock prices on reinforcing steel bars continue low, and 1.80c., base, is general. On merchant bars the price appears firm at 2.35c., c.i.f.

Plates.—The only sizable plate award of the week went to the Steel Tank & Pipe Co., Portland, Ore., and called for 1200 tons for a pipe line at Hood River, Ore. Bids will be opened next week on 231 tons of 24-in. riveted pipe for Seattle. The Shell Oil Co. has taken no action on its inquiry for 3100 tons for 10 80,000-bbl. tanks for its Domingues refinery. Prices are unchanged at 2.20c. to 2.25c., c.i.f. Coast ports.

Shapes.—No structural steel awards exceeding 100 tons were reported during the week, and no inquiries of importance developed. The War Department has approved the modified plans and has granted the Southern Pacific a permit to construct a bridge, over a mile long, across the Carquinez Straits at Martinez, Cal. While no

definite estimate of the steel tonnage has yet been given out, the bridge will require about 20,000 tons. Plain material continues firm at 2.35c., c.i.f. On foreign shapes, 1.57c., c.i.f., duty paid, appears to be the lowest quotation.

Cast Iron Pipe.—A slight improvement in demand for cast iron pipe is noticed, but there were few awards during the week. The United States Cast Iron Pipe & Foundry Co. took 1095 tons of 20-in. pipe for a high-

pressure system in Honolulu. Los Angeles opened bids this week on approximately 2000 tons of 6 and 8-in. centrifugal pipe, and Honolulu has taken bids on 700 tons of 12 to 24-in. pipe. Bids will be opened Nov. 5 on 106 tons of 4 to 10-in. Class B pipe for the improvement of Turquoise Street, San Diego, Cal. Bids go in next week on 1284 tons of 24-in. Class B pipe for Seattle; alternate bids are being taken on riveted pipe.

Coke.—Movement of foundry coke has not been heavy. About 4500 tons of English coke is scheduled to arrive on the Coast about the middle of November. English by-product coke is quoted at from \$11.50 to \$13 a net ton, incoming dock, while beehive coke is held at \$16 a net ton.

Boston

Pig Iron Firm—A 50c. Advance Quoted for First Quarter—Scrap Market Strong and Active

BOSTON, Oct. 23.—Strict adherence to quoted prices by Buffalo furnaces has brought a firm pig iron situation in New England. Buffalo interests have been endeavoring to get 50c. a ton additional on iron for first quarter. While little business has been done for that delivery, the quoting of a higher price reflects the strong attitude of Buffalo producers. More than 3000 tons was sold the past week, divided between the Mystic and Buffalo furnaces. Inquiries for more than 1000 tons may be closed soon.

Foundry iron prices per gross ton deliv'd to most New England points:

*Buffalo, sil. 1.75 to 2.25		\$21.91
*Buffalo, sil. 2.25 to 2.75		\$21.91 to 22.41
†Buffalo, sil. 1.75 to 2.25		20.78
†Buffalo, sil. 2.25 to 2.75		20.78 to 21.28
East. Penn., sil. 1.75 to 2.25		23.65
East. Penn., sil. 2.25 to 2.75		24.15
Va., sil. 1.75 to 2.25		25.71
Va., sil. 2.25 to 2.75		26.21
Ala., sil. 1.75 to 2.25		23.16 to 25.02
Ala., sil. 2.25 to 2.75		23.66 to 25.52

Freight rates: \$4.91 all rail and \$3.78 rail and water from Buffalo; \$3.65 from eastern Pennsylvania; \$5.21 all rail from Virginia, \$6.91 to \$8.77 from Alabama.

*All rail rate. †Rail and water rate.

Reinforcing Bars.—For the Packard Motor Building, 150 tons of bars was placed with the Truscon Steel Co., and Joseph T. Ryerson & Son, Inc., was awarded 180 tons for a mercantile building on Brookline Avenue.

Coke.—Foundries continue to place orders in good volume, showing that pig iron melt is substantial. Local producers expect a good business during the next month or six weeks.

Old Material.—Demand from Pittsburgh mills keeps the local scrap market busy. In addition, there is buying for export. About the last of the month a 5000-ton shipment will leave for Danzig. In view of the fact that Pittsburgh mills have taken so much scrap in the past month, there is a scarcity in some lines. No. 1 heavy melting steel has advanced again, and now is bringing \$11.50 to \$12, f.o.b. cars here, while No. 2 steel strengthened to \$10 to \$10.50. The Worcester mill has bought heavy melting steel at

\$13.50 to \$14, delivered. Turnings have advanced to \$7 to \$7.50.

Buying prices per gross ton, f.o.b. Boston rate, shipping points:

No. 1 heavy melting steel		\$11.50 to \$12.00
Scrap T rails		10.00 to 10.50
Scrap girder rails		9.50 to 10.00
No. 1 railroad wrought		10.50 to 11.00
No. 1 yard wrought		8.00 to 8.50
Machine shop turnings		6.25 to 6.75
Cast iron borings (steel works and rolling mill)		6.50 to 7.00
Bundled skeleton, long		8.50 to 9.00
Forge flashings		9.00 to 9.50
Blast furnace borings and turnings		7.00 to 7.50
Forged scrap		6.50 to 7.00
Shafting		14.50 to 15.00
Steel car axles		16.00 to 16.50
Wrought pipe 1 in. in diameter (over 2 ft. long)		9.50 to 10.00
Rails for rolling		10.50 to 11.00
Cast iron borings, chemical		9.50 to 10.00

Prices per gross ton deliv'd consumers' yards:

Textile cast		\$14.00 to \$14.50
No. 1 machinery cast		15.50 to 16.00
No. 2 machinery cast		13.50 to 14.00
Stove plate		10.50 to 12.50
Railroad malleable		15.00 to 15.50

St. Louis

Increase in Pig Iron Buying—Some Sales for First Quarter —Scrap Continues to Advance

ST. LOUIS, Oct. 23.—Buying of pig iron took a spurt the past week, the St. Louis Gas & Coke Corporation selling 15,400 tons, more than 3500 of which was for shipment in the first quarter. These were the first sales for next year's delivery. The market is firm, and an advance of 50c. a ton is expected by the local maker, whose shipments for October give promise of being the largest in its history. An important factor in the increasing melt in this district is the stove industry, which is unusually busy. A large part of a lot of 5000 tons of foundry iron bought by a local broker is expected to go to stove manufacturers. Two Belleville stove foundries bought 2500 tons and 500 tons of foundry iron respectively for first quarter, while a third in that center bought 150 tons for prompt delivery. A local stove plant took 500 tons for prompt delivery. St. Louis jobbing foundries took 1700 tons, including a lot of 1200 tons for first quarter. All of the sales were of foundry grades, except 2000 tons of malleable to an Illinois melter for first quarter.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b.	
Granite City, Ill.	\$19.50 to \$20.00
N'th'n No. 2 fdy., deliv'd St. Louis..	20.16
Southern No. 2 fdy., deliv'd	20.67
Northern malleable, deliv'd	20.16
Northern basic, deliv'd	20.16

Freight rates: 81c. Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Coke.—Foundry coke is being consumed in larger quantities, but buying continues on a small scale.

Finished Iron and Steel.—Specifications for plates, shapes and bars continue in fairly large volume. Business in galvanized sheets has slumped considerably, largely because most buyers placed orders before the discount reduction. Structural fabricators report business extremely dull, with no projects of consequence in sight. Reinforcing bar buying is light; the only letting of the week was 300 tons to the Laclede Steel Co. for a warehouse and office building. Warehouse busi-

ness made a good start this month, but fell off somewhat during the last 10 days.

Old Material.—Three of the largest consumers in the St. Louis industrial district came into the market, buying a total of about 15,000 tons of old material for delivery over the next 60 days. The purchases were distributed among a number of dealers, and consisted of heavy melting and shoveling steel, rails and specialties. While dealers' stocks are low, old material is being offered more freely by country dealers. The recent heavy buying gave added strength to the market here, and advances were recorded in heavy melting steel, heavy shoveling steel, miscellaneous standard-section rails, No. 2 railroad wrought, No. 1 railroad wrought, steel angle bars, No. 1 machinery cast and stove plate. The Frazier-Davis Construction Co. will buy 400 tons of 80-lb. relaying rails for use on the approach to the

St. Louis municipal bridge. Railroad lists include: International & Great Northern, 640 tons; Chicago & Alton, 810 carloads; Chicago, Rock Island & Pacific, 161 carloads; Chicago, Milwaukee, St. Paul & Pacific, 43 carloads; and Frisco, 27 carloads.

Dealers' buying prices, per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel.....	\$13.00 to \$13.50
No. 2 heavy melting or shoveling steel.....	12.00 to 12.50

Agricult. malleable.....	11.50 to 12.00
Relay. rails, 60 lb. and under	20.50 to 23.50
Relay. rails, 70 lb. and over	26.50 to 29.00

Canada

Pig Iron and Steel Production in Dominion Has Shown Large Gains This Year

TORONTO, ONT., Oct. 23.—The production of iron and steel in Canada continues to increase. September production of pig iron totaled 90,516 tons, which was slightly under the 91,522 tons in August, but was almost double the 52,470 tons produced in September, 1927. Compared with August, September figures showed increases in tonnage of basic and foundry grades, but these were not sufficient to offset the decline in production of malleable iron. Output of basic iron advanced to 57,424 tons from 54,826 tons in August; foundry iron, at 21,292 tons, compares with 15,210 tons in August, and malleable iron dropped from 21,481 tons in August to 11,800 tons in September. For the nine months ended with September, pig iron production totaled 745,473 tons, an increase of 31 per cent over the 570,414 tons reported for the first nine months of 1927, and 46 per cent greater than the output of 496,876 tons produced in the corresponding period of 1926.

Production of ferroalloys in Canada fell off sharply in September to 2008 tons from 2537 tons in August. For the nine months' period, production totaled 33,414 tons, a decline of 28 per cent from the 42,834 tons produced in the corresponding nine months of 1927.

September production of steel ingots and direct steel castings amounted to 99,888 long tons, an increase of 13 per cent over the 88,677 tons produced in the previous month and 84 per cent greater than the 54,250 tons reported for September, 1927.

Output of steel ingots and direct steel castings for the nine months ended with September totaled 919,710 long tons. This tonnage was 36 per cent over the 674,289 tons reported for the corresponding nine months of 1927, which in turn was 12 per cent greater than the 600,542 tons produced in the first three quarters of 1926. This year's output to date included 888,039 tons of steel ingots and 31,671 tons of direct steel castings.

Pig Iron.—A strong demand continues to feature business in this market. Buyers are showing keen interest and are placing orders for small lots, mostly for immediate needs, although some are ordering for late fall and early winter. Spot orders of from 50 to 300 tons were closed during the week, with total sales running about 1200 tons. Prices are holding firm.

Prices per gross ton:

Delivered Toronto

Randall, 675 Richards Street, Vancouver, B. C.; 200 tons for warehouse for Northern Electric Co., Ltd., 313 Water Street, Vancouver, B. C.; 150 tons for office building for the Coast Investment Corporation, Ltd., 425 Howe Street, Vancouver, B. C.

Old Material.—Transactions in iron and steel scrap continue in good volume in the Toronto and Montreal markets. Sales for the week were well up to the high level for the year, but were almost entirely for spot delivery.

With consumers showing more interest in the market, and winter weather only a short distance away, dealers are giving attention to yard supplies. Buying by the local dealers has increased and some large tonnages are going into yards for winter distribution. Some purchases of large tonnages recently were at 50c. per ton above the general market.

Detroit

Fourth Quarter Automobile Production Will Break All Records—No Major Recession in Sight

DETROIT, Oct. 23.—Prospects for a continuance of the present highly satisfactory conditions in the automotive industry are good. Apparently, fourth quarter earnings and fourth quarter production will break all records. There may be temporary slackening up about the first of 1929, but such a movement should not prove serious.

The employment barometer of the Employers' Association has again turned upward after several weeks of recession. The present total is 293,563, an increase of 553 over the figure reported a week ago. This compares with 195,295, the figure of a year ago. The employment figure for the 51 large plants in Toledo, as of Oct. 5, shows 36,314—a 445 unit increase over the preceding week and an increase of 13,743 over the corresponding week in 1927.

Every assembly plant in the Ford organization is now in operation, and production is running at 5500 units a day, with reasonable assurance that the previous production record on Model T cars will be equaled. Approximately 500,000 cars and trucks have been produced by the Ford plants since the first of the year. It is said that the Ford organization can turn out 10,000 units a day without further additions of equipment. Ford still has about 600,000 unfilled orders on the books. Approximately 125,000 employees are working in the Detroit plants.

The production schedule at Willys-Overland plant is based on an output for the current month of between 22,000 and 25,000 units, which will exceed the September production of

22,000 units. About 1100 cars per day are being turned out by this organization.

The 1927 production of the Marmion Motor Car Co. has already been exceeded in the first nine months of the current year by 4000 units. Total production to Oct. 1 was about 16,000 units.

The Packard Motor Car Co., to Oct. 1, had shipped 37,033 cars, an increase of approximately 53 per cent over the 1927 figure to that date.

The Murray Body Co. has practically completed a program for increasing capacity from 425 bodies a day to approximately 900. All units are operating at capacity.

The Fisher Body Corporation is planning a production of 1,250,000 Chevrolet bodies in its Cleveland plant during the coming year. The plant is now down for inventory.

The Chrysler Corporation of Canada has bought 67 acres between Ford City and Walkerville, Ont., for the erection of a plant to cost approximately \$1,500,000. The present plant in Windsor will be used to turn out parts. Approximately 360 cars per day will be the capacity of the new plant.

The Hayes Body Corporation is preparing for a 1929 schedule of something over \$20,000,000 worth of bodies.

The Motor Wheel Corporation is contemplating an expansion program which will include a new building 220 ft. square for the production of wire wheels. This will bring the wire wheel capacity to 6000 a day. Another building 200 x 400 ft. will be used for hub manufacture.

Birmingham

Steel Orders, Excepting Rails, Keep Mills Busy

BIRMINGHAM, Oct. 23.—Pig iron buying* is confined to small lots for early needs. Several of the larger melters are covered for the fourth quarter, but a portion of the iron for this period is yet to be sold. Inquiries are light and involve small tonnages. Shipments are falling a little below production for the first time in several weeks. No change has been made in furnace operations since Oct. 7. Of the 18 in blast, 15 are on foundry, two on basic and one on ferromanganese.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.....	\$16.25
No. 1 fdy., 2.25 to 2.75 sil.....	16.75
Basic.....	16.25

Finished Steel.—The market is characterized by a strong demand and a good run of orders in all lines except steel rails. The rail mill of the Tennessee company has been closed down during the past few weeks owing to lack of business. Rail inquiries the past week were better than in any recent week. Other mill operations are at a high rate. Mills are unable to supply the demand for sheets. Bars, plates and shapes are stronger than at any time in months. Prices are unchanged, and mills are holding closely to quotations. Structural steel fabricators have sufficient business to keep them busy for several weeks. Reinforcing bar orders are coming in well. Open-hearth operations have been the same during the past two weeks; the Tennessee company is operating seven at Fairfield and the Gulf States Steel Co. four at Alabama City. The Tennessee company will place some of its open-hearths at Ensley in operation this week.

Cast Iron Pipe.—Several small orders are being booked, but the total tonnage is light. Plants continue to operate at about the same rate, but unfilled tonnage is less than half that of a month ago. Shipments are fair, and very little pipe has been stocked this month. Quotations are unchanged from \$36 to \$37 on 6-in. and larger sizes.

Coke.—Foundry coke is moving in fair volume. Quotations are unchanged from the \$5 base for both spot and contract coke.

Old Material.—An undertone of strength continues, and demand is better than at any time this year. Prices are unchanged. Pressure for delivery continues strong, and shortages have developed in some lines.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel.....	\$12.50
Scrap steel rails.....	\$12.00 to 12.50
Short shoveling turnings..	8.00 to 8.50
Cast iron borings.....	8.00
Stove plate.....	13.50
Steel axles.....	19.00 to 20.00
Iron axles.....	21.00 to 22.00
No. 1 railroad wrought...	10.00 to 10.50
Rails for rolling.....	14.00 to 15.00
No. 1 cast.....	15.00
Tramcar wheels.....	13.00 to 14.00
Cast iron carwheels.....	13.00 to 13.50
Cast iron borings, chem...	13.50 to 14.00

Cincinnati

Pig Iron Sales Decline But Prices Are Steady—Steel Specifications Are in Smaller Volume

CINCINNATI, Oct. 23.—Pig iron sales have fallen off the past week, although shipments to consumers on current contracts are in normal volume. The only important sale was 750 tons of Northern foundry iron to a Springfield, Ohio, melter by a Lake Erie producer. Most buyers in this district have contracted for their needs for the remainder of the year, and inquiries for the early part of 1929 are scarce. Prices are firm, with northern Ohio sellers quoting a minimum of \$17.50, base furnace. Southern iron is unchanged at \$16.25, base Birmingham. The only Ironton, Ohio, furnace interest which has iron to offer is asking \$17.50, base furnace.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25.....	\$19.39
Ala. fdy., sil. 1.75 to 2.25.....	19.94
Ala. fdy., sil. 2.25 to 2.75.....	20.44
Tenn. fdy., sil. 1.75 to 2.25.....	19.94
S'th'n Ohio silvery 8 per cent.....	26.89

Freight rates, \$1.89 from Ironton and Jackson, Ohio; \$3.69 from Birmingham.

Coke.—The coke market continues active, and users are taking liberal quantities of by-product foundry coke on contracts. Beehive foundry coke from the Wise County and New River districts also is moving at a fairly good rate. By-product foundry coke is steady at \$7 per net ton, f.o.b. ovens, or \$9.14, delivered Cincinnati, and this price is expected to stay in effect through November. The schedule for domestic grades, however, may be advanced 50c. a ton on Nov. 1.

Finished Material.—District sheet mills report that specifications and orders declined slightly the past week, but indications are that the decrease will be more than offset by the substantial volume of incoming business this week. Shipments this month are about paralleling production, and unfilled tonnage assures 100 per cent mill operations for at least two weeks. Demand remains unusually well balanced. The release of specifications by automobile makers getting into production on new models should aid substantially in keeping the market strong. The roofing season in the South has

been fully up to normal, largely because of favorable weather. Prices are well established at 2.75c. to 2.85c., base Pittsburgh, for black, 2c. for blue annealed and 4c. for automobile body sheets. Bars, structural shapes and plates are quoted at 1.95c. to 2c., base Pittsburgh, but bookings in October have been considerably less than in September, when consumers were taking out sizable tonnages on third quarter contracts. In wire goods there has been an improvement in sales. Common wire nails are unchanged at approximately \$2.69 per keg, delivered Cincinnati.

Old Material.—While district steel mills are not anticipating future requirements by making purchases of scrap, prices continue firm, with cast iron grades and rail items advancing 25c. to 50c. a ton on account of a shortage in yard stocks.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel.....	\$13.50 to \$14.00
Scrap rails for melting....	14.00 to 14.50
Loose sheet clippings....	9.50 to 10.00
Bundled sheets.....	10.25 to 10.75

No. 1 machinery cast....	18.00 to 18.50
No. 1 railroad cast.....	14.25 to 14.75
Burnt cast.....	10.50 to 11.00
Stove plate.....	10.50 to 11.00
Brake shoes.....	10.25 to 10.75
Railroad malleable.....	13.50 to 14.00
Agricultural malleable....	12.50 to 13.00

Buffalo

Pig Iron Inquiries Include Some for First Quarter—Steel Plants Busy—Scrap Goes Higher

BUFFALO, Oct. 23.—A strong tone is apparent in the pig iron market. Inquiries are more numerous, and the total is about 4500 tons of all grades, with a 1000-ton lot of malleable heading the list. A 900-ton inquiry for foundry iron and two for 500 tons each are also active. A malleable inquiry for 700 tons is accompanied by one for 300 tons of low silicon foundry and 100 tons of high silicon foundry. Several 100 to 200-ton lots are also up for bidding. Among the inquiries are some lots for the first quarter, the first real interest exhibited in that delivery. No pig iron was shipped on the barge canal last week. Prices are holding firm.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25.....	\$17.00 to \$18.00
No. 2X fdy., sil. 2.25 to 2.75.....	17.50 to 18.50

Malleable, sil. up to 2.25.....	17.50 to 18.50
Basic.....	17.00 to 17.50
Lake Superior charcoal....	27.28

Old Material.—No. 1 heavy melting steel is now at \$16.75 to \$17, some substantial sales having been made at \$16.75 and smaller sales at \$17. A local dealer is reported to have purchased a tonnage of No. 1 heavy melting steel at Bradford, Pa., for \$15.75, on cars. Four markets now exist here for blast furnace borings and turnings, and several sales are reported at \$12. Stove plate is stronger, a sale having been made to a district foundry

dry at \$15.50. Some sales of knuckles and couplers, rolled steel wheels and short steel rails at \$17.75 have been made. The Pittsburgh district is offering \$18 for No. 1 heavy melting steel. Considerable No. 2 steel is reported as going to Pittsburgh from this district.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades	
No. 1 heavy melting steel.....	\$15.75 to \$17.00

body and 3.50c. to 3.60c. for galvanized. Automobile body sheet business is still holding at capacity of the local mill. A 250-ton State building at Napanoch, N. Y., went to the Kellogg Structural Steel Co.; also several miscellaneous jobs of less than 100 tons of fabricated steel have been

awarded. Bolt and nut business is exceptionally good, though jobbers' orders are lighter. The Donner Steel Co. is operating eight of its nine open-hearths; Bethlehem's Lackawanna plant, 23 out of 24 open-hearths; Seneca Iron & Steel Co., 95 per cent, and Buffalo Bolt Co., 75 per cent.

Railroad Equipment

Chicago, Rock Island & Pacific Inquires for 2750 Cars— Pennsylvania to Build 1000 Box Cars

WITH the Chicago, Rock Island & Pacific inquiring for 2750 freight cars, the Canadian National asking for bids on 1500 cars in addition to its previous wants and the Buffalo, Rochester & Pittsburgh soon expected to enter the market for 1000 box cars, the railroad equipment market is showing the most activity in several months. Outstanding orders during the week were given to company shops, the Pennsylvania having placed 1000 box cars and the Chicago, Indianapolis & Louisville, 100 of a similar type.

Chicago, Rock Island & Pacific has inquired for 1000 50-ton steel underframe, single-sheathed box, 500 40-ton stock, 1000 gondola and 250 flat cars. Road is soon expected to enter market for 250 ballast cars.

Canadian National is inquiring for 1000 automobile and 500 40-ton refrigerator cars. This is in addition to its recent inquiry for 1500 box, 300 flat and 30 tank cars.

Buffalo, Rochester & Pittsburgh is expected to enter market for 1000 box cars and 25 locomotives.

New York Central is asking for bids on rebuilding for 50 70-ft. steel underframe coaches.

Chicago, Burlington & Quincy will build 20 all steel suburban coaches, one dynamometer car and 11 trailers at its Aurora, Ill., shops.

Pennsylvania Railroad will build 1000 steel box cars at its Altoona, Pa., shops.

Chicago, Indianapolis & Louisville will build 100 box cars in its own shops.

Chicago & North Western is inquiring for 100 caboose cars.

Canadian Pacific is building 25 caboose cars in its own shops.

Lazote, Inc., Wilmington, Del., has ordered 25 tank cars from General American Tank Car Corporation.

Barrett Co. has ordered six tank cars from General American Tank Car Corporation.

Pennsylvania Railroad, through its associated company, Transcontinental Air Transport, Inc., has ordered 10 trimotored monoplanes for combined rail and air service between Atlantic and Pacific coasts from Ford Motor Co.

Cleveland Union Terminals Co. has ordered unstated number of electric locomotives from General Electric Co.

Manufacturers Railway, St. Louis, will purchase two eight-wheel switching locomotives.

cent report a shortage of skilled workers and 2 per cent note an unsatisfied demand for unskilled labor. In 1927 8 per cent reported a shortage of skilled workers, and 2 per cent, of unskilled labor. Wage increases since last fall are reported by 77.4 per cent, of whom 4.5 per cent note large increases and 72.9 small, while among those reporting decreases 22.4 per cent note small reductions. In 1927 27 per cent reported large and small decreases. Increased production over the previous year is reported by 65 per cent, compared with 50 per cent so reporting last year; greater sales quantities are reported by the same percentage of replies, compared with 49 per cent noting increased sales volume in 1927, and higher sales values are noted by 52 per cent, as against 38 per cent so reporting in 1927.

Reinforcing Steel

Railroad Warehouse Will Take 8500 Tons

ADDITION of 5500 tons to the previous requirements for a railroad terminal warehouse at Jersey City brought the total of new projects reported during the last week to 6700 tons. The following awards of 4100 tons include none of outstanding size:

BROOKLYN, 300 tons, subway section 5, route 107 under Schermerhorn Street; from Necaro Co., Inc., general contractor, to Concrete Steel Co.

BROOKLYN, 500 tons, building for Brooklyn Ash Removal Co., Inc., to Truscon Steel Co.

CRANFORD, N. J., 330 tons, grade separation work for Central Railroad of New Jersey, to Joseph T. Ryerson & Son, Inc.

CHICAGO, 275 tons of rail steel bars, apartment building at Seventy-third Street and South Shore Drive, to Inland Steel Co.

CHICAGO, 600 tons of rail steel bars, negro housing project, to an unnamed bidder.

CHICAGO, 500 tons of rail steel bars, Hodgson Building, to Inland Steel Co.

CHICAGO, 100 tons of rail steel bars, garage on Madison Street, to an unnamed bidder.

CHICAGO, 700 tons, Powhatan Hotel, to American System of Reinforcing.

ST. LOUIS, 200 tons, office building and warehouse for N. O. Nelson Mfg. Co., to Laclede Steel Co.

LOS ANGELES, 200 tons, apartment building on South Hobart Street, to unnamed interest.

SAN FRANCISCO, 435 tons, Balboa School, to Pacific Coast Steel Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

AMENIA, N. Y., 660 tons, power plant development; M. Kantrawitz, Albany, N. Y., general contractor.

JERSEY CITY, 8500 tons, terminal warehouse for Delaware, Lackawanna & Western Railroad Co.; previously reported as 3000 tons.

CINCINNATI, 300 tons, building for Union Gas & Electric Co.

AKRON, OHIO, 200 tons, Wiener Building.

CHICAGO, tonnage not stated, Nurses' Home, for Cook County Hospital.

CHICAGO, 200 tons, apartment building; R. DeGoyer, architect.

ST. LOUIS, 200 tons, Deaconess Hospital, Clayton and Oakland Avenues.

Survey Finds Business Improved

Reports from 4000 Manufacturers Indicate Prosperous Conditions with 94 Per Cent Reporting Favorable Outlook

PRESENT business, immediate trade prospects, inventories, employment conditions, demand for labor, the wage scale paid and the degree of industrial peace enjoyed by industry all show an improvement over last year, according to a survey by the National Association of Manufacturers made public at the organization's annual convention, which was held Oct. 22 to 24 in New York. Based upon replies to a questionnaire received from about 4000 companies since Oct. 1, the survey presents a current picture.

A summary of the survey shows that present trade is reported as favorable by 93 per cent of those reporting, of whom 17.3 per cent pronounce it excellent, 41.4 per cent good, 34.5 per cent fair and 6.8 per cent poor. In 1927 the percentage of favorable returns was 91 per cent. Even better are the expectations for winter trade, 94 per cent of the replies viewing prospects as favorable. Excellent prospects are reported by 14.3 per cent, good by 43 per cent and fair by

36.7 per cent. Only 6 per cent of the reporting companies regard the outlook as poor. In 1927, 92 per cent reported a favorable outlook. Better business than last fall is reported by 50.7 per cent, with 24.1 per cent noting it unchanged, and 25.2 per cent reporting it not so good as in 1927. Last year 33 per cent reported an improvement in business, with 40 per cent reporting a falling off as compared with the year before. Depleted inventories are reported by 16.3 per cent, normal stocks by 74.2 per cent, and an oversupply of goods on hand by 9.5 per cent. Last year 11 per cent reported their inventories overstocked.

Increased employment over last fall is reported by 67.9 per cent, of whom 14.5 per cent report large increases and 53.4 small gains. Of those reporting a decrease, 3 per cent recorded a large falling off, and 29.1 per cent a small decrease. Last year 57 per cent reported large and small decreases.

Although the supply of all classes of labor appears to be normal, 13 per

Non-Ferrous Metal Markets

Copper Active With Prices Advanced, Tin Quiet But Stronger, Lead and Zinc Unchanged

Copper.—Another advance of $\frac{1}{4}$ c. per lb. has been made and the market is very strong. The increases were preceded by quite heavy sales last week and it is estimated that domestic orders totaled about 25,000 tons, with foreign sales about 20,000 tons. The domestic price for electrolytic copper was advanced on Monday, preceded by some sales on Saturday, to 15.50c., delivered in the Connecticut Valley. On Monday, all producers were quoting this price and reporting sales. On Tuesday, the official price of Copper

THE WEEK'S PRICES. CENTS PER POUND FOR EARLY DELIVERY						
	Oct. 23	Oct. 22	Oct. 20	Oct. 19	Oct. 18	Oct. 17
Lake copper, New York.....	15.62½	15.62½	15.37½	15.37½	15.37½	15.37½
Electrolytic copper, N. Y.*.....	15.25	15.25	15.00	15.00	15.00	15.00
Straits tin, spot, N. Y.	48.75	49.50	...	49.62½	48.95	48.87½
Lead, New York.....	6.50	6.50	6.50	6.50	6.50	6.50
Lead, St. Louis.....	6.32½	6.32½	6.32½	6.32½	6.32½	6.32½
Zinc, New York.....	6.60	6.60	6.60	6.60	6.60	6.60
Zinc, St. Louis.....	6.25	6.25	6.25	6.25	6.25	6.25

*Refinery quotation; delivered price $\frac{1}{4}$ c. higher.

Exporters Inc., was advanced to 15.75c., c.i.f. European ports. Producers report active demand from all sources and some sellers have willingly made sales into January. Most of the buying is for December-January shipments, with foreign consumers also purchasing October-November. Domestic consumers are virtually covered to the end of the year. Lake copper is active and higher at 15.50c. to 15.62½c., delivered.

Tin.—In the week ended Saturday, Oct. 20, sales were light at about 800 tons. Dealers took the major portion, consumers buying little. It is evident that the latter are well covered for the rest of the year. Arrivals, which have totaled 5930 tons this month, are heavy and stocks are ample both here

and in London. There is also 6610 tons afloat and there are no signs of a famine. The market here Tuesday was quiet, with spot Straits tin quoted at 48.75c., New York. London prices Tuesday were as follows: Spot standard, £222 5s.; future standard, £220 2s. 6d., and spot Straits, £222 10s. The Singapore price was £224 2s. 6d. The feature of these quotations is the fact that the premium of spot Straits over spot standard is only 5s., whereas a month ago it was £2 10s. per ton.

Lead.—This market has been quite active and strong in the last few days, with prices unchanged at 6.32½c., St. Louis, and 6.50c., New York, the latter being the contract price of the leading interest. Buying has been participated in by all the leading con-

Metals from New York Warehouse

sumers. On some days a little metal has been available at 6.30c., St. Louis.

Zinc.—Activity is not pronounced, but moderate sales are reported by producers each day. Quotations are unchanged at 6.25c., East St. Louis, or 6.60c., New York, although it is stated that on one or two occasions the metal has changed hands at 6.22½c., East St. Louis. The ore situation is virtually unchanged both as to price and output. The quotation is still \$40, Joplin, and the production last week was about 10,800 tons. Shipments were a little over 10,500 tons so that stocks were practically unchanged at about 56,800 tons.

Antimony.—Prices for Chinese metal are lower due to larger stocks in China and less demand here. Quotations on Tuesday were 10.50c. for spot and 10.25c. for futures, duty paid, New York.

Nickel.—Ingot nickel in wholesale

lots is quoted at 35c., shot nickel at 36c. and electrolytic nickel at 37c. per lb.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Oct. 23.—Shipments are steady but new sales are light. Prices for lead are higher. The old metal market is quiet in sales though shipments are in good volume.

Prices, per lb., in carload lots: Lake copper, 15.50c.; tin, 49.50c.; lead, 6.45c.; zinc, 6.35c. in less-than-carload lots; antimony, 12.25c. On old metals we quote copper wire, crucible shapes and copper clips, 10.75c.; copper bottoms, 9.75c.; red brass, 9.50c.; yellow brass, 7.25c.; lead pipe, 4.75c.; zinc, 3.50c.; pewter, No. 1, 30c.; tin foil, 36.25c.; block tin, 45.25c.; aluminum, 12c., all being dealers' prices for less-than-carload lots.

Fabricated Structural Steel

Awards of 25,500 Tons Include 6000 Tons for New York Subway—21,000 Tons in New Projects

AWARDS declined considerably from the average of recent weeks, amounting to only 25,500 tons. Included were 6000 tons for New York subway work and 4000 tons of plates for an oil company in the West. New projects, totaling 21,000 tons, included 4000 tons for railroad grade crossing work at Manayunk, Pa., 3000 tons for Cleveland Union Terminals Co. bridges and 3000 tons in buildings for a copper company at El Paso, Tex. Awards follow:

STATE OF MASSACHUSETTS, 275 tons, highway bridges, to Boston Bridge Works, Inc.

NEW YORK, 6000 tons, subway section 3, route 106, to Harris Structural Steel Co.

NEW YORK, 1200 tons, George Washington Hotel at Lexington Avenue and Twenty-third Street, to A. E. Norton, Inc.

NEW YORK, 400 tons, apartment building at Fifty-eighth Street and First Avenue, to McClintic-Marshall Co.

NEW YORK, 1100 tons, building on East Nineteenth Street for Sisters of the Sacred Heart, to Hinkle Steel Construction Co.

BROOKLYN, 400 tons, apartment building at 57 Pierpont Street, to Lehigh Structural Steel Co.

NAPANOCH, N. Y., 250 tons, staff and cell building, to Kellogg Structural Steel Co.

ROCHESTER, N. Y., 600 tons, grandstand, to Genesee Bridge Co.

PHILADELPHIA, 130 tons, foundation for electrification of Norristown branch of Philadelphia Electric Co., to Belmont Iron Works.

PHILADELPHIA, 100 tons, mill building for Cramp-Morris Co., to Belmont Iron Works.

PITTSBURGH, 630 tons, four river barges for Pittsburgh Plate Glass Co., to Midland Barge Co.

WILKES-BARRE, PA., 730 tons, building for Bell Telephone Co., to Shoemaker Bridge Co.

NEW CASTLE, PA., 400 tons, North Street bridge, to Independent Bridge Co.

VIRGINIAN RAILWAY, 400 tons, bridge, to Virginia Bridge & Iron Co.

SOUTHERN RAILWAY, 600 tons, bridge in Kentucky, to American Bridge Co.

STATE OF KENTUCKY, 1650 tons, Pope's Lick viaduct, to American Bridge Co.

SYLACAUGA, ALA., 220 tons, addition to

Avondale Mills, to Ingalls Iron Works.

SANFORD, FLA., 110 tons, fruit packing plant, to Ingalls Iron Works.

ALABASTER, MICH., 600 tons, building for United States Gypsum Co., to American Bridge Co.

DETROIT, 800 tons, building for Chrysler Corporation, to Russell Wheelan Foundry Co.

CHILLICOTHE, OHIO, 1100 tons, paper mill, to McClintic-Marshall Co.

PHILO, OHIO, 300 tons, gallery for power house, to Dauchy Iron Works, Chicago.

RACINE, WIS., 100 tons, building for Walker Mfg. Co., to Midland Structural Steel Co., Chicago.

ROCK ISLAND, ILL., 1600 tons, building for International Harvester Co., to McClintic-Marshall Co. and Gage Structural Steel Co.

BLOOMINGTON, ILL., 385 tons, office building, to Mississippi Valley Structural Steel Co.

CHICAGO, 100 tons, building for Midland Terra Cotta Co., to Midland Structural Steel Co., local.

EAST ST. LOUIS, ILL., 100 tons, Parks Airport, to St. Louis Structural Steel Co.

KANSAS CITY, MO., 4000 tons of plates, tanks for Roxana Petroleum Corporation, to United Iron Works.

HOOD RIVER, ORE., 1200 tons plates, pipe line, to Steel Tank & Pipe Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

NEW YORK, 800 tons, public schools 92 and 96.

ORANGEBURG, N. Y., 1000 tons, Rockland State Hospital buildings.

EASTON, PA., 500 tons, building for Lafayette College.

PHILADELPHIA, 2700 tons, building for Atwater-Kent Mfg. Co.

PHILADELPHIA, 500 tons, General Hospital at Thirty-fourth and Pine Streets.

NORRISTOWN, PA., 500 tons, addition to Montgomery County Court House.

MEDIA, PA., unnamed tonnage, Delaware County Court House.

DOVER, N. J., 700 tons, buildings at Picatinny Arsenal.

READING RAILROAD, 4000 tons, grade crossing eliminations at Manayunk, Pa.; call for bids not yet issued.

CLEVELAND, 3000 tons, catenary bridges for Cleveland Union Terminals Co.

CLEVELAND, 500 tons, bridge for Nickel Plate Railroad.

ELMHURST, ILL., 190 tons, school; Midland Structural Steel Co., Chicago, low bidder.

DULUTH, MINN., 2000 tons, lift bridge; American Bridge Co., low bidder.

EL PASO, TEX., 3000 tons, buildings for Nichols Copper Co.

KANSAS CITY, MO., 450 tons, Kline Building.

PARADISE, MONT., 600 tons, highway bridge across Columbia River.

SACRAMENTO, CAL., 206 tons, highway work in San Diego County; bids Nov. 7.

LOS ANGELES, 120 tons, hospital on Glendale Boulevard; bids being taken.

LOS ANGELES, 250 tons, apartment building on South Wilton Place; bids being taken.

Scrap Institute Discusses Classifications

Modification of the present specifications on scrap for freight rate purposes was discussed at a meeting of the classification committee of the Institute of Scrap Iron and Steel in New York, Oct. 18. It was suggested that such a modification would permit shipments of material under a scrap classification, even when it is not intended for remelting. Certain tests to be applied to the classification of scrap were proposed by Murray N. Billings of the Illinois Steel Co.

Alloy steel scrap specifications were considered at a meeting of the specifications committee of the institute on Oct. 17. The committee agreed to study the uniform specifications drawn by the United States Department of Commerce and discuss them at the next meeting of the committee to be held in Philadelphia.

Sheet & Tube to Add New Bar Capacity

The Youngstown Sheet & Tube Co. will install a 10-in. bar mill and a 14-18-in. bar mill with a monthly capacity of 30,000 tons, at its Indiana Harbor works, and will make additions to the open-hearth furnace capacity at that works sufficient to supply the extra requirements of these new mills. The latter are to be of the Morgan continuous type. Expansion of the open-hearth furnace department is to include an increase in the soaking pit capacity. Work is to be started immediately on these changes.

The National Enameling & Stamping Co., Inc., has moved its offices at Milwaukee to 12 Twelfth Street, that city.

PERSONAL

L. N. HOPKINS, since 1905 purchasing agent for the Chicago, Burlington & Quincy Railroad Co. and associated with the company for 43 years, retired on Sept. 1. He has been succeeded by JOSEPH R. HAYNES, who has been assistant purchasing agent for 23 years.

JOHN MCARTLE, recently identified with the Chrysler Corporation, Detroit, has been elected vice-president and general manager and a director of the Jordan Motor Car Co., Cleveland. E. S. JORDAN has been reelected president of the company, and A. F. ENGLAND, secretary, treasurer and a director.

SAMUEL P. GILBERT has resigned as purchasing agent for the Sharon, Pa., plant of the Westinghouse Electric & Mfg. Co. to become president of the Rogers Paper Mfg. Co., South Manchester, Conn.

RALPH K. FORD, formerly of the Ford Coal & Coke Co., is now identified with the Buffalo office of Rogers Brown & Crocker Brothers, Inc.

JOHN WANAMAKER has been appointed purchasing agent for the Apollo Steel Co., Apollo, Pa., succeeding GEORGE T. MCCARTHY.

CHARLES RANDOLPH, who has been buyer for the forge plant of the Chevrolet Motor Car Co., Detroit, has resigned to enter business on his own account as a distributor of pneumatic lathe grinders and supplies.

J. NEWTON SMITH, for a number of years vice-president and treasurer of the Boston Woven Hose & Rubber Co., Boston, has been elected president of that company, succeeding the late GEORGE E. HALL. He will also continue as treasurer. ARTHUR C. KINGSTON, director of sales, has been elected a vice-president.

BOYD B. JACK, formerly vice-president and general manager of the Empire Steel Co., Cleveland, has been appointed assistant to the president of the West Penn Steel Co., Brackenridge, Pa.

WALTER F. MUNNIKHUYSEN has been appointed district engineer for the Koppers Construction Co., Pittsburgh, with offices at 823 Peoples Gas Building, Chicago.

H. PARKER, purchasing agent for the Rome Wire Co., Rome, N. Y., has been placed in charge of that company's new plant at Mobile, Ala. He has been succeeded at Rome by STANLEY O. WILLIAMS.

LOUIS A. HAWTHORNE has been appointed development engineer for the

Atlas Fence Co., 25 Verona Avenue, Newark, N. J. He was formerly associated with the Carnegie Steel Co. and with the General Electric Co. in a similar capacity and has had wide experience in the fence industry.

S. W. PERRY, formerly representative of the DeVilbiss Co., Toledo, Ohio, with headquarters at Monmouth, Ill., has joined the sales organization of the Alexander Milburn Co., Baltimore, and will represent the company in its Middle Western territory.

M. C. RHODES, recently in the engineering department of the Riley Stoker Corporation, Worcester, Mass., has been appointed manager of the mechanical department of the Standard Power Equipment Corporation, St. Louis.

F. C. BIGGERT has relinquished the presidency of the United Engineering & Foundry Co., Pittsburgh, and George T. Ladd, vice-chairman Com-

F. C. BIGGERT

bustion Engineering Corporation, has been elected to succeed him. Mr. Biggert had expressed a desire to be relieved of the business management of the company, as he believed that his value to it would be materially increased if his entire time could be devoted to matters of engineering and research. He remains with the company as vice-president and senior engineer. Mr. Ladd, following early association with the rolling mill and roll business, founded, and for many years headed, the George T. Ladd Boiler Co., acquired by the International Combustion Engineering Corporation a few years ago. Mr. Ladd, in going with this organization, became president of the Ladd Water Tube Boiler Co. and the Heine Boiler Co., another subsidiary of the International Corporation.

LESLIE WHEELER, treasurer Pickands, Brown & Co., Chicago, has returned from a four months' visit in Europe.

S. C. BLOOM and CHARLES F. KAMRATH have established a consulting and architectural engineering business with offices in the Monadnock Block, 330 South Dearborn Street, Chicago.

D. A. CRAWFORD, president Pullman Car & Mfg. Corporation, Chicago, has been elected executive vice-president of the Pullman Co.

F. B. COYLE, metallurgist International Nickel Co., New York, addressed a joint dinner meeting of the Quad-City Foundrymen's Association and the American Society for Steel Treating at the LeClaire Hotel, Moline, Ill., on Oct. 15.

A. W. VAN BUREN, formerly Chicago sales manager for the Consolidated Machine Tool Corporation of America, has joined the sales organization of the E. L. Essley Machinery Co., 551 West Washington Boulevard, Chicago.

HANS P. DAHLSTRAND, chief engineer steam turbine department, Allis-Chalmers Mfg. Co., has been elected president of the Engineers' Society of Milwaukee. WILLIAM E. CRAWFORD, electrical engineer A. O. Smith Corporation, has been named vice-president; H. W. ROHDE, secretary, and WALTER R. MUELLER, treasurer. New directors include JOSEPH B. ARMITAGE, chief mechanical engineer Kearney & Trecker Corporation, and C. T. EVANS, electrical engineer Cutler-Hammer Mfg. Co.

DR. W. H. HATFIELD, Sheffield, England, addressed the Washington chapter of the American Society for Steel Treating on Oct. 3. His remarks were related largely to the Campbell Memorial lecture which he delivered before the American Society for Steel Treating at the annual convention in Philadelphia.

A. SERTON of The Hague, Netherlands, is now in the United States seeking a connection to sell in Europe steel specialties of American manufacture, such as alloy steels. For some years he formerly had residence in this country and represented in Europe the one-time Consolidated Steel Corporation. His temporary quarters are at 508 West 112th Street, New York.

GEORGE E. BALDWIN, formerly New York special sales representative Poldi Steel Corporation, has been appointed district sales manager for Braeburn Alloy Steel Corporation, Braeburn, Pa., in the metropolitan district of New York, including the State of Connecticut, with office at 55 West Forty-second Street, New York.

VERNON W. WELLS, Carborundum Co., Niagara Falls, N. Y., was the

principal speaker at October meeting of the Fort Wayne chapter of the American Society for Steel Treating. He talked on the manufacture of grinding wheels and on carborundum for furnace linings and other purposes. NORMAN L. DENBLE, Central Alloy Steel Corporation, Massillon, Ohio, will speak at a meeting of the chapter Nov. 21.

P. J. GORDON, for many years superintendent at Youngstown for the Republic Iron & Steel Co., has been appointed assistant to W. M. NECKERMAN, general manager.

Obituary

ERNEST L. DILDINE, founder of the Dildine Bridge & Iron Works Co., Hannibal, Mo., died Oct. 16. He was born at Summerville, South Norwich, Canada, in 1858 and for 20 years was in business at Cameron, Mo. He established the Dildine company at Hannibal 17 years ago.

FRED M. PRESCOTT, president Prescott Co., Menominee, Mich., manufacturer of oil pumps, saw mill machinery, etc., died Oct. 17, after a brief illness. He was 67 years of age. He was born in Denver, Colo., and was graduated from Cornell University in 1885. After conducting a hardware and mining supply business at Ironwood, Mich., he went to Milwaukee in 1904 and founded the Fred M. Prescott Steam Pump Co. Upon the purchase of the business by the International Steam Pump Co. in 1912, Mr. Prescott moved to Menominee to take charge of the Prescott Co., founded in 1867 by his father, the late D. Clinton Prescott, and expanded its saw mill machinery business to embrace electrically and steam driven pumping units. Two sons, Curry and Fred, Jr., are associated with the enterprise. Mr. Prescott was a member of the board of control of the Michigan College of Mines and Technology, Houghton, of the Lake Superior Mining Institute, the Engineers Club of New York, and the Hydraulic Club of New York.

LEON FALK, a director of the Weirton Steel Co. and the Edgewater Steel Co. and vice-president of the Federated Metals Co., died at Rochester, Minn., Oct. 20. He was born in Pittsburgh 58 years ago, and had spent the greater part of his life in that city. He was one of the founders of the Duquesne Reduction Co. and the Crown Chemical Co., now subsidiaries of the Federated Metals Co.

FRANK GIFFORD DREW, chairman of the board of the Winchester Repeating Arms Co., New Haven, Conn., died on Oct. 19, following an automobile accident at Pine Beach, N. J., which occurred as he was returning from the convention of the National

Hardware Association at Atlantic City. He was born at Philadelphia in 1872 and became associated with the Winchester organization in 1903. He served in the sales department for a number of years and in 1916 became head of that department. He was elected president in 1924 and two months ago, wishing to be relieved of

the more strenuous executive duties of the company, he was made chairman of the board. He was also vice-president of the Winchester-Simmons Co. and of the Simmons Hardware Co. During the war he was a member of the advisory board of the Bridgeport Ordnance District, United States War Department.

Steel Industry Presents Good Record

Chairman Taylor of Steel Corporation's Finance Committee Addresses Conference on Industries

ECONOMIC improvement in production of iron and steel came in for attention by Myron C. Taylor, chairman of the finance committee United States Steel Corporation, in an address Oct. 24 at a Conference of Major Industries at Columbia University, New York. His paper covered the progress of the industry in America and its position in the world today, the investment and profit return and a word in general on the future.

Speaking of the efforts to reduce costs, he gave the following general averages based on total tonnage and total employees of a sufficient number of plants to make them typical of the industry:

Annual Output of Finished Steel Products per Employee Engaged in the Manufacture of Iron and Steel

In 1902.....	65.45 tons
1927.....	80.91 tons
Increase	15.46 tons
Per cent of increase..	23.62%

"While this increased productivity of labor," said he, "can be attributed principally to installation of labor-saving machinery, equipment and facilities, substitution of larger and modern type units of production for many small and obsolete plants abandoned, and to improvements in operating methods, it also is due in considerable part to the progressive attitude of American workmen, who more and more have realized the vital relationship existing between volume and quality of production and higher wages.

"Present average earnings of iron and steel workers in the United States, according to a recent report published by the National Industrial Conference Board, is 12 per cent higher than the average hourly rate paid by all of the industries covered in the report mentioned, and is more than 50 per cent higher than the average labor rate paid by a number of the industries included."

Early in the address Mr. Taylor massed some figures to visualize the magnitude of the business in all its branches and ramifications. "One might say that to produce and convert each year into its multitude of finished forms our 1926 output of 48,000,000 tons of raw or ingot and casting steel requires the handling of about 200,000,000 tons of raw materials and the employment of 1,000,000 workers, receiving upward of \$1,400,000,000," he said. "The total value of

the manufactured products of the industry safely may be stated to be at least \$3,000,000,000, while the business turnover represented by sales of products moving through their several stages to the ultimate consumer reaches the large total of about \$7,000,000,000."

Profit Return Steadily Downward

In the matter of profit returns, he said in part: "From published reports of the leading corporations in the trade, it has been estimated that the capital put into the industry as original investment plus net profits retained, is upward of \$4,750,000,000, and that if valuations of tangible properties owned and used be rated at current-day cost of reproduction, less accrued deterioration on that basis, the total would be at least \$6,000,000,000.

"If profit return were to be calculated with reference to present values based on reproduction and reacquirement cost, the return would be probably somewhere around 4 per cent. The trend of profit return on investment for the past quarter century, eliminating the war period, has been steadily downward. In the case of the leading interest in the industry the annual average for the five years 1902 to 1906 was 6.67 per cent."

Fabricated Structural Steel Orders Continue Heavy

WASHINGTON, Oct. 23.—Orders for fabricated structural steel reported to the Department of Commerce in September totaled 243,942 tons, or 84 per cent of the monthly capacity of 292,015 tons of the 201 reporting firms. They compare with 285,508 tons, or 95 per cent of a capacity of 301,070 tons of 214 reporting firms in August, a record month. Computed bookings in September were 315,000 tons, against 356,250 tons in August, while computed shipments were 277,500 tons and 296,250 tons respectively, being 74 and 79 per cent of capacity.

For the nine months ended with September computed bookings were 2,553,750 tons, compared with 2,276,000 tons for the corresponding period of last year. Computed shipments have been below bookings: 2,283,750 tons in nine months this year and 2,156,250 tons last year.

Machinery Markets and News of the Works

Prospects Continue Good

Machine Tool Buying Expected to Hold Up to
End of Year at Least

MACHINE tool orders in the past week have lagged slightly behind the average of preceding weeks, but the amount of buying still in prospect leaves little doubt that business over the remainder of the year will continue at a fairly high rate. Some reports are that the total of October orders may equal that of September.

One of the large orders was for 42 special welding machines, totaling about \$300,000, placed by a Western company with the Niles-Bement-Pond Co.

The automobile industry continues one of the largest buyers. The Rolls Royce Co. of America, Springfield, Mass., is inquiring for about 30 machines. The aviation industry has become a more promising source of business. The E. W. Bliss Co., Brooklyn, has bought some machines and will

require, in all, about 50 for production of the Bliss Jupiter airplane engine.

Machine tool companies are bidding on the large list of the Norfolk & Western Railroad. The Chicago, Milwaukee, St. Paul & Pacific is about to place orders against a recent list. The New York Central has placed a few miscellaneous orders.

R. Hoe & Co., New York, printing press manufacturers, will soon place orders for six planers and prices have been asked for on about 20 lathes.

Some machine tool plants have sufficient orders to maintain current production schedules to the end of the year. Deliveries on a few types of tools range from eight to 10 weeks, although on the general run of equipment the range is nearer four to six weeks.

New York

NEW YORK, Oct. 23.—Orders for machine tools so far this month indicate that the total may be less than that of September. While some sellers report a slight falling off in business, others see no marked change. Business in prospect is large. The E. W. Bliss Co., Brooklyn, is buying equipment for the manufacture of Bliss Jupiter airplane engines, and its total requirements are said to be about 50 tools. The Rolls Royce Co. of America, Springfield, Mass., is getting prices on about 30 tools. R. Hoe & Co., New York, printing press manufacturers, will soon place orders for six planers and are getting bids on about 20 lathes. The New York Central placed a number of orders in the week, and the General Electric Co., Schenectady, was also a buyer. The Niles-Bement-Pond Co. booked an order for 42 special welding machines, totaling about \$300,000, from a Western company.

Other orders reported by Niles-Bement-Pond Co. are: One 36 in. x 14 ft. Time-Saver lathe, two No. 108 Ransom grinders, Cincinnati high-speed tapping ma-

chine, Cincinnati high-speed bench tapping machine, Aurora 20-in. drill, two Brown & Sharpe universal grinders, Niles-Acme 24-in. heavy-duty shaper, three Ransom 12-in. grinders, Acme 2-in. bolt cutter and Long & Alstatter I-beam punch. Pratt & Whitney division sold three No. 1 deep-hole drilling machines, five jig borers, 20 x 120-in. lathe, universal die sinker, 4½ x 12-in. thread miller.

Gotham Can Co., 225 Broadway, New York, is having plans drawn for a three-story plant at Brooklyn, to cost about \$40,000 with equipment. James McKillop, 821 Manhattan Avenue, Brooklyn, is architect.

Utah Copper Co., 25 Broad Street, New York, has plans for a new copper leaching plant near Bingham, Utah, to cost more than \$250,000 with equipment.

Procurement District, Signal Corps, Brooklyn, will receive bids until Nov. 6 for 3500 batteries, 2500 terminal wing-nuts, 2500 half-hinges, 25,000 machine screws, and other electrical equipment, circular 28.

Nash Queens Motor Corporation, 9430 Merrick Boulevard, Jamaica, L. I., will soon take bids for a three-story service, repair and garage building, to cost about \$230,000 with equipment. Brutus Gund-

lach, 110 East Forty-second Street, New York, is architect.

DeYoung & Moscovitz, 11 East Forty-fourth Street, New York, architects, have plans for a two-story addition to automobile service, repair and garage building, 100 x 125 ft., including improvements in present building, to cost about \$115,000 with equipment.

Fairchild Aviation Corporation, 270 West Thirty-eighth Street, New York, has arranged for increase in capital of Fairchild Aviation, Ltd., a Canadian subsidiary, to more than \$500,000, and plans early construction of new plant near Lac a la Tortue, Que., to manufacture airplanes and seaplanes, including parts production and assembling, for small aircraft and multi-motored transports. Initial works are reported to cost more than \$250,000. Company has recently discontinued working agreement with Vickers, Ltd., Montreal, for manufacture of Fairchild airplanes in Canada. Sherman M. Fairchild is president.

Ovens, power equipment, conveying and other machinery will be installed in three-story addition to plant of Pioneer Baking Co., 120 Getty Avenue, Paterson, N. J., to cost \$100,000. A. W. Lang, 1904 Madison Avenue, is architect.

Jersey Central Power & Light Co., 20 South Street, Asbury Park, N. J., is said to be planning construction of new steam-operated electric power plant at South Amboy, N. J., to cost more than \$450,000 with equipment.

New Jersey Bell Telephone Co., 1050 Broad Street, Newark, has plans for a two-story automobile service, repair and garage building for company motor trucks and cars, to cost about \$130,000 with equipment. Voorhees, Gmelin & Walker, 101 Park Avenue, New York, are architects.

Board of Education, Oradell, N. J., is said to be planning installation of manual training equipment in new three-story junior high school, for which superstructure will soon begin, to cost \$385,000. Coffin & Coffin, 522 Fifth Avenue, New York, are architects.

C. Mundt & Sons, 53 Fairmount Avenue, Jersey City, N. J., manufacturers of perforated metals, have awarded general contract to Peter Redfern & Sons Co., 569 Jackson Avenue, for a one and one-half story machine shop. John T. Rowland, Jr., 30 Journal Square, is architect.

Northern New Jersey Oil Co., 395-407 Riverside Avenue, Newark, has acquired adjoining property for expansion in storage and distributing plant.

Board of Education, Newark, has taken title to property occupied by Newark Academy as site for new building for Fawcett School of Industrial Arts, now at 55 Academy Street, to cost more than \$200,000. Newark Academy will remove to new building on First Street.

Chromium Engineering Corporation, 246 Fifth Avenue, New York, will soon open chromium plating plant with facilities for all kinds of chromium plating. Corporation has previously been engaged only in

The Crane Market

MUCH of the present activity in overhead traveling cranes is in the Middle West. In the New York and New England districts, inquiries for single cranes continue to accumulate, but prospective buyers are slow to place business. Sellers of locomotive cranes and steam shovels report a moderate volume of

inquiry, largely from contractors. In New York, Patrick McGovern, Inc., contractor on a water tunnel from Yonkers, N. Y., to Brooklyn, is reported to have bought a large number of steam shovels from an Ohio builder. D. C. Serber, Inc., New York, contractor, is understood to have bought two 5-ton truck cranes.

Among recent purchases are: Union Carbon & Carbide Co., New York, 10-ton, 56-ft. span electric crane for Duluth, Minn., from Whiting Corporation.

New York Central Railroad, New York, 25-ton, standard gage locomotive crane, from unnamed builder.

supervision and installation of chromium plating plants for manufacturers and job shops and new plant is designed for convenience of manufacturers who do not have sufficient work to warrant operating individual plant.

Atlas Steam Pressing Iron Corporation, 282-286 South Street, Newark, N. J., has been formed to manufacture steam pressing irons. Company is in production and is in market for brass couplings and fittings and metal steam hose.

South Atlantic

BALTIMORE, Oct. 22.—American Tin Co., 70 South Franklinton Road, Baltimore, recently formed by William M. Connor and associates, is reported arranging for early operation of local plant.

Club Aluminum Co., 1238 Fullerton Avenue, Chicago, manufacturer of cooking utensils, will discontinue operations at 3500 East Biddle Street, Baltimore, and will remove to Chicago where production will be concentrated in future. Chicago plant will be enlarged with addition, totaling about 30,000 sq. ft. of floor space, to cost more than \$75,000. William A. Burnette is president.

American Oil Co., American Building, Baltimore, has revised plans for a one-story storage and distributing plant at Philadelphia, to cost about \$35,000 with equipment. T. J. O'Connell is company engineer.

Tidewater Transportation Co., care of Moses G. Nusbaum, 1208 West Armistead Bridge Road, Norfolk, Va., recently formed by Mr. Nusbaum and associates, plans new two-story motor bus service, repair and terminal at Brooke Avenue and Boush Street, to cost \$350,000 with equipment. Philip B. Moser & Co., Law Building, are architects.

Town Council, Pulaski, Va., has authorized plans for municipal airport on 60-acre tract, to include hangar, repair and reconditioning shops, oil storage and distributing building and other units.

Supply section, office of chief of engineers, Munitions Building, Washington, will receive bids until Nov. 7 for two 75-kw. motor-generator sets, a.c. and d.c., respectively, two automatic starting compensators, two substation switchboards, three transformers, and four switchboard panels, circular 2.

Fred H. Merritt, Duluth, Minn., and associates are negotiating with Chesterfield Land & Coal Co., Chesterfield, Va., for purchase of about 8000 acres of coal lands between Chesterfield and Winterpock and plan development. Project will include an electric power plant, by-products coal works, machine shop and other units.

Board of Education, Griffin, Ga., will take bids before close of month for new vocational school for colored students. William J. Chase, 140 Peachtree Street, Atlanta, Ga., is architect.

Broad River Power Co., Columbia, S. C., has begun construction of a new unit at steam-operated electric power plant at Parr Shoals to increase capacity to 72,500 kw., to cost more than \$1,000,000 with transmission lines. Company is operated by General Gas & Electric Co., 50 Pine Street, New York.

Board of Awards, Baltimore, Charles F. Goob, chief engineer, has filed plans for one and two-story storage and freight terminal at McComas Street terminal, 100 x 160 ft., including mechanical handling equipment, to cost \$950,000. J. E. Greiner Co., Lexington Building, is engineer.

Board of Commissioners, Star, N. C., T. J. Ellis, commissioner, in charge, is planning purchase of electrically-operated pumping equipment, motor-driven air compressor and accessories, for municipal water system.

Pittsburgh

PITTSBURGH, Oct. 22.—Aluminum Co. of America, Inc., Oliver Building, Pittsburgh, is arranging an expansion program at New Kensington plant to cost over \$1,000,000 with equipment.

Board of Education, Washington, Pa., plans installation of manual training equipment in new high school to cost \$850,000. E. B. Lee, Seventh and Smithfield Streets, Pittsburgh, is architect; C. L. Woolridge, Fulton Building, Pittsburgh, is consulting engineer.

Westinghouse Electric & Mfg. Co., East Pittsburgh, has acquired 12 acres on William Penn Highway, near Wilkinsburg, Pa., as site for new radio experimental station, to include steel towers, power house, mechanical shops and other structures. Dr. Frank Conrad is in charge of radio division of company.

Pillsbury Flour Mills Co., Minneapolis, Minn., is said to be planning new plant at Wellsburg, W. Va., including elevating, screening and other equipment, to cost about \$165,000.

United States Engineer Office, Huntington, W. Va., will receive bids until Oct. 30, for one electrically-operated deep well pumping unit, with accessories, and storage tank, circular 70.

Russell, Burdsall & Ward Co., Port Chester, N. Y., has awarded general contract to Austin Co., Pittsburgh, for one-story addition to plant at Coraopolis, Pa., 55 x 100 ft., to cost close to \$50,000 with equipment.

Board of Education, Scottsdale, Pa., is said to be planning installation of manual training equipment in two-story addition to high school to cost \$145,000, for which plans are being completed by W. C. Eckles Co., Lawrence Savings & Trust Building, New Castle, Pa., architect.

Adamston Flat Glass Co., Clarksburg, W. Va., manufacturer of sheet glass

products, is said to be planning an expansion program, including construction of new glass-making unit, to cost over \$600,000 with machinery. New interests recently have become identified with company.

New England

BOSTON, Oct. 22.—Board of Trustees, Massachusetts Institute of Technology, Cambridge, Mass., has awarded general contract to Chase & Gilbert, 250 Stuart Street, Boston, for a one-story engine testing laboratory, 65 x 150 ft., to cost more than \$70,000 with equipment. Coolidge & Carlson, 89 State Street, Boston, are architects.

Bristol Co., Waterbury, Conn., manufacturer of temperature recording instruments, parts, etc., has filed plans for one-story addition to plant at Platts Mills, 48 x 140 ft., to cost over \$40,000 with equipment. It is said that another unit will be built soon.

Boston Ice Co., 110 State Street, Boston, is considering rebuilding of part of plant at Sharon, Mass., destroyed by fire Oct. 13.

Moth Aircraft Corporation, Graybar Building, New York, recently organized to take over license to manufacture in United States D. H. Moth aircraft of deHavilland Aircraft Co., Ltd., London, England, is said to be concluding arrangements for lease of about one half of plant of Rauch & Lang, Inc., Willimansett, Mass., manufacturer of automobiles, and 28 acres adjoining for testing and landing field. It is planned to begin production in November for assembling of aircraft, exclusive of motors, which will be secured from deHavilland company. Initial output will be on basis of 300 planes per annum. Company has arranged for stock issue to total \$690,000, portion of fund to be used for new plant. Minton M. Warren is president.

American Fork & Hoe Co., Keith Building, Cleveland, has awarded general contract to J. M. Swan & Sons, St. Johnsbury, Vt., for one and two-story addition to St. Johnsbury plant, to cost about \$50,000 with equipment.

Abrasive Machine Tool Co., Dexter Road, East Providence, R. I., has awarded general contract to Hunes Construction Co., Central Falls, R. I., for a one-story machine shop, 60 x 150 ft., to cost about \$28,000 with equipment.

Courtland Grinding Wheel Co., Huntington Road, Chester, Mass., has awarded general contract to A. M. Cowles, 5 Crown Street, Westfield, Mass., for two-story addition to cost about \$35,000 with equipment.

Prairie Window Ventilator Co., Georgia Avenue, Providence, R. I., is arranging for installation of enameling equipment in unit recently completed to double present capacity. C. I. Bigney is general manager.

Plant and equipment of Washburn

Chair Co., Warren, Mass., will be sold at public auction on Oct. 25. Sale will include wood-working and other machinery, lumber, merchandise and real estate.

Philadelphia

PHILADELPHIA, Oct. 22.—Bids are being asked on general contract until Oct. 29 by Atwater Kent Mfg. Co., Philadelphia, for one-story addition, 515 x 900 ft., to cost over \$900,000 with machinery. Ballinger Co., Twelfth and Chestnut Streets, is architect and engineer.

Stern & Co., 712 Market Street, Philadelphia, furniture, have leased a new multi-story building to be erected at Sixth Street and Glenwood Avenue, for new storage and distributing unit, with mechanical and woodworking shop, finishing department, etc., to cost over \$600,000 with equipment. LeRoy B. Rothschild, 215 South Broad Street, is architect.

Philip S. Tyre, 114 South Fifteenth Street, Philadelphia, architect, has plans for new two-story automobile service, repair and garage building, to cost approximately \$175,000 with equipment.

Cramp-Morris Industrials, Inc., Richmond and Norris Streets, Philadelphia, manufacturer of turbine engines and other heavy machinery, has awarded general contract to Fred A. Havens Co., 845 North Nineteenth Street, for one-story pipe shop, 58 x 200 ft.

South Jersey Port District, Camden, N. J., is disposing of bond issue of \$2,000,000, proceeds to be used for construction of marine terminal on Delaware River, in cooperation with City Council, to include warehouses with mechanical handling equipment. Project will cost about \$4,000,000.

American Ice Co., City Center Building, Philadelphia, has plans for a one-story plant at Ocean City, N. J., to cost over \$50,000 with equipment. C. Leslie Weir, 41 East Forty-second Street, New York, is engineer.

Pennsylvania Tool & Mfg. Co., 6 West Gay Street, York, Pa., has awarded general contract to Carson Linbaugh, 544 West King Street, for an addition to cost about \$25,000 with equipment.

Following recent reference to proposed manufacture of aircraft engines at plant of F. Wesel Mfg. Co., Scranton, Pa., manufacturer of machinery for printing, photoengraving, etc., a company has been formed under name of General Airmotors Co., with capital of \$30,000, which will make application for State charter on Oct. 25. It is headed by Louis A. Watres, president of Scranton Chamber of Commerce, and Robert B. McClave, vice-president and general manager McClave-Brooks Co., Scranton, manufacturer of grates, castings, etc. It was erroneously stated that Wesel plant had been secured under lease for this manufacture; new company has contracted with Wesel company for production of initial units of five-cylinder, 100-hp. type. Robert S. Moore, designer of engine, will supervise manufacture. Paul W. Gardner, general manager Wesel company, is a director of new organization.

Crane Co., 1301 Locust Street, Philadelphia, with headquarters at Chicago, is completing plans for one-story factory branch and distributing plant at Norristown, Pa., to cost about \$40,000 with equipment. E. Lane Crawford, 509 Swede Street, Norristown, is architect.

McCaffrey File Co., Philadelphia, has been formed with capital of \$100,000 to take over and expand company of same

name with plant at Fifth and Berks Streets. New organization is headed by George B. and John H. Whitwell.

Keystone Aircraft Corporation, Bristol, Pa., has been merged with Loening Aeronautical Engineering Co., 420 East Thirty-first Street, New York, and will increase facilities to manufacture large planes of transport type, in addition to military aircraft.

Cleveland

CLEVELAND, Oct. 22.—While sales are holding up fairly well the market was not quite so active the past week as during the previous week or two. A slowing down in orders is reported in the Michigan territory where automobile companies have been buying considerable equipment for making new models. Business in this territory is still coming in for the most part from automobile parts manufacturers.

White Motor Co. has not yet started to buy equipment it will need for bringing out a new truck model. Its requirements will include drilling and horizontal boring machines. There is an increase in the number of new companies entering the metal-working field in Cleveland which should stimulate the local market.

Smith-Armstrong Forge, Inc., incorporated with a capital stock of \$150,000, will establish a plant at 1209 Marquette Road, Cleveland, to manufacture flat die hammered forgings. Its owners are E. A. Smith and E. Armstrong, for 14 years connected with Machinery Forging Co., Cleveland.

Goodyear Tire & Rubber Co., Akron, Ohio, will establish a tire manufacturing unit in the South to take advantage of favorable production costs and distribution economies. Location has not yet been announced.

Air-Way Electric Appliance Corporation, Toledo, Ohio, manufacturer of domestic electric equipment, is disposing of stock issue of \$6,000,000, part of fund to be used for expansion in production.

Ovens, power equipment, conveying and other machinery will be installed in new three-story plant to be erected by Miami Bread Co., 2256 Robinwood Avenue, Toledo, Ohio, to cost more than \$100,000. Mills, Rhines, Bellman & Nordhoff, Ohio Building, are architects.

Patterson Welding & Repair Co., East Liverpool, Ohio, lately formed by R. L. Cawood, head of Patterson Foundry & Machine Co., has taken over former works of last noted company on South Broadway for new plant. Operation will begin in November. Mr. Cawood will be president and John S. Scott, secretary and treasurer.

Superior Body Co., Lima, Ohio, manufacturer of automobile bodies, has awarded general contract to H. U. Tuttle, Lima, for one-story addition, 60 x 200 ft., to cost about \$32,000 with equipment.

Eaton Axle & Spring Co., East 140th Street, Cleveland, has awarded general contract to Crowell & Little Construction Co., Hanna Building, for one-story addition, 330 x 400 ft., to cost more than \$400,000 with machinery.

Alliance Aircraft Corporation, Alliance, Ohio, will build new one-story plant for parts production and assembling, 60 x 275 ft., to cost about \$50,000 with equipment.

Plant, foundry, machinery and equipment of Carroll Foundry & Machine Co.,

and Bucyrus Road Roller Co., Bucyrus, Ohio, will be sold at public auction on Oct. 30 by Industrial Plants Corporation, 25 Church Street, New York, auctioneer. Sale will include machine tools, foundry and electrical equipment.

Gulf States

BIRMINGHAM, Oct. 22.—Bids will soon be asked on revised plans by Long & Lewis Hardware Co., 2014 Second Avenue, Bessemer, Ala., for one-story storage and distributing plant, 150 x 300 ft., at Birmingham, to cost \$85,000 with equipment. H. J. Skinner, 2208 Dartmouth Avenue, Bessemer, is architect.

City Council, Austin, Tex., is said to be arranging fund of \$1,250,000 for extensions and improvements in municipal lighting plant and waterworks, with installation of additional equipment.

Missouri-Kansas-Texas Railway Co., Dallas, Tex., has awarded general contract to T. H. Johnson, Citizens' National Bank Building, Sedalia, Mo., for new terminal facilities at Smithville, Tex., including engine house, machine shop, wheel shop, etc., to cost over \$150,000 with equipment.

Automatic machinery, conveying, packing and other mechanical equipment will be installed in new two-story plant, 110 x 120 ft., to be built by Houston Coca-Cola Bottling Co., 1210 Washington Street, Houston, Tex., to cost close to \$90,000 with equipment. Pringle & Smith, Norris Building, Atlanta, Ga., are architects. Alfred C. Finn, Bankers' Mortgage Building, Houston, is associate architect.

Shreveport Oil & Refining Co., Shreveport, La., recently formed of Shreveport, Jefferson, and St. Bernard oil companies, is planning new refinery and distributing plant on 10-acre tract on Mississippi River, near New Orleans, reported to cost more than \$650,000 with machinery.

Common Council, Laredo, Tex., is having plans drawn for municipal airport on 380-acre tract recently acquired, to include hangar, machine shop, reconditioning works and other units. Jack Beretta, San Antonio, Tex., is architect.

Board of Education, Brady, Tex., is said to be planning installation of manual training equipment in new high school to cost \$135,000, for which plans are being drawn by Henry T. Phelps, Hicks Building, San Antonio, Tex., architect.

Firestone Tire & Rubber Co., Akron, Ohio, is completing plans for new factory branch and distributing plant at Tampa, Fla., to cost about \$100,000 with equipment. F. J. Kennard & Son, 303 Zack Street, Tampa, are architects.

Tri-Tex Utilities Co., Gunter Building, San Antonio, Tex., has plans for natural gas pipe line in northern part of Zavalla County, and portions of La Salle and Frio Counties, totaling close to 200 miles, to cost over \$1,000,000 with compressor stations and auxiliary equipment.

Texas Co., Houston, Tex., has acquired about 100 acres near El Paso, Tex., and is reported considering new oil refinery to cost more than \$500,000.

City Council, Waco, Tex., plans installation of power equipment, pumping and other machinery for extensions in municipal waterworks, to cost about \$2,000,000. Floyd & Lockridge, Wilson Building, Dallas, Tex., are engineers.

Mississippi Power Co., Gulfport, Miss., has authorized extensions and improvements, including construction of 110,000-volt power transmission line in north-

western part of State, including substation and distributing facilities, to cost more than \$90,000.

Claude Neon Federal Co., 2038 Line Street, Shreveport, La., J. O. McFaddin, president, plans new factory to manufacture electric signs and displays.

Buffalo

BUFFALO, Oct. 22.—Augert Auto Parts Co., 652 Broadway, Buffalo, has plans for a new two-story plant unit to cost about \$25,000. L. P. Hoffman, 52 Rose Street, is architect.

Rochester Central Power Co., Rochester, N. Y., has acquired properties of Preston Power Corporation and Lake Ontario Power Corporation, operating at Sodus. Webster, Ontario, Williamson and vicinity, and will consolidate. Expansion will be carried out in district noted, including transmission line construction.

Bernard C. Maier, 1946 East Main Street, Rochester, and associates have organized Rochester Marine Co., with capital of \$25,000, and plan establishment of local plant to manufacture marine engines, including parts and assembling. Emmett J. Cassidy, Charlotte Station, Rochester, is interested in company.

Bendix Corporation, South Bend, Ind., manufacturer of four-wheel automobile brakes, has acquired a controlling interest in Eclipse Machine Co., Elmira, N. Y., heretofore held by General Motors Corporation, and will exercise active management in future. Acquired company specializes in production of automobile starting equipment, airplane equipment and machine parts, and operates plants at Elmira, East Orange, N. J., and Walkerville, Ont. These plants will be continued as in past, and expansion program will be arranged. Electric Auto Lite Co., Toledo, Ohio, has also acquired an interest in Eclipse organization. John W. Ferguson is president of reorganized company.

Stewart Bronze & Aluminum Foundry, Inc., Buffalo, care of Alfred R. Mock, 629 Linden Avenue, recently organized by Mr. Mock and associates, plans early operation of foundry for production of brass, bronze, aluminum and other castings.

Stewart Motor Corporation, 93 Dewey Avenue, Buffalo, manufacturer of motor trucks, has filed plans for a one-story addition to cost about \$30,000.

St. Louis

ST. LOUIS, Oct. 22.—Plans have been filed by N. O. Nelson Mfg. Co., 928 Chestnut Street, St. Louis, manufacturer of plumbing equipment and supplies, for two-story unit, 150 x 257 ft., to cost about \$250,000 with equipment. Preston J. Bradshaw, 718 Locust Street, is architect.

American Eagle Aircraft Corporation, 2330 Harrison Street, Kansas City, Mo., plans new plant at Fairfax airport, Kansas City, Kan., to manufacture airplanes, including parts production and assembling, to cost more than \$200,000 with equipment. E. E. Porterfield, Jr., is president.

Ovens, power equipment, conveying and other machinery will be installed in new baking plant, 100 x 145 ft., at Hot Springs, Ark., by Robert H. Kittelberger, 424 Ouachita Street, to cost about \$100,000, for which contract has been let to J. D. Johnson, 233 Central Avenue.

Wirt-Franklin Oil Co., Ardmore, Okla.,

is said to be planning construction of new oil refinery near Oklahoma City, Okla., to cost more than \$225,000 including machinery.

Curtis Mfg. Co., Keinlen Avenue, St. Louis, manufacturer of pneumatic machinery, including air hoists, air compressors, cranes, etc., has arranged for sale of stock in amount of \$2,220,000, a portion of fund to be used for expansion.

Robertson Aircraft Corporation, St. Louis, Frank H. Robertson, president, has plans for hangar, 100 x 120 ft., machine and mechanical shop, 70 x 120 ft., and other units at Lambert airport, Anglum, near St. Louis. McDonald-Condie, Inc., 502 North Taylor Street, is architect.

Kentucky Cement Corporation, care of Hunt Engineering Co., New York Life Building, Kansas City, Mo., engineer, recently formed with capital of \$2,500,000 by F. B. Drew, McAlester, Okla., and associates, is having plans drawn for new mill near Frankfort, Ky., to cost more than \$2,000,000 with machinery. Project will include boiler plant, machine shop and other units. Leigh Hunt of engineering company noted, is in charge of equipment purchases.

Cudahy Packing Co., 111 West Monroe Street, Chicago, is said to be planning addition to plant at Kansas City, Mo., including conveying and other mechanical handling equipment, to cost over \$150,000.

Greenlease-Moore Cadillac Co., 1201 South Main Street, Tulsa, Okla., has taken bids on general contract for four-story service, repair and sales building, 100 x 140 ft., to cost about \$130,000 with equipment. Noble B. Fleming, Commercial Building, is architect.

Chicago

CHICAGO, Oct. 22.—Reports vary as to the condition of the machine tool market. It is generally agreed however, that inquiry is well sustained, but analysis of new sales gives rise to speculation as to how October will compare with recent months. Much incomplete business is before the trade and the bulk of current sales comes from diversified sources.

International Harvester Co. has closed on most of the list for its Rock Island plant. Tractor manufacturers continue to buy miscellaneous items and it is reported that several large lists may develop from this source. Nash Motors Co. is figuring on further equipment for its Milwaukee plant. Studebaker Corporation, South Bend, Ind., has closed for several tools and a forging plant in Chicago has ordered three large machine tools. A 16-in. shaper has been purchased by a local screw machine parts manufacturer. The railroads are quiet except for action now being taken on Chicago, Milwaukee, St. Paul & Pacific list.

Aetna Ball Bearing Mfg. Co., 737 High Street, Chicago, has purchased 80,000 sq. ft. of property, improved with one-story brick building.

Dallas Brass & Copper Co., 820 New Orleans Street, Chicago, has purchased property in West Grand Avenue district, adjoining present plant, served by Chicago, Milwaukee, St. Paul & Pacific Railway.

American Ironing Machine Co., Algonquin, Ill., has been reorganized with E. C. Peter, president; M. J. Broderick, vice-president and general superintendent; W.

T. Peter, treasurer, and B. C. Getzelman, secretary.

Caspers Tin Plate Co., 1438 West Thirty-seventh Street, Chicago, has awarded general contract to Poirot Construction Co., 38 South Dearborn Street, for one-story unit to cost about \$100,000 with equipment. A. Epstein, 2001 West Pershing Road, is architect and engineer.

Carleton Screw Products Co., 121 Twenty-seventh Avenue, S. E., Minneapolis, Minn., has leased a one-story building, 40 x 150 ft., to be built at Hiawatha Avenue and Twenty-fourth Street, for new plant.

Board of Education, Main Township, Park Ridge, Ill., contemplates installation of manual training equipment in three-story high school between Park Ridge and Des Plaines to cost about \$500,000, for which bids will soon be asked on general contract. Zook & McCaughey, 222 West Adams Street, Chicago, and J. D. Chubb, 109 North Dearborn Street, are associated architects.

Banner Brass Foundry, 1807 Washington Street, Cedar Falls, Iowa, C. W. Olsen, head, is considering new one-story foundry, 40 x 100 ft., to cost about \$24,000 with equipment.

City Council, Durango, Colo., plans installation of power equipment, pumping and other machinery for extensions and improvements in municipal waterworks, to cost \$350,000. A. L. Kroeger is city engineer.

Chrysler-Illinois Co., 3900 South Michigan Avenue, Chicago, representative for Chrysler automobile, is considering new one-story storage, service and repair building, to cost about \$100,000.

Altorf Brothers Co., East Peoria, Ill., manufacturer of washing machines, will soon begin erection of an addition, 100 x 600 ft., which will increase its floor space nearly 30 per cent.

Rockford Die & Tool Co., 727 Seventh Street, Rockford, Ill., has construction under way on a new factory to cost \$10,000.

Cincinnati

CINCINNATI, Oct. 22.—Machine tool bookings continue to parallel those of September and indications are that unless there is an unexpected slump in orders the coming week, October will take a place beside the two previous months from the standpoint of sales. A good portion of the tools purchased in the past two weeks have come from diversified sources. However, the automobile industry has been by far the biggest buyer and upon sustained demand from that field depends, to a large extent, machine tool activities in the closing month of the year and early part of 1929.

Many local plants have sufficient unfilled orders to maintain current production schedules almost through the remainder of 1928. Deliveries on some types of tools cannot be made in less than eight to 10 weeks, although on the general run of equipment four to six weeks is nearer the average. Automobile makers in the Chicago district as well as in Detroit territory have bought new equipment. A Milwaukee company is expected to place an order for the manufacture of about 20 special machines.

In the railroad field local builders are bidding on the Norfolk & Western list, on four engine lathes for the Southern Pacific and two lathes for the Burlington. Several Cincinnati machine tool makers

report a fair volume of business from European countries in the last two months. While these sales in the aggregate constitute only a small part of total bookings, they are of large enough proportions to show that foreign users, especially those operating automobile factories, are interested in American high-production tools.

Ohio Valley Oxygen Co., 942 Kenyon Avenue, Cincinnati, has asked bids for a one-story addition, to cost \$35,000 with equipment. J. G. Steinkamp & Brother, Mercantile Library Building, are architects. F. R. Williamson is president.

G. R. Boeckling Motor Car Co., 1900 East Third Street, Dayton, Ohio, will take bids in November for new two-story service, repair and garage building, to cost approximately \$100,000 with equipment. Gebhardt & Schaeffer, Miami Savings & Trust Building, are architects.

Weinman Pump Mfg. Co., 276 Spruce Street, Columbus, Ohio, has awarded general contract to Middle States Construction Co., 1183 Essex Avenue, for a two-story building to cost about \$22,000.

Memphis Natural Gas Co., Memphis, Tenn., is disposing of bond issue of \$6,000,000, part of proceeds to be used for expansion, including construction of pipe line, 210 miles long, compressor stations and auxiliary work.

Air Corps, Material Division, Wright Field, Dayton, Ohio, will receive bids until Oct. 29 for tire pressure gages, vulcanizing knives, wrenches, and other tools, circular 153; until Nov. 5 for 1000 tow target assemblies, circular 160.

Board of Education, Covington, Ohio, is said to be considering installation of manual training equipment in new senior and junior high school to cost \$160,000. Marley Leyley, Tecumseh Building, Springfield, Ohio, is architect.

Milwaukee

MILWAUKEE, Oct. 22.—Machine-tool business continues in good volume. Only a shortage of skilled machinists and other shop labor is restricting further expansion of production and, in some instances, delay in getting deliveries of new equipment. Demand is broad and diversified, with the automotive industries in general the most active buyers.

Aluminum Goods Mfg. Co., Manitowoc, Wis., has started work on a seven-story addition, 115 x 302 ft., to main plant in Manitowoc. It will be used both for manufacturing and warehousing and will cost about \$600,000 complete. Plans are by W. Fred Dolke, Jr., architect, 9 South Clinton Street, Chicago.

Wisconsin Tool & Mfg. Co., 1219 Thirtieth Street, Milwaukee, specializing in production of heavy dies for automotive industry, is preparing to move into its new plant at Forty-fourth and State Streets, representing an investment of \$150,000 and affording 60,000 sq. ft., six times former area.

Waukesha Motor Co., Waukesha, Wis., has broken ground for second unit of a \$600,000 enlargement program. It will be two stories, 44 x 264 ft., and used as a shipping and storage building. A 3-ton crane has been purchased from Harnisfeger Corporation. A. W. Dietzel is plant engineer.

Plans are being completed by W. G. Kirchhoffer, consulting engineer, Madison, Wis., for a water softener plant for University of Wisconsin, Madison. Equipment will include two 2,000,000-gal.

pumping units, one steam turbine, several motors, chemical feeder, power mixer, etc. Bids for building and equipment will be taken shortly by J. D. Phillips, business manager, Board of Regents, Madison.

Wisconsin Power & Light Co., Madison, Wis., has placed contract with S. Morgan Smith, 33 South Clark Street, Chicago, for two waterwheels for a \$150,000 hydro-electric generating plant improvement of its subsidiary, Rockton Light & Power Co., Rockton, Ill. Generators and other equipment remain to be purchased. Mead & Seastone, Madison, are consulting engineers, and E. J. Kallevang is chief engineer.

Wisconsin Radiator & Body Co., 570 National Avenue, is starting work on an addition to cost \$25,000 complete. Meredith Brothers Co., 253 Washington Street, local, is general contractor.

Nash Motors Co., Kenosha, Wis., has let complete contract to Worden-Allen Co., Chicago, for a new forge shop and heat treating plant, 160 x 190 ft., at Racine. In connection with power plant improvements for this division, Charles A. Cahill & Sons, 214 Mason Street, Milwaukee, consulting engineers, are taking bids on two 150-ft. steel stacks, 78 in. diameter. David M. Averill is general manager at Racine.

Sivyer Steel Casting Co., Milwaukee, is completing work on a one-story foundry addition, 48 x 52 ft., and a new power house, 70 ft. sq., at West Milwaukee.

Detroit

DETROIT, Oct. 22.—Campbell, Wyant & Cannon Foundry Co., Muskegon Heights, Mich., manufacturer of iron castings, is planning expansion program to cost more than \$500,000, to include new foundry units and additional equipment.

Heywood Starter Co., 6547 St. Paul Street, Detroit, manufacturer of starting equipment for aircraft motors, is disposing of a stock issue to total \$187,500, the majority of proceeds to be used for expansion. Edward Hughes is general manager.

Chrysler Corporation, Detroit, is having plans drawn for one-story addition to plant on East Jefferson Avenue, for enameling to cost over \$85,000; also for a five-story addition to same plant for general service to cost more than \$130,000. Smith, Hinchman & Grylls, Marquette Building, are architects. For its Dodge Brothers Division, company plans one-story assembling unit, 120 x 1900 ft., to cost more than \$750,000 with equipment.

Edward Sterner Co., Flint, Mich., plumbing equipment and supplies, is said to be planning to rebuild portion of storage, distributing, pipe fitting and mechanical plant recently destroyed by fire.

Board of Education, Pontiac, Mich., plans installation of manual training equipment in new Washington junior high school to cost \$475,000, for which bids have been asked on general contract. Malcolmson & Higginbotham, 1219 Griswold Street, Detroit, are architects.

National Stamping Co., 617 Glover Avenue, Detroit, has awarded general contract to W. J. C. Kaufmann, 10610 Shoemaker Street, for one-story addition for enameling, to cost more than \$40,000.

Lincoln Mfg. Co., 2630 Erskine Street, Detroit, manufacturer of electrical equipment and supplies, has awarded general contract to Lerner-Sobel Co., Book Build-

ing, for four-story plant, 86 x 100 ft., to cost about \$100,000 with equipment.

McManus Steel & Iron Co., Detroit, recently formed with capital of \$500,000, will take over and succeed to plant and business of Ruhl Malleable Co., 3290 Wight Street. New company is disposing of 50,000 shares of common stock to provide funds for purchase and expansion. Patrick J. McManus, formerly connected with Buhl company, is president and general manager of the new organization.

Muskegon Piston Ring Co., Sixth and Alpha Streets, Muskegon, Mich., will soon take bids for one-story addition, to cost more than \$25,000 with equipment. Frank Forster, Lyman Block, is architect.

Holcroft & Co., 6545 Epworth Boulevard, Detroit, manufacturers of furnaces, ovens, etc., have plans for one and two-story addition, 105 x 180 ft., to cost more than \$100,000 with equipment. C. L. Phelps, Detroit Savings Bank Building, is architect.

Standard Self-Lock-Nut Co., Muskegon, Mich., has been formed to manufacture self-lock nut depending on frictional contraction for holding and gripping power. Andrew Wierengo, president Standard Malleable Iron Co., Muskegon, is president of new company. Plant is at Muskegon and company will manufacture product from malleable iron made by Standard company.

Allied Products Corporation, Detroit, has succeeded to business and properties of Victor-Peninsular Co., Detroit; Richard Brothers Die Works, Detroit and Hillsdale, Mich., and Indiana Lamp Corporation, Connersville, Ind. General offices of new concern will be at 4646 Lawton Avenue, at plant of Victor-Peninsular Co. R. O. Cunningham, formerly president Indiana Lamp Corporation, is president of new company, and former executives of various units will remain in charge of their respective plants.

Wise & Braisted, General Motors Building, Detroit, have been appointed district sales agents in Michigan for Roller-Smith Co., 233 Broadway, New York.

C. H. C. Co., 417½ Liberty Street, Jackson, Mich., has been formed to manufacture screw machine products and tools. Company is in operation and is in market for screw stock and tool steel. Work will be done by contract.

Harris-Beasley, Inc., 1304 Harper Avenue, Detroit, has been organized to do electroplating, specializing in chromium plating, polishing and buffing.

Indiana

INDIANAPOLIS, Oct. 22.—Contract has been let by Mid-States Steel & Wire Co., Crawfordsville, to Warner & Wirt, local, for one-story foundry, 85 x 245 ft., to cost about \$45,000 with equipment.

Chevrolet Automobile Sales, 345 North Capitol Avenue, Indianapolis, operated by Jones-Whitaker Sales Co., is having plans drawn for a two-story service, repair and sales building, to cost about \$100,000 with equipment.

Continuing its expansion program, Studebaker Corporation, South Bend, has awarded general contract to Ralph Sollitt & Sons, 518 East Sample Street, for one-story addition, 62 x 300 ft., to cost about \$80,000. Lockhart & Fett, Associates Building, are architects. Plans are also being drawn by same architects for a two-story building, 90 x 200 ft., to cost about \$50,000.

Department of Health, Indianapolis, is having plans drawn for new power house at city hospital, to cost more than \$350,000 with equipment. R. Frost Daggett, Continental Bank Building, is architect; C. R. Ammerman, same address, is consulting engineer.

City Council, Evansville, has plans for municipal airport on Princeton Highway, including hangars, machine and repair shop, oil storage and other units, to cost \$175,000. B. Russell Shaw, Arcade Building, St. Louis, is engineer.

Louisville Pipe Organ Co., 1615 North Thirteenth Street, Terre Haute, Ind., has been organized to manufacture pipe organs. Residence and mortuary organs are equipped with automatic reproducing roll attachment. Contracts for equipment have been let and plant is in operation.

Diamond Chain & Mfg. Co., Indianapolis, has completed arrangements with I. H. Dexter Co., Goshen, N. Y., to manufacture Clark flexible coupling, made and sold by Dexter company for 15 years. Couplings are made in sizes for slow or high speeds and continuous or reciprocating drives. Diamond company has awarded general contract to Hall Construction Co., Board of Trade Building, for two additions, four stories, 60 x 160 ft., and one story, 40 x 100 ft., to cost over \$125,000 with equipment. Bishop, Knowlton & Carson, 312 North Meridian Street, are architects.

Pacific Coast

SAN FRANCISCO, Oct. 18.—Santa Maria Airlines, Inc., Santa Maria, Cal., has plans for two new hangars and one-story machine shop to cost more than \$75,000.

City Council, Turlock, Cal., will receive bids until Nov. 4 for four motor-driven pumping plants, including pumping units and accessories. A. P. Ferguson is city clerk.

Great Western Power Co., 530 Bush Street, San Francisco, has asked sub-bids for all portions of work for new steam-operated electric generating plant, one story, 150 x 180 ft., to cost more than \$3,000,000 with equipment. Harold K. Fox is chief engineer; McClellan & Junkersfeld, 68 Trinity Place, New York, are consulting engineers.

Majestic Furnace & Mfg. Co., 1723 Westlake Avenue, North, Seattle, has purchased additional property and is considering new one-story unit, 95 x 290 ft., to cost about \$60,000.

Coal Carbonizers, Inc., Centralia, Wash., recently organized, has acquired plant and business of Mendota Coal & Coke Co., Mendota, B. H. Johnston, president, and is said to be planning construction of new coal carbonizing and reduction plant to cost more than \$400,000 with equipment.

Joseph Kreutzer, 1801 South Hope Street, Los Angeles, and associates have engaged Austin Co. of California, Inc., 777 East Washington Street, to prepare plans for airport near Culver City, consisting of four hangars, aircraft factory for parts and assembling, experimental building and school, two machine and repair shops and other units, to cost about \$280,000.

Southern California Edison Co., Los Angeles, has approved plans for one-story mechanical shop and testing works near Visalia, Cal., with one-story equipment storage and distributing plant, 61 x 220 ft., steel tank of 75,000-gal. capacity on 100-ft. steel tower and other structures, to cost about \$250,000.

Idaho Portland Cement Co., Pocatello, Idaho, E. J. Simons, president, is contemplating new mill at Inkom, Idaho, to cost more than \$600,000 with machinery.

Union Oil Co., Grant and Kentucky Streets, Bellingham, Wash., will soon begin construction of oil storage and distributing plant to cost \$125,000 with equipment.

Canada

TORONTO, Oct. 22.—Machine tool business continues in good volume and inquiries indicate a steady demand for some time to come. Although buying is well distributed and covers many lines of manufacture, the automotive industry is the principal purchaser at the moment. The Steel Co. of Canada, Ltd., Hamilton, is expected to come into the market soon for considerable equipment for its proposed \$6,000,000 plant addition and has already placed orders for several cranes. The Algoma Steel Corporation, Sault Ste. Marie, Ont., and the Dominion Iron & Steel Co., Sydney, N. S., have been buying recently. The railroads have also taken car shop equipment and have small lists out for replacement tools.

Durant Motors of Canada, Ltd., Toronto, has purchased site with 750 ft. frontage on Laird Drive, Leaside, and will erect a plant building to cost \$75,000.

General Motors of Canada, Ltd., Oshawa, Ont., will double capacity of its stamping plant by an addition 105 x 400 ft., to cost with equipment \$80,000. Contract has been awarded to Gay Co., Oshawa. Other additions are under way.

Enamel & Heating Products, Ltd., will make extensions and alterations to its plants at Sackville and Amherst, N. S. Work will be started immediately on a one-story building at Sackville, 50 x 100 ft. At Amherst facilities for handling enameling requirements of company will be increased. Stove manufacturing will be concentrated at Sackville and building at Amherst where a few stoves are now manufactured will be turned into a wet process enameling plant. An electrically-driven compressor will be installed and arrangements are being made to start another oven.

W. H. Cooper, 6 Hughson Street North, Hamilton, Ont., has been awarded general contract for two-story addition, 60 x 120 ft., to plant of Wallace Barnes Co., Ltd., Hamilton, manufacturer of steel wire springs, etc.

Frankel Salvage Co., Ltd., Eastern Avenue, Toronto, has been awarded contract for one-story addition, 140 x 170 ft., for A. R. Williams Machinery Co., Ltd., 64 Front Street West, Toronto.

Pannill Door Co., Toronto, will establish a manufacturing plant at Frederick and Front Streets, and will require woodworking machinery and tools.

Walter G. Hunt & Co., Ltd., 1405 Bishop Street, has been awarded general contract for an addition to forge foundry for Canadian Tube & Steel Products, Ltd., 107 Hamilton Street, Ville Emard, Que., to cost \$10,000.

Wood Hydraulic Hoist & Body Co., 1025 Tecumseh Road, Windsor, Ont., has awarded contract to the Reynolds Wood Co., for a one-story addition, 80 x 85 ft., to cost \$25,000.

MacLaren Firm, Ltd., Birmingham, Que., has awarded general contract to William I. Bishop, Ltd., 10 Cathcart Street, Montreal, for a power plant, on the Lievre River, to cost \$15,000,000.

R. D. Ferguson, New York, is engineer. Work will also include erection of a 250-ton paper mill, sulphite mill, etc.

Great Lakes Power Co., Ltd., 527 Queen Street East, Sault Ste. Marie, Ont., has awarded contract to Lang & Ross, 623 Queen Street East, for a power plant in connection with its \$1,000,000 power development project near Sault Ste. Marie.

Western Canada

City Council, Nelson, B. C., has awarded contract to Stuart Cameron & Co., 543 Granville Street, Vancouver, B. C., for construction of a hydroelectric plant, including reinforced concrete power house and water storage dam, to cost approximately \$150,000. R. C. Affleck is engineer.

Clayburn Co., Ltd., 850 Hastings Street, Vancouver, B. C., will start work soon on a manufacturing plant at Kilgard near Abbotsford, B. C., to cost \$300,000.

Plant of Dominion Rubber System (Manitoba), Ltd., Princess Street, Winnipeg, was destroyed by fire Oct. 14.

Foreign

ABOUT 80 per cent of tractor plant of Ford Motor Co., Detroit, will be removed from Fordson, Mich., to Cork, Ireland, where production will be largely concentrated in future, owing to increased demand from European countries. Cork plant will be developed for larger output. It is expected to have removal completed early in coming year. Tractor production was discontinued at Fordson works several months ago and while this branch will not be permanently abandoned in United States, all space at Fordson will be given over for some time to manufacture of Ford automobiles.

Department of Public Works, State of Rio Grande do Sul, Brazil, is planning early call for bids for construction and installation of a number of hydroelectric power plants for light and power to different municipalities. It is also proposed to electrify railroad between Santa Maria and Porto Alegre, about 250 miles.

Soviet Russian Government, Leningrad, through Amtorg Trading Corporation, 165 Broadway, New York, its official buying agency, has contracted with International General Electric Co., 120 Broadway, for electrical machinery and supplies for a six-year period, in total amount from \$21,000,000 to \$26,000,000 in that time, including equipment for hydroelectric power development, power substations, transmission and distributing lines, and other operating service. During first two years purchases are to aggregate not less than \$5,000,000 nor more than \$10,000,000, and succeeding four years not less than \$4,000,000 per annum.

Port Commission, Genoa, Italy, has authorized extensions and improvements to include construction of large storage and distributing warehouse, with mechanical handling equipment, including 14 lifting cranes, estimated to cost \$212,000.

Andes Copper Mining Co., 25 Broadway, New York, operating porphyritic copper ore properties in Province of Atacama, Chile, has disposed of a block of stock, a portion of proceeds to be used in connection with development and expansion of mines, including installation of equipment. Company is a subsidiary of Anaconda Copper Mining Co.

Tagil Mills, Leningrad, Russia, have fund of \$1,000,000 for extensions and improvements in sheet iron works, to include installation of rolling machinery, manufacture of roofing and other products, to cost approximately one-half of sum noted.

THE IRON AGE

New York, November 1, 1928

ESTABLISHED 1855

VOL. 122, No. 18

Handling Parts Orders by Conveyor

Much Labor Saved by System Adopted by Packard—
One Continuous Conveyor Used

BY B. R. HORSLEY

FOR 28 years the Packard Motor Car Co. has been turning out automobiles. Ample evidence could be adduced to show that the product is a long-lived car, from a survey of the very large number of old models still in use. The company has not built a truck in over eight years and yet not a day passes without several parts orders arriving for service on Packard trucks.

A corollary to the large number of old models still in use is the necessity of a parts service department equipped to furnish promptly and economically any or all parts, materials, tools or accessories that could be required for the continued satisfactory use of any car or truck the company ever produced. Dedicated to this purpose, a modern four-story steel and concrete structure, covering an entire city block and affording 240,000 sq. ft. of floor space, has been built, to be devoted exclusively to the Service Parts Manufacturing and Merchandising Division. Operated independently of production departments, with its own executive offices occupying a portion of the second floor of the building, the service parts division is acknowledged to be

one of the most modern and best equipped parts departments in the automotive industry.

About one-third of the building is occupied by the service office, stockroom, shipping and receiving departments. The other two-thirds of the building, mostly on the upper floors, is used for manufacturing and assembling all parts not used on current production cars. The stockrooms located on the lower floors house all of the smaller parts and those parts most frequently ordered. These are stored in steel bins and on steel shelves, accessible to stockroom employees.

Distributing these parts from the receiving department to the various sections in which they are stored and moving them again, piece by piece, to the packing department to be assembled into multiple parts orders was a great and growing problem, requiring a steadily increasing number of employees. To minimize this handling cost and speed up the filling of multiple parts orders a continuous chain-type conveyor 827 ft. long was installed by the Palmer-Bee Co., Detroit.

Because the conveyor follows a devious route, making

STARTING with the company 17 years ago, B. R. Horsley has been manager of the Service Parts Merchandising Division of the Packard Motor Car Co. for the past eight years. For some years he was shunted about from one section of the department to another until he had gained a wide knowledge of the workings of all of them. Thus, when a vacancy occurred at the head of the department, Mr. Horsley was prepared to fill it. He has traveled extensively for the company, studying service methods and distribution problems in practically every automotive plant in the country, in mail-order houses and other plants confronted with similar problems. He is largely responsible for the remarkably effective ordering system and conveyor assembly plan about which he writes here. Now many of the plants he visited are sending representatives to investigate the system which Mr. Horsley has helped to evolve.

many turns, dips and rises in its course as it visits, in turn, the receiving, packing and shipping departments and every section of the parts storage department on the ground floor, it was imperative that the chain be adaptable to turning in any direction. This is accomplished by running the chain on edge, so that the regular chain joint pins permit turning in any horizontal direction, as when the chain goes around a sprocket and allows the conveyor to double back on its route in the receiving department.

At this point the heaviest loads are placed upon the trays of the conveyor, which is, therefore, only a few inches from the floor. At some points, as in the packing and checking department, where the employees work at benches, the conveyor is waist high. At other points it rises to about 7 ft. from the floor to clear aisles in which employees pass

ELEVATION (Below) of Conveyor with Tray, in the Parts Department. This shows the universal joint couplings which make possible the many turns, rises and dips along the route of the conveyor. At right is plan of conveyor without trays attached, showing tops of the vertical links in the chain, 9 in. apart, and the flanged wheels, on axles 18 in. apart. Cross-section (above) shows flanged wheels riding on steel angle tracks and angle guard rails to protect employees from the moving trays

back and forth. Transverse joints in the chain, 3 ft. apart, between adjoining trays, make possible these rising and dipping bends. The trays, of which there are 279, are 18 in. by 28 in., made of sheet steel with a 1 1/4-in. flange all around to prevent round pieces from rolling off. Propelled by a 5-hp. motor, the conveyor travels at the rate of 60 ft. a minute, completing a round trip in less than 15 min.

Along the route of the conveyor for the greater part of its length are steel stock bins and shelves especially adapted to carrying small quantities of the more active parts. Just back of these readily accessible bins and shelves, in rows running at right angles to the conveyor, are the larger bins and shelves where surplus stocks of material are carried. From these overflow stocks the smaller bins and shelves, closer to the conveyor, are replenished as their small stocks become depleted from the filling of orders.

When new shipments of parts and materials arrive in the receiving room they are carefully checked by receiving clerks and each lot is placed on a tray of the conveyor, with a large cardboard bearing a symbol letter which designates the section of the stockrooms to which it is destined. This

enables the stockroom employees to note from a distance which of the approaching trays bear parts and material for their respective sections. Each lot is taken from the conveyor by the employee detailed to the section in which it is to be stored and is placed in the larger surplus bins and shelves back of those closest to the conveyor.

This arrangement of carrying surplus stocks at some distance from the conveyor leaves the space along both sides of the conveyor available for the greatest possible assortment of parts in small quantities. These small stocks are not grouped together by models, as might be expected, nor are parts of a similar nature to be found close to each other in the racks and bins. It has been found advantageous to separate parts resembling each other in size and form. This reduces the possibility of errors on the part of the stockroom man. He will find a required part located among parts so different that his common sense will enable him to recognize the part wanted. The same advantage helps him to place incoming stocks where they belong, with little effort.

It is not required of the stockroom man that he be either a mechanic or a clerk. He does not check the order nor does he write the destination of the outgoing part. He can perform all his duties satisfactorily without a lead pencil. All clerical work has been taken away from him by the unique ordering system used in the division.

Parts orders, originating with the dealers, are first sent to Packard distributors, located in approximately 100 cities throughout the country. The very close relations between the dealers, the distributors and the factory have helped to bring about a simplified routine which aids materially in the prompt shipment of parts. All parts orders sent to the factory are issued by the distributors on forms furnished by the factory. These orders are set up in blocks of six copies to each order and are filled out completely in the distributor's office, eliminating delays and possible errors, which might result if the orders had to be copied at the factory. Two sizes of order forms are provided, one with six item lines for small orders, the other with 12 lines. Each set consists of the following copies of the form:

1. Service stores office—stock and shipping copy.
2. Factory service office reference copy.
3. Section copy.
4. Packing copy.
5. Acknowledgment copy.
6. Distributer's hold and reference copy.

In filling out an order the distributor furnishes the shipping destination of the parts, the incorporated or registered name of the person or company to whom the parts are to be charged, shipping instructions, amounts of each part required, parts numbers and names of parts. When completely filled out the first five copies are mailed to the factory. The sixth copy is retained by the distributor for reference and follow-up work. Upon receipt of the five copies at the factory they are time-stamped and checked for correctness.

A count of the items ordered is then made to allow for the scheduling of the order and to control the volume of

BILLING on the Above Actual Order Was Made on Hollerith Key Punch and Tabulating Equipment. These bills are made out from the original copy of the distributor's order after the parts are shipped. Bills show the date, distributor's code, his order number, amount shipped, part number, selling price and total selling price. The distributor's name and address appearing on this bill is the only typing done

UNIQUE Order Blank (Right) Used by Packard Motor Car Distributors in Ordering Parts and Sundries from the Factory in Detroit. Six copies are made out by the distributor and five are sent to the factory. One of these is cut into strips, one strip to each item on the order. The strips are distributed to the various sections of the department. An employee in each section locates the item called for on the strip reaching him and places it on the chain conveyor, together with the strip from the section copy of the order and a colored and numbered card indicating the section of the checking and packing department where the order is to be assembled. The upper left corner on the copy, where the distributor's name and address appear, is a perforated coupon which can be detached and used as mailing direction on parts small enough to be sent by parcel post

ONE of the 16,000 Stock Record Cards Which Are Posted Daily From the Orders Shipped to Distributors. These definitely control the number of parts, materials and tools on hand, as all cards upon which entries have been made are off-set in the trays containing them, to be scanned by the order clerks, who keep the on-hand supply of each part above an established danger limit.

SECTION

R

LETTERED Section Cards Are Used on Incoming Parts to Designate the Section to Which Each Item of a Shipment Is To Be Delivered. Above lettered card is one of the numbered, vari-colored cards placed on each loaded tray moving toward the packing and shipping departments. Attached to the card by a clip is the slit section of the order

work. The five copies still intact are then passed over location and price records, where they are checked for correctness of part number and name. At this point the factory bin location is filled in and the selling price and cost per cent are entered. The order is then scheduled for the

In other words, this copy is cut into as many different orders as there are different items on the complete order, to permit quick circulation of the orders to the various sections in which the required items are located and the simultaneous selection of all items on one complete order.

POWER Plant of the Continuous Chain Conveyor Used to Assemble Parts and Sundries in the Parts and Service Division of the Packard Motor Car Co. A 5-hp., 750 r.p.m. motor and the large bevel gear shown give the conveyor a speed of 60 ft. a minute. The conveyor is raised to make room for employees passing through the aisles, giving clearance of 6 ft. 6 in.

CHECKING and Packing Sections (Below), Where Each Part Ordered Is Lifted from the Tray, Accompanied by the Strip from the Order Blank Bearing Its Part Number, and a Colored Card or "Flag," Designating at Which Section It Is to Meet and Be Assembled. With the Other Items Clipped from the Same Order. Having the four remaining copies of the order, the inspectors remove all items for each order from the trays and check them against the complete order. After the last item has arrived, the checker pushes the completed order across the bench to the packers

stock department, stamped with a large numeral indicating the hour in which it must be filled, time-stamped and delivered to the stockroom.

Upon receipt of the order in the stockroom the No. 3 copy, or Section Copy, is detached; the other four are placed in a folder and delivered to the checkers, where they are filed according to the schedule hour. The section copy is then passed under a printer's hand shear, where it is cut into small, horizontal strips, one item line to each strip.

These slips are delivered to the various sections, each slip going to the stock man in charge of the section in which the required item is located.

After selecting the required part or the specified number of the part ordered on the slip that reaches him, the stockroom man places the slip on one of the moving trays of the conveyor with the parts wanted from his section. His only other responsibility is to place on the same tray a colored tag indicating to which checker his contribution is destined.

LONGEST Straight-Away Section of the Parts Assembling Conveyor (in Oval). This section, 207 ft. long, is devoted to very small parts such as small gears, pinions, nuts and bolts, washers, etc. Stockroom employees take off the slit sections of the order blank, select the part ordered and place both together on the conveyor a few seconds after the orders reach them. These steel bins are supplied with parts from other surplus bins, running at right angles to the aisle, on the left

RECEIVING Room (Above), Visited by the Chain Conveyor, Which Distributes to the Various Sections of the Department Shipments of Parts and Sundries Arriving by Rail and Motor Truck from Other Plants and from Other Parts of the Packard Plant. Each item placed on the tray bears a lettered card denoting the section of the department where the item is to be taken off and stored in the steel bins which line portions of the conveyor, or to the auxiliary surplus bins which run out at right angles to the conveyor at various points along its route. At this point the conveyor is closest to the floor because of the great weight of some of the items to be placed upon it here

AT This Point (Right) the Assembly Conveyor Makes a Short Excursion Into the Section of the Department Devoted to Special Tools Adapted to Packard Equipment and Supplied to Dealers, Through the Distributors, from the Factory. Here the flexibility of the conveyor is given its most severe test, as it must turn an acute angle and make a rise of 5 ft. 6 in. in a short incline to clear an aisle. Because some of the heaviest items are put on the conveyor at this point, the trays are only 14 in. from the floor

Small parts are placed in paper bags and the slip is clipped to the bag. Larger parts have the slips attached to them before they are placed on the tray.

Arrived at the checking and packing department, the parts are removed from the conveyor by the checker whose symbol card accompanies them. He checks the items against the other copies of the order that are still in his possession and assembles them with the other parts for the same order, arriving from other sections of the stockroom. Each checker handles only orders from a certain territory, with the result that orders from a given distributor are always handled by the same checker. Parts called for by several orders from the same distributor accumulate on the same section of the checkers' bench, insuring the most compact and economical packing.

As each order is completed the checker fills in on all copies of the order blank the quantity of each part that is to be shipped and makes a back-order note of any parts that may be missing for one reason or another and which are to be shipped later. The checker then passes the parts across the checkers' bench to the packers' bench. The No. 1 Shipping Copy and the No. 4 Packing Copy of the order go with the material to be shipped. The No. 2 Factory Service Office Copy and the No. 5 Acknowledgment Copy of the original order are retained temporarily by the checker, who later sends them to the Service Stores Office. The No. 2 copy is kept for stock record entries and for follow-up work on any items back-ordered. As soon as the parts are checked and ready to be packed for shipment the No. 5 Acknowledgment Copy is mailed to the distributor, to inform him which parts are being shipped and which, if any, are back-ordered, to follow in a later shipment.

When the parts are packed in the shipping case the No. 4 Packing Copy is packed inside the case with the parts and the case is then nailed up. On the outside of the case is attached the No. 1 Service Stores Office—Shipping Copy. A slat and roller gravity conveyor is used to move the packed shipping cases from the checking and packing department to the shipping department, where the shipping copy of the order is removed from the packing case and transportation papers are issued. A rubber stamp is used to indicate on each order how and when the parts were shipped. These orders are forwarded to the Service Stores Office, where the billing of the parts is done from the No. 1 Service Stores Office Copy after shipment is made. Prices on these orders are checked for accuracy in the service office, after which they are grouped with other orders from

the same distributor, so that each invoice covers as many orders and items as possible.

Hollerith key punch and tabulating equipment is used to complete the invoice. A card is punched for each item shipped, showing the date, distributor's order number, distributor's code, amount shipped, part number, selling price, total selling price and cost per cent. Placed in the tabulating machine these cards make out the invoice showing all the information that has been punched upon them. A typist then enters upon the invoice the incorporated or registered name of the person or company to whom the parts are to be charged and the name of the consignee.

Stock record cards for the control of material on hand are a very important part of the Packard parts system. A definite record, posted daily, is kept of every part carried in the service department. Record cards are filed numerically by part number and show the part name, bin location, selling and cost price, models on which the part is used, record of all orders for new material, record of all parts disbursed and balance on hand. After each entry the cards are offset in the file so they can be examined by a special order clerk for check-up purposes. At the end of each month a summarized entry of the total number sold during the month is made and a danger limit is established and entered upon the card. This danger limit is the basis of control of the amount to be carried on hand and covers an average three months' supply.

To assist in keeping these records accurate a perpetual inventory system is carried out. When the entries on the records indicate that a reconciliation should be made between the amount shown to be on hand and the actual amount in the bin a special inventory form is made out and sent to the parts department, where an inventory is taken. The form is properly filled out and returned to the office, where a check is made and, when there is any substantial discrepancy, the correct amount is filled in on the card. This system detects all possible errors and keeps the records and bins in balance.

At the end of each month a special report is compiled by models under which the parts are classified. This report shows the total selling value of all parts sold, the total cost value and the profits made by each model. Additional reports are compiled showing the value of shipments by transportation classification, value of shipments per vehicle in the field, etc. A quarterly inventory is taken and analyzed by models. This is to assist in assuring complete control of inventory and turnover.

Index of National Prosperity

An unusual index has been added to the large number with which we are familiar in the shape of a British Index of National Prosperity. This has been prepared for *Economist*, London, by G. D. Rokeling and its presentation has a foreword by Sir Josiah C. Stamp.

Briefly, an index of production combined with an index of net real income from foreign investment gives an index of real national income. This number divided by an index number of population gives an index of national income per person, which for practical purposes is the measure of national prosperity. The index of production is based on the volume of raw material worked up by industry, the number of productive workers and the consumption of coal as the principal source of heat and power. The two latter items are each given double the weight of the raw material imports. The net real income from foreign investment is based upon Board of Trade estimates, influenced by Government payments and by an index number of wholesale prices.

In putting the final index together, the index of production is given a weight of 24 times that of the income from

foreign investment. The figures obtained for a series of years, as indicating the measure of national prosperity, are as follows:

1920.....	101.2	1924.....	100.0 (base)
1921.....	77.3	1925.....	99.5
1922.....	88.9	1926.....	91.2
1923.....	93.3	1927.....	105.3

Material Handling Systems

An exceptionally comprehensive catalog of material handling systems has been put out by the Cleveland Electric Tramrail division of the Cleveland Crane & Engineering Co., Wickliffe, Ohio. It deals with overhead means of handling products of all descriptions, whether outdoor or indoor. Illustrations are numerous, including many taken in plants of users of the equipment. A large number of details is shown as to parts of the equipment, and, in particular, its flexibility is stressed. Both mono-rails and light cranes running on two rails are shown, together with gantry cranes, jib cranes, and other overhead types of handling facilities.

Mold Gates for Diverse Castings

Those Producing Whirling Action of Metal—
Riser Horn Gate and Pop Gate and Runner

BY PAUL R. RAMP*

[Following the first of three sections of this article, which appeared at page 943 of THE IRON AGE for Oct. 18, and in which the author showed correct methods of preparing gates for molds for face plates, die blocks, cast-teeth gears, driving box shoes and globe valves, Mr. Ramp in this installment takes up several other specific cases and tells why certain methods of treatment will give the best results.—*Editor.*]

Designing a Skim Gate

DETAILS of a standard skim gate, with four examples of how the skim gate can be used to obtain the benefits desired, are shown in the first illustration. Metal enters the pouring gate and is choked at the inlet gate *B*, and the impurities rise to the top of the skimmer *E*. But to have a standard in making these skim gates the various dimensions may be summarized.

When the pouring gate is 1 in. in diameter at *H*, the skimmer should be 2 in. in diameter at *I*. The distance *J* between the outside of the pouring gate and the outside of the skimmer should be no less than $2\frac{3}{4}$ in., if it is at all possible to have this much room in the flask. If the flask is not large enough for a skim gate of these dimensions, it is better to use a larger flask.

The passage leading from the pouring gate to the skimmer should always be as wide as the diameter of the pouring gate, and about $1\frac{3}{4}$ in. deep. This point is shown at *K*. Where this passage enters the skimmer at *L*, it should be as wide as the outside diameter of the skimmer and about $2\frac{1}{2}$ in. deep. These dimensions can be varied to suit conditions. The standard skim gate described here is what can be considered ideal. But the relation of the diameter of the pouring gate to that of the skimmer could not be worked out on a regular scale, at least any further than a 2-in. pouring gate and a 4-in. skimmer. There are few cases where a skimmer gate of this character would be used as large as this.

*Superintendent of foundry and pattern shop, Newport News Shipbuilding & Dry Dock Co., Newport News, Va.

Sketches I, II, III and IV are layouts showing different arrangements for the skim gate. Sketch I is of what might be termed a straight-away skim gate. The metal enters the pouring gate and travels in a straight line to the skimmer, and from the skimmer through the inlet gate to the mold. If the gate is filled quickly enough to choke at *A* this is a very effective gate. But Sketch II shows a more effective plan for skimming. The metal leaving the pouring gate flows into the skimmer and is forced to make a half circle before it can enter the inlet gate to the mold.

This creates a whirling action of the metal and forces all the impurities or lighter substances to the center of the skimmer, which allows them to rise freely to the top of the skimmer. Sketch III shows a more effective plan than Sketch II because the location of the inlet gate leading to the mold is located in such a manner as to create a still greater whirling effect. Sketch IV presents a method used to meet a different problem, where two castings are fed from the same pouring gate and skimmer. The arrows indicate the manner in which the metal enters and leaves the skimmer on its passage to the molds. This plan gives better results than would be obtained if a casting were poured with a gate similar to that in Sketch II.

The whole plan is to design a gate that will effectively choke the metal where it enters the inlet gates that lead to the mold, and at the same time provide a free escape for all impurities collected at this point.

Whirl Gate for Shaft Mold

ANOTHER view gives two cross-sections of a mold for a cast iron shaft or plunger or roller. This casting must be free from defects and should be cast on end in dry sand. The most effective gate to use on a mold of this character, to produce a clean casting, is a whirl gate as shown. Metal poured into the pouring basin *A* flows through the down gate and enters the whirl gate at *B*. It travels through the whirl gate and enters the mold at *E*. The circular view is a horizontal cross-section of the mold, showing the form of the whirl gate at *C*.

Skim Gate Arrangements, with Vertical Section (at Left) and Four Plans. Why one plan is better than another is explained in the text

The arrows indicate the manner in which the metal enters this mold on a tangent, compelling the metal to travel in a circular path until the mold is filled. This whirling motion forces all the impurities to the center of the column of metal and prevents any of it from clinging to the sides of the mold. The result is that all dirt and other impurities go up into the riser, above the upper limit of the mold proper. When the riser containing the dirt is removed, a perfect, clean casting remains.

Riser Horn Gates

OCCASIONALLY there are cases where a horn gate cannot be used in the drag part of the mold, and neither can the mold be gated on the outer edge, on account of a thin knife edge at this point; owing to the fact that a large riser or feeding head is desired in the solid hub, it cannot be gated in the hub. This condition presents another problem in gating, and the correct method in cases of this kind is the use of what we term a riser horn gate.

A riser horn gate is a horn gate that leads the metal directly into the riser, as shown in the cross-section of a disk mold with a heavy, solid hub. It would be impossible to gate this mold on the outer edge, which is indicated by *E*. Both sides of this disk blade, shown at *DDDD*, must be perfectly clean, which is another reason why the metal should

is the proper gating method used. This is illustrated in the cross-section of a sheave mold. The metal is poured into basin A. The basin must be filled very quickly in the beginning, so as to choke the metal at B, where it leaves the basin and flows through a pop gate down through the bottom of the hub at C. As soon as the hub is filled the metal flows toward the outer edge of the mold, indicated by D, continues to fill the mold up to E, and finally ascends to the top of the mold and up the riser. This plan distributes the metal evenly all over the mold and eliminates the possibility of the casting being thicker at one point than another. That happens often when a mold is gated on the outer edge, as more pressure is exerted there, which tends to strain the mold and make it swell adjacent to the gate.

not enter the mold at any such point as this.

For economical reasons it is not desirable to use the horn gate in the drag, as shown in our other sketch of a horn gate. (Page 945, Oct. 18 issue.)

To insure a solid hub, a riser or feeding head almost as large as the hub itself is used. This prohibits the use of a pop gate on the hub, and the riser horn gate is used as shown. In this case the metal is poured into the pouring basin and is choked at A, where it enters the horn gate; it then flows through the horn gate into the riser at B.

In daily practice, where a large variety of work is made, this combination of riser and horn gate is often very desirable. It is hardly necessary to state that it would be disastrous to attempt to pour a mold of this kind directly through the top of the riser, and expect to get a good casting.

Pop Gate and Runner

IN making molds for sheaves and other castings which cannot be poured at the outer edge, and which cover an area so great as to make it impossible to use a horn gate, the pop gate and runner

In making the pop gate the basin must always be lower at A, to provide the usual cushion for the metal to drop on. Care must be taken not to have the bottom of the pouring basin too close to the upper section of the mold. When the bottom of the pouring gate is too close, gas is confined between the basin and the upper section of the mold, and the result is either the bottom of the basin scabs or the upper section of the mold. If the bottom of the basin scabs there is danger of the loose sand produced finding its way into the hub portion of the mold. If the upper section of the

mold has scabs the casting will be found full of sand holes.

Pop gates as described here can be used effectively on pulleys, gear wheels and similar castings. But more care must be exercised in making a gate of this character than with any other kind. And more care must be used in pouring through a gate of this character, as the only place it is possible to choke the gate and hold back the slag is at the point where the basin enters the pop gate.

(To be concluded)

Gray Iron As An Engineering Material

More Knowledge Needed About Actual Strength in Castings— Vital Problems That Must Be Solved

AT a joint meeting of the Newark Foundrymen's Association and the Metropolitan Section of the American Society of Mechanical Engineers held in Newark, N. J., Wednesday evening, Oct. 24, J. W. Bolton, metallurgical engineer of the Lunkenheimer Co., Cincinnati, was the principal speaker. His topic was "Gray Iron: An Engineering Material."

The first part of Mr. Bolton's address was a brief review of the structure of gray iron, and its relationship to various physical properties. The speaker then devoted the rest of his time to a discussion of the engineering properties. Among the points stressed were the following: Reliability of gray iron castings has improved greatly during the last few years. This is particularly true in foundries utilizing technical control.

The most important theoretical development in gray iron metallurgy is the increased knowledge of the relationship of graphitic carbon to the mechanical properties of the iron. It was pointed out that highest strength irons usually are low in total carbon, with pearlitic or even sorbitic matrix, with small general grain size and, most particularly, with very fine distribution of graphitic carbon. The answer to the problems of cast iron as an engineering material is not universal adoption of higher strength cast irons. It is furnishing the engineer with more complete and accurate information of the various grades of cast iron so that he can make intelligent selection therefrom.

Knowledge of Strength in Castings Essential

Speaking of the necessity for soundness and uniformity it was reiterated that gray iron castings are produced which are as thoroughly reliable as can be cast in any metal. For design purposes the engineer must know the strength of the iron in the castings. The quality of the iron "in the ladle" is of no value to him. It is possible to correlate test bar results to properties of the metal in the castings so that the engineer can obtain a sufficiently close idea of the mechanical properties of the iron in the castings.

Careful analysis was made of the stress strain relationships characteristic of cast steel, gray iron, and bronze. Research by the speaker's company has shown that the initial permanent deformation of cast iron subjected to stress may approach zero on repeated loading. The modulus of elasticity of the material increases. Indeed the metal seems to approach the nature of a truly elastic material. It is suggested that it may be possible that the mechanical properties of gray iron improve under many actual service conditions. Furthermore, if initial set is permissible, the useful stress resistance of the iron may be a high proportion of the initial breaking load.

In a discussion of various other engineering properties

the speaker pointed out the excellent wear resistance of gray irons and deprecated condemnation of all grades of iron for use at elevated temperatures on account of failures occasioned by the selection of improper grades. Many irons retain their strength up to 800 deg. Fahr. and remain practically free from growth at this temperature. The lecture was concluded with the following summary:

Real Questions That Must Be Answered

It would be possible to go on at great length and in detail recounting the various grades of cast iron and their physical properties. But the questions before us are: What does gray cast iron offer the engineer? and how will the foundryman offer the engineer what he needs? Possibly these can be summarized as follows:

1.—Gray iron castings can be and are made with a degree of uniformity and soundness not exceeded by any cast product.

2.—They can be obtained with a tensile strength anywhere from 20,000 lb. to 60,000 lb. per sq. in. Excellent and easy machining grades corresponding to the American Society for Testing Materials high-test specifications of 33,000 lb. per sq. in. are made by many responsible foundries. Other lower strength irons have a wide field of usefulness.

3.—If a slight initial set is permissible, the useful strength of gray iron may be a quite large percentage of its ultimate strength.

4.—The low-carbon high-strength irons resist shock far better than the weaker varieties. The fatigue limit stress of gray irons may be 33 per cent of their ultimate strength.

5.—Gray irons have high hardness compared to their machinability. Their wearing properties are exceptional and deserve more attention from designers.

6.—Better grade irons maintain their strength and hardness well at elevated temperatures. Such irons are not subject to growth at lower temperatures—say under 800 deg. Fahr. for some conditions. The 450 deg. Fahr. restriction seems unfortunate when applied to better grades of iron.

7.—Gray iron resists some types of corrosion very well—for example, concentrated sulphuric acid and various caustic liquors. One comparison with steel is afforded by looking under some of the piers at Atlantic City.

8.—Easy machinability of gray iron has led to some abuses. Close grained tough iron naturally cuts a little harder than inferior grades. Considering its strength and hardness, gray iron machines very readily as compared to some other cast materials. One cannot have his cake and eat it too.

9.—The foundryman should know more about his own product to enable him to market it more intelligently. There are many grades of cast iron, and too little information available on any of them.

10.—The engineer needs more accurate and detailed information. It is up to the founder, through his technical and trade associations, to furnish the proper data. To do this costs money, and a penny-wise pound-foolish attitude is not going to advance the industry.

Points Way to Continued Prosperity

President Schwab Urges Institute Members to Cultivate New Uses for Steel and to Cease Price Cutting and Plant Expansion

COMMENTING on excellent current business conditions, which apparently are unaffected by the coming national election, President Charles M. Schwab of the American Iron and Steel Institute forecast a period of prosperity transcending anything yet experienced. In addressing the thirty-fourth general meeting of the institute at Hotel Commodore, New York, Oct. 26, Mr. Schwab not only emphasized the promising outlook, but urged the need for a policy that will at once give the iron and steel industry its deserved share of prosperity and a more definite assurance of continued good times. There are apparently three ways, he said, in which the industry can be stabilized on a prosperous basis. These are:

1. By stimulating the demand for steel.
2. By discouraging increases in producing capacity.
3. By avoiding uneconomic price cutting.

"For 10 years," Mr. Schwab stated, "we have been struggling to overcome conditions occasioned by the war period. These conditions are largely behind us and we are entering a constructive era of business engineering. . . . Our problems are not essentially different from the problems of other basic industries. They are not insoluble, but they must be solved in the future, as they have been in the past, without unlawful agreement, or collusion. They can and will be solved when we, the leaders of our industry, appraise better fundamental principles of economics, and apply them in our various lines of activities."

Mr. Schwab's address reflected a broad grasp of current business problems in their far-reaching ramifications. He saw in the new attitude of the public and the Government toward so-called "big business" one of the best promises of continuing prosperity. He recognized the stake American business has in maintaining the buying power of American workers. He commended efforts to improve the economic status of the farmer as of prime importance in

achieving a better distribution of prosperity, to the benefit of all classes and all industries.

Must Develop New Uses for Steel

"Much has been done," said Mr. Schwab, "to increase the demand for steel by finding new fields in which it may advantageously be used, but much more can and should be done. An extension of the activities of research departments not only to make improvements in the quality of our products and in the methods of producing them, but also to discover new uses for them, is desirable. A closer cooperation between the producers of steel and our customers, promoting a better understanding of our customers' problems and resulting in our providing steel which will more perfectly meet their requirements will often prevent the customer from seeking substitutes for steel. In these and many other ways the demand for steel can be increased and thus help to restore permanently a proper balance between demand and supply."

Better merchandising, particularly in pricing, was also urged by the speaker.

"If you buy any article of merchandise in a department store," asserted Mr. Schwab, "you know that you are paying substantially the same price that any other purchaser on the same day will pay, and that it is useless for you to discuss the price with the clerk for it will not be changed. The department stores long ago learned the economic necessity of maintaining a single price open to all. The steel industry has never learned this, or, if it has learned it, has forgotten it, and instead of charging a single price open to all, we in the steel industry have been charging many prices, often quoting different customers different prices for the same products on the same day. Such a policy has resulted, and will inevitably result, in harming certain of our customers through price discrimination and

Have Foundation for Unprecedented Prosperity—Charles M. Schwab

OUR country as a whole is still in the high tide of prosperity, and prospects for the immediate future are unusually favorable. The unemployment which existed in some measure a few months ago has lessened. Workers generally are now fully employed and at good wages. The relations between labor and management were never more harmonious, due to the wise attitude of co-operation and conciliation existing on both sides.

Business sentiment is good. This is particularly reassuring in view of the fact that we are to elect a new President of the United States within two weeks. It indicates that there exists little apprehension as to the results of the election and their probable effect on business.

Although we have had several remarkably good business years in this country, fundamental conditions remain sound and I say with confidence that there has been established a foundation upon which there may be built a structure of prosperity far transcending anything we have yet enjoyed.

in hurting ourselves by inviting our customers to haggle over prices, and tempting them even to misrepresent the prices charged by our competitors in the hope of coaxing lower prices from us.

Unjustified Discrimination Should Give Way to Open-Price Policy

"Now discrimination, as between customers, in prices which reflect merely differences in tonnages or differences in the character of service demanded by our customers are entirely proper. But there are other forms of discrimination in price based upon considerations less defensible. It is obvious that, inasmuch as steel is so heavy a product and the freight rate on a long haul bears so important an influence upon the final cost, it is advantageous to consumers and economical to the industry that in the great majority of cases the product should be supplied at a fair price from the nearest available plant. For a manufacturer a considerable distance away to underbid the fair price offered by the nearby plant is obviously uneconomical and tends to indiscriminate price cutting and to cross-hauling, an unwise practice of our industry to which I referred at some length in my talk last May.

"No one will deny that the maintenance by each producer of any basic commodity of substantially uniform prices, at a proper level, is a desirable thing not only for the producers but also for the consumers. Fluctuating prices compel the consumers to speculate on the cost of their raw materials. Such stabilization of prices is entirely possible of attainment without agreement or collusion on the part of the producers. It requires merely a general recognition by the producers of two simple facts, viz.: 1. The steel business is unlike many other industries in that, within certain limits, the demand for steel products is not appreciably affected by the general price level, and, therefore, a general reduction in prices for steel products alone does not result materially in increasing demand; and, 2. It is not possible in a basic industry like ours to make effective for long at any one point two different prices for the same commodity.

"When one producer lowers his price for a particular commodity, that price will promptly be met by his competitors. The net result in the long run is that each producer continues to produce substantially the same percentage of the total tonnage as before, but with a smaller profit margin, and sometimes none at all. I believe that a general recognition of these two facts would go far to remove the first economic cause of our failure to share in the general prosperity of this country, and that the adoption of the policy of open prices, open to all without preference or discrimination, would be of benefit alike to our industry and to our customers."

Favors Moratorium in Plant Building

Construction of additional steel-producing capacity should be discouraged by every lawful means, according to President Schwab.

"The law of supply and demand is inexorable, and if the producers of steel in this country do not voluntarily refrain from expanding capacity beyond the needs of the country, they can expect only one consequence. The law of supply and demand will promptly operate, reducing profits to the extent necessary effectively to discourage new construction, and that conditions will continue until demand has again increased sufficiently to take up the excess capacity. I wish it were possible to have a temporary moratorium on the construction of steel capacity in this country. I firmly believe that, with such cessation of new building, the relationship between demand and supply can thus be established on a basis which will insure fair and reasonable profits in the industry for many years to come, for, while our industry will, I trust, never cease growing, in my judgment the technological developments

resulting in improved processes and enlarged units alone will render unnecessary for a considerable period the building of new plants to meet increased demand."

Mr. Schwab stated that steel-making capacity in the past 12 years had been sharply increased not only by new construction to meet the demands of the war, but by improvements in methods and practices since the war.

"Coincident with this increase in our capacity there has been a smoothing in the curve of demand that has largely eliminated the peaks and depressions in the demand for steel with which the industry was familiar before the war. Whereas formerly demand exceeded capacity during certain periods, it does so no longer, and in more than five years there has not been a time of any substantial length when the capacity of the industry was unable to supply promptly the peak demand. The result has been that at no time in the last five years, until very recently, has the law of supply and demand operated to improve prices in our industry.

Steel Consumption Growing at a Slower Rate

"Along with the large increase in the steel capacity of this country, there has been, and always will be, a steady increase in the demand. But in one respect there has occurred an important change—in the past the rate of increase in demand was very rapid, and demand doubled about every 10 years, an average increase during each decade of 10 per cent per year. No longer does it increase at the old rate. It has not doubled during the last 20 years, and in the 15 years since 1913 it has increased only about 55 per cent, an average increase of less than 4 per cent per year. Consequently, although formerly the normal increase in demand afforded a prompt corrective of an over-expanded capacity, it no longer operates so promptly.

"In other words, we can no longer blindly increase our capacity relying upon the normal increase in demand to correct quickly our errors in over-building. Here is a fundamental change in our industry the significance of which has apparently not been generally realized and the present seems to me a peculiarly appropriate time to urge it upon your attention.

"Following an unusually active summer the steel industry is now operating at about 90 per cent of its capacity, and as we enter the fourth quarter there is every indication of a sustained demand that will insure a high rate of operations for the balance of the year.

"It is now a certainty that the year 1928 will establish a new record in volume of production for the steel industry of the country. Insofar as an increase in demand is the solution of our economic difficulties we are nearer to a proper relationship between supply and demand than we have been since the end of the war. This increase in demand has resulted, as should be expected, in a betterment in prices—virtually the first improvement that has occurred in five years. I hope and believe that there will be a still greater improvement in prices, sufficient to afford to the industry a return upon its investment fairly comparable with that realized by other leading industries.

"But, once a fair price basis is established, how long will it continue? As long, I say, as the proper relationship between supply and demand is maintained."

Mills Should Be Paid for Quality and Service

The price per ton that mills charge their customers is not the main consideration in relations between sellers and buyers, according to George M. Verity, president American Rolling Mill Co., Middletown, Ohio, who also addressed the institute. There is a factor of quality, service and understanding of the customer's product which is far more important. From the customer's point of view an increase in price of \$3 to \$5 a ton is insignificant; he is not interested primarily in the cost of his raw materials, but rather in his total manufacturing costs. The mills, said Mr. Verity, are

entitled to a price for the product itself, and for the quality and service they give the customer. He considered it important that steel manufacturers establish a close liaison with the users of their products.

Speaking of the difficulties that have arisen from surplus steel-producing capacity, Mr. Verity said:

"We must come to the time when the problems of production may be controlled in some legal way that will not be opposed to public interest. It can be done. It must be done."

Commenting on the fact that the steel industry has not been receiving a fair return on its investment, H. S. Wilkinson, chairman of the board Crucible Steel Co. of America, New York, said that he believed a point had been reached when benefits were accruing from the cooperative spirit manifested in discussing business difficulties.

"I believe there is more confidence among members of the steel industry today than there has been since the war," he said. "I believe there is a feeling of confidence in each other that has not existed since 1920. I believe that we are going to have an increased return and that we are entering the greatest era of prosperity since 1920."

While the steel industry will undoubtedly produce a record tonnage this year, with profits above the average, Willis L. King, vice-president Jones & Laughlin Steel Corporation, Pittsburgh, said that a serious problem is still unsolved—the proper merchandising and distribution of its products.

Myron C. Taylor Is Banquet Speaker

The banquet, held in the evening in the Grand Ball Room of Hotel Commodore, broke all records for attendance, with a total of over 1750. The principal speaker was Myron C. Taylor, chairman of the finance committee of the United States Steel Corporation. He paid tribute to the leaders of the steel industry, past and present. He saw an interesting parallel in the lives of Charles M. Schwab and James A. Farrell, both of whom rose from the ranks to leadership in their respective companies and both of whom retained the affectionate regard of their employees. His reference to Mr. Farrell as the "big man of the Steel Corporation

today," was the signal for an ovation that the latter was compelled to acknowledge.

Work, according to Mr. Taylor, is the great secret of prosperity. He saw much to be thankful for in the fact that George F. Baker, Jr., and the younger J. P. Morgan, both sons of extremely wealthy fathers, are devoting their lives to work.

Dr. Eckener a Banquet Guest

Dr. Hugo Eckener, commander of the Graf Zeppelin, briefly acknowledged the cheers that greeted him when he was introduced, and, in discussing the progress in modern air transport, said that dirigibles must, and can be expected to, increase in speed, safety and practicability.

Other distinguished foreigners who spoke were Aloyse Meyer, chairman of the International Steel Cartel and president of the Acieries Reunies de Burbach-Eich-Dudelange, Luxemburg, and Ernst Poensgen, Stahlwerks Verband and United Steel Works Corporation, Düsseldorf, Germany. M. Meyer said that what impressed him most in the American steel industry was the spirit of cooperation and collaboration that existed between management and workers. He called attention to the fact that, in visiting the country making the largest total tonnage of steel, he came from a country with the largest production per capita, 10 tons per year.

Other features of the banquet program were an address by Dr. Harry Emerson Fosdick, pastor of the Park Avenue Baptist Church, New York, and brief remarks by Dr. Elmer A. Sperry, of the Sperry Gyroscope Co.

Gary Medal to Be Awarded in Spring

At the meeting of the board of directors of the institute it was decided to award the Elbert H. Gary medal, for the most notable service to the iron and steel industry, in the spring, and the American Iron and Steel Institute medal, for the best paper of the year, in the fall. E. T. McCleary, president Republic Iron & Steel Co., was elected a director of the class of 1929. The membership of the institute was increased from 1600 to 2000; the number of associate members was raised from 600 to 800.

Abstracts of the technical papers follow:

Acoustic Laboratory for Testing Music and Other Steel Wires

BY WILLIAM BRAID WHITE

THE American Steel & Wire Co. during many years has specialized in the manufacture of wires for the music industries, meaning by that steel wires for pianos, for mandolins, guitars and banjos, for the E strings of violins, and so on. The aggregate amount of the wire thus made may

be called great or little, depending upon whether the output is measured by the ton or by the mile. A ton of piano wire of mean diameter will run to about 70 miles of length.

Piano wire output from the viewpoint of tonnage is, therefore, small, yet when we take into consideration all

BORN in Great Britain in 1878, William Braid White was graduated from Cambridge University. He became interested in musical acoustics more than 25 years ago while acquiring a practical knowledge of musical instrument manufacturing in New York, where he settled 28 years ago. In 1904 he became, and has remained, technical editor of the "Music Trade Review," New York. In 1921 he opened a laboratory in Chicago for the more practical study and investigation of acoustic problems with special reference to piano construction. In 1927 he became acoustic engineer of the American Steel & Wire Co., which position he still holds. He is a member of the American Society of Mechanical Engineers, the American Physical Society, the American Iron and Steel Institute, the American Association for the Advancement of Science, and the American Astronomical Society. He is the author of a number of books and technical papers dealing with subjects in his field.

the piano wire, all the spring wire which is in effect piano wire not up to piano requirements, and add to this all the wire used for musical strings in the smaller musical instruments, we have quite a respectable output. Furthermore, this is not the sort of product which can be turned out by the thousand tons in the certainty of the first and the last inch-length being exactly the same. The making of music wire is something which brings the steel mill and the wire drawer into a contact, far closer than most people would suppose possible, with the science of acoustics and the art of music.

So much has been realized for a long time, and means had been sought whereby closer liaison between makers and users of steel music wires might be perfected, but it was only during very recent years that such a contact became really practicable upon a sufficiently large scale. About two years ago it became certain that the manufacture of music wire would be greatly benefited by the establishment of means whereby the requirements of musical instrument

that it anticipates rather than follows. When a great industry that is an outlet for certain special products of a manufacturer of basic material is in a position where it needs technical assistance, but at the same time is not organized to provide this from within its own resources, it is wise to proffer that assistance if it is possible.

Then, again, when a manufacturer of basic materials discovers that he can learn hitherto unknown but very valuable facts about his own product, considered from the point of view of the user primarily, and only secondarily from that of the maker, he is merely being wise in putting the discovery to account and making the most of it. That is what we have been doing in the field of this extremely specialized and highly organized product, piano wire.

We believe that we have in this laboratory started something new and valuable. The great constituent factors of the steel industry are not in the public mind usually associated with anything so ethereal as sound waves. Yet, if what I have told you has meant anything at all, then surely there is no field more favorable for the operation of the policy of constructive anticipatory research than is furnished by the music industries, the greatest and most important part of which depends absolutely upon steel wire for the very heart of its products. One might indeed speak of "the steel heart of music" and the title would be both appropriate and significant.

There is a last point to be considered, which indeed contains the conclusion I wish

*Measuring Tensions in Steel Wire
Piano Strings in the Acoustic Laboratory*

manufacturers might be more nearly determined, and to some extent anticipated.

We have been much interested in the fight which the American music industries have been making. Realizing that music in America is becoming steadily more important, and that the annual expenditures on music are increasing even faster than the increase of population, we have faith in the future of American music industries. Consequently, when it became evident that these music industries would encounter unexpectedly strong competition, we saw an opportunity to accomplish simultaneously two much needed and rather important pieces of work:

First, to accumulate a mass of much needed facts about the actual behavior of steel wires in musical instruments, to the end of thereby acquiring knowledge which could be put to use to good advantage in our drawing mills.

Second, to furnish through the same methods to the music industries technical assistance to help them to improve their methods of construction, bring their designs and production up to date, build better instruments without increasing costs already high, and in general adjust themselves to new conditions.

It was felt that the only way of increasing the output of music wires was to do whatever could be done to assist the sale of musical instruments, and that this in turn meant, so far as we were concerned, rendering scientific help in the way of research into fundamentals and the development of new ideas that might be of use to the music industries.

[The author then describes the apparatus and methods used in carrying out this research.]

It may now justly be asked: to what is all this leading? In the first place, it is a characteristic of industry today

to draw. The accomplishments of research departments in the automotive, the electrical and the chemical industries have habituated the public mind to the thought of applying scientific methods to large-scale business. Research really means nothing more than fact-finding; and scientific wonders, so-called, are merely the result of applying accuracy and patience, backed up by suitable apparatus, to the task of finding facts. Today we live in an age of substitutes and adulterants as well as of new discoveries and new applications of old ones.

No industry, however well founded it may think itself to be, can afford to neglect the possibility of some future, perhaps already imminent, form of competition arising from new discoveries in synthetic chemistry or in applied physics. Did the wire industry foresee that hairpin wire, for instance, would suddenly cease to be an important product? I could multiply examples, but my meaning will be understood. I say that today every great industry must face the fact that the application of scientific method is turning things upside down all over the world, and that no amount of good will, no magnitude of operations, no apparent essentiality of product, can render any industry safe that does not take into account the possibility of substitutes arising to steal away its most profitable markets overnight.

The research that you have seen and heard described may seem but a small thing; but it gives an idea of the field that is open to development. It is plain that industrial policy during the next few years must run in the direction of determining scientifically better methods of manufacture, reducing costs and improving product, while continually maintaining a contact through technical service and anticipatory research with the minds of customers, ascertaining

not only their wants of today, but their probable wants of tomorrow.

Opinions of Piano Makers and Users

FOLLOWING a very interesting and somewhat extemporaneous presentation of the paper by Mr. White, accompanied by an exhibition of some of the apparatus used in his laboratory, Ernest Schelling, an eminent pianist and composer, played two compositions upon a grand piano, the strings of which had been scientifically investigated by the methods illustrated by Mr. White. Preceding the playing, Mr. Schelling voiced his thanks that this is not entirely a wireless age and stated that in playing the Polonaise by Chopin, it was estimated that the energy expended by the pianist was equal to that necessary to lift two tons one foot. Mr. Schelling then performed in his masterful manner this classic composition by Chopin and later played as an

encore the "Bells at Ragusa," a place located along the shores of Dalmatia. This was presented by Mr. Schelling as an illustration of over-tones and it is understood that it was his own composition.

Commenting on Mr. White's paper, Paul H. Bilhuber, assistant manager of the factory of Steinway & Sons, New York, said that piano makers are demanding a better wire and that the cooperation between them and Mr. White's laboratory was resulting in mutual benefit. The problem before the industry was the securing of a rust-resistant wire, and he said that he felt if an alloy steel wire could be successfully produced which would be suited both for tonal effect, as well as strength, it would be superior to the present article. Wires plated with cadmium, tin and zinc had been tried, but were unsatisfactory, due to a tendency to chip and other defects. Mr. Bilhuber said that plating wire with chromium was a possibility on which more work is necessary to ascertain whether the tendency to inferior tonal results could be overcome.

Uniformity, Continuity and Magnetic Testing

BY A. V. DE FOREST

A MOVING picture constituted the principal part of the paper by A. V. de Forest. It was accompanied by explanatory remarks as the various features of certain phases of the magnetic testing of steel were unfolded on the screen. In substance Mr. de Forest said:

The term uniformity is used to mean the similarity in composition, grain structure, strength, hardness, etc., that is obtained in different pieces of steel or different portions of the same piece. Continuity on the other hand is a question of the physical integrity of the material—the absence of seams, transverse fissures, unwelded blow-holes and mechanical imperfections in general.

The usual methods of test, chemical, microscopic and mechanical, assume uniformity between test specimen and product. This assumption can be verified and large quantities of material tested by non-destructive magnetic methods. In general, different methods must be used to distinguish discontinuity from non-uniformity. The nature of the product will determine the most advantageous form of test. In some cases both are necessary.

The moving picture shows the various ways of making magnetic tests, and the kind of information that may be gathered with the different methods. The oscillograph record of the varying magnetic properties of a spring is shown as usually plotted against a continuous timing line,

and also in the form of a cyclogram or closed loop using a harmonic timing line. The mechanism of the alternating current galvanometer with separately excited field was described and the valuable features of this form of test were indicated.

Locating Fissures in Steel Rails

SOME of the recent results which have been obtained by a new method of locating defects in rails were described by Dr. Elmer Sperry of Brooklyn, after the presentation of Mr. deForest's paper. Doctor Sperry recounted some of the early history of efforts to locate fissures in rails by magnetic analysis and mentioned the work of the Bureau of Standards and some American inventors. He said that in order to show up the true inwardness of a bar of steel, it is really necessary to submit it to electrical energization, and he said that it was on this principle that his new apparatus had been constructed after consultation with various scientists in this country. It had been found by the use of this apparatus that fissures in rails can be accurately located within 1/32 in. of the actual place where they exist. It is accomplished by passing 2000 amp. of current through the rail which, if the rail has no defects, will record a straight line on the recording apparatus, but if there are

FOR a number of years A. V. deForest has been studying the magnetic properties of steel and, more especially, the correlation of these properties with metallography and physical properties. He is recognized as one of the leaders in research work in this field in the United States. He was graduated from the Massachusetts Institute of Technology in naval architecture in 1912 and was with the New London Ship & Engine Co. for a year, after which he became an instructor in civil engineering at Princeton University. Later he studied metallography at Princeton and Columbia Universities. He then spent two years in the research department of the Remington Arms Union Metallic Cartridge Co. In 1918 he assumed his present position as research engineer with the American Chain Co., Bridgeport, Conn.

any defects, the current is obliged to pass around them and thus immediately the location is recorded. By special equipment the rail is marked with white lead at the point where the defect is revealed. Doctor Sperry illustrated some parts

of his apparatus by slides and said he felt that the problem of detecting unsound rails had been solved. A detailed description of his new apparatus will appear in a later issue of THE IRON AGE.

Present Status of Structural Steel Welding

BY F. T. LLEWELLYN

SEVERAL questions were asked two and a half years ago by I. H. Edwards, chief engineer American Bridge Co., that have formed the basis of an extended research, under the latter's chairmanship, by the American Bureau of Welding. This investigation (which is yet uncompleted) covers 57 forms of simple joints in 191 sizes, welded by gas or arc. In order to determine the degree of uniformity of commercial practice that may be expected, multiple specimens are being made by 36 representative fabricators, governed by uniform procedure and inspection regulations. In the light of such results as are now available, and of the common experience of the welding industry, the answers to the questions are as follows:

1. *Can standard grades of steel be satisfactorily welded?*

The unqualified answer is "Yes" for structural steel conforming to Specifications A-7 or A-9 of the American Society for Testing Materials. The weldability of these goods is established by thousands of tests, and by satisfactory service of welded joints in important commercial structures in every section of the country. Proper welding wire must be used. (The discussion is confined to direct-current metal-arc welding.) The wire used engraves its indelible signature on the weld. American Welding Society Specifications E1A (maximum carbon, 0.06 per cent) or E1B (carbon, 0.13 to 0.18 per cent) will prove adequate.

2. *What effect will the welding operation have on the base metals that are to be united?*

The answer is that it will have no harmful effect—certainly not if the base metal is mild steel. This feature can be presented more clearly with the aid of a diagram drawn to an enlarged scale. Referring to the weld as a whole, it has been well said that welding wire normally deposits a soft steel that is purer than its source. This refers to the typical zone in the body of the weld. The transition zone never attains a thickness of 0.04 in., and only about 0.01 in. consists of the portion where there is interpenetration of base and weld metal. It is sometimes invaded by impurities from the base metal, but no impurity in the weld metal ever penetrates beyond the transition zone into the base metal. Therefore any effect of the welding

operation on the base metal beyond must be merely a thermal one.

Micrographs show that the transition from base to weld metal is marked by a reduction in grain size, that is to say, by a refining effect, but it is also sometimes accompanied by more slag inclusions than occur in other portions of the weld. In welds properly made, with good wire, these inclusions are too minute to be visible to the naked eye and should not be considered as serious defects. They do mean, however, that the metal in this zone is 70 to 85 per cent as strong as that in the body of the weld.

This weaker zone is compensated for by providing contact surfaces that are greater than the throat dimensions. In triangular fillet welds the ratio of the leg of an isosceles right triangle to the normal to its hypotenuse is happily greater than is required.

Reverting now to the thermal effect of welding: The heat is conducted across a much narrower belt than is commonly supposed. While the temperature of the arc is high, its duration at any point is brief. The base metal is raised to a bright red color over a belt whose width varies with its thickness and with the volume of the weld. It then cools freely in the air. This means that near the weld the piece undergoes precisely the same treatment as would normalize mild steel.

While this indicates that the welding operation has no harmful effect on the base metal, and why rupture (in the base metal) is more apt to occur near the weld rather than at a remoter point, it does not explain why rupture is less frequent in the weld itself. The reason is that while ordinary weld metal has a somewhat lower ultimate strength than the base metal, it has a much higher yield point. Therefore, necking, and consequent rupture, is apt to start in a normalized part of the base metal rather than in the weld.

3. *Can methods of making welds by different processes be standardized?*

The answer to this question is "Yes"! Specifications covering the making of welds by the direct current metal-arc process, and by the oxy-acetylene gas process, have

BORN in Cardiff, Wales, F. T. Llewellyn was educated in Welsh and English schools and came to this country late in 1890. His first position was in the structural steel department of the Gillette-Herzog Mfg. Co., Minneapolis. Later he was representative of this company in New Orleans, La. He supervised the first skeleton tier building in that city and the first steel frame building in Louisiana. From 1906 to 1917 he was engineer in the New York office of the Carnegie Steel Co., devoting his attention to the development of new products. In 1917 he was loaned to the Emergency Fleet Corporation and devoted his attention to the simplification of steel requirements for ships, and in allotting steel to shipyards. From 1919 to date he has been attached to the president's office of the United States Steel Corporation, and has concerned himself with new products, especially in the structural field. Mr. Llewellyn is a member of many of the American technical societies and clubs, and is president of the American Welding Society.

already been prepared by the Structural Steel Welding Committee. Already we are using $\frac{3}{8}$ -in. fillets as standard in much the same way as $\frac{3}{4}$ -in. rivets have been standard.

4. Can values be fixed on some unit basis for the strength of the more usual types of welded joint?

To this question a qualified answer is given. For quiescent static loads, "Yes"! For dynamic loads, "Probably Yes"! Welded joints subjected to considerable shock require further investigation. It does not follow that welded joints are unsuited to resist shock. Many structures are now in use where they perform this function very efficiently. It is a fact, however, that knowledge as to their precise behavior under shock is limited, and the need for further study along this line is urgent.

In order that working values may be useful they must be expressed in units that can be readily checked in shop or field operations. For butt welds the throat area is a suitable criterion, disregarding any reinforcement. For fillet welds in practice it seems advantageous to express values in terms per linear inch for each size of weld. The figure shows gages used by the Newport News Shipbuilding & Drydock Co. for some years, and the method of application. Checking the number, length and location of welds is also essential.

Allowable working unit values for fillet welds appear to be crystallizing at about 28 per cent of the ultimate strength under shear of the neat weld metal. This percentage assumes the depth of throat to be the minimum permitted by the gages. Thus, a value of 3000 lb. per linear inch is in frequent use for the popular $\frac{3}{8}$ -in. fillet. Since the yield point of structural steel is much lower than that of weld metal, the same factor of safety (figured on the ultimate strength) will give a bigger margin in the joint before permanent set occurs under working loads.

5. Is there some way of determining the reliability of the completed weld?

This is doubtless the most important question to be answered. From a rigorous standpoint Mr. Llewellyn believes that we can no more be certain that a specific portion of weld is sound, without destroying it, than we can tell whether a specific rivet fills the hole, without destroying it. Expressed conversely, it is just as possible to determine the reliability of a completed weld as it is possible to determine the reliability of a riveted joint.

Diagrammatic Section Through Fillet Weld

We have confidence in rivets, and rightly so, not because the inspector's hammer rings true when applied to their heads (it is well known that a poorly driven rivet can be given a resonant head), but because we have used them with satisfactory results over a long period. Confidence in rivets has been a thing of growth. Thirty-five years ago all structural specifications limited field rivets to only two-thirds the value allowed for shop rivets. Today that classification has gone, and the distinction is between hand-driven and machine-driven rivets. We have acquired confidence in the machine-driven rivet.

"If welding is to be considered seriously as a structural tool, similar confidence in its results must be given opportunity to develop." He cited the following means for attaining that end: (a) By familiarity with the process in the shops. (b) By removal of short sections of the joint for examinations, (c) By proof loads. (d) By testing the welder's qualifications. (e) By using proper welding wire.

6. Can the welding operations be done at a competitive cost?

With fabricating shops organized along existing lines in which welded jobs are undertaken only occasionally, competitive costs can be secured (a) on low beam-and-column buildings whose details are sufficiently simple to permit the rolled steel members to be shipped unfabricated from the mill direct to the site; (b) on shop-welded structures where savings in weight are securable, notably in truss-work wherein the net section of tension members is a criterion and where gusset plates and other expensive details can be largely eliminated; (c) on existing bridges and other structures which require reinforcement to meet added loadings.

On the other hand, competitive costs may not be securable on tall beam-and-column buildings, whose details require shop preparation, until such time as there is enough business of this character to occupy a shop continuously.

"There is a class of tall beam-and-column buildings which can be welded with advantage, regardless of present costs. This class embraces additions to buildings already occupied, where the elimination of noise during construction has real monetary value. Hotel owners are becoming alive to this feature and it is also a factor in some other commercial buildings, as well as in the case of hospitals and colleges. The saving of space during alterations, and the smaller amount of demolition made possible by welding,

Gages for Fillet and Butt Welds

also make this process economical as applied to the detailed connections of a new to an existing structure."

Other Welding Problems Mentioned

SOME further problems are worthy of study, said Charles Schenck, production engineer, Bethlehem Steel Co., Bethlehem, Pa. First, relative corrosion of weld and base metal. His experience indicated that welds made with standard bare wire rusted rapidly; coated or covered electrodes were more resistant. Meanwhile paint could be relied upon to keep this corrosion in check. Second, the scattering results of published fatigue tests on welds indicated that none of them could be relied upon. Here again, coated electrodes seemed to give better results, but the matter needs to be investigated. Third, low impact values of electric welds seem to be associated with the so-called tearing tendency of weld metal. Whether this can be improved by depositing cleaner, sounder metal, or by a different design of joint should be determined. Fourth, something ought to be known about the reason why light welds withstand higher unit shearing stresses than heavier beads.

Lastly, a similar study should indicate the reason why short welds are stronger, per unit, than long welds. Until these last two questions are answered, designers will rely upon "skip" welding, that is, getting the necessary strength by a large number of short, small fillet welds.

George H. Danforth, contracting engineer Jones & Laughlin Steel Corporation, Pittsburgh, said that his company had experienced great satisfaction in building welded structures when careful attention is given to details to simplify the design to avoid a multiplicity of small parts, and to provide for mill variations in lengths and section size. He described in some detail the building erected for the Westinghouse company at Derry, Pa. (see *THE IRON AGE*, Oct. 6, 1927, page 944). More recent experience convinced him that that building had two times as many erection bolts as necessary. In one recent plan examined there were only 15 holes for connection of companion material required on 484 purlins. In his experience one welder per 100 tons of steel would give a good erection rate, especially since no scaffolding would ordinarily be required. Recently he had offered \$5 a ton concession to be permitted to weld a 1-story shop building.

Steels Used by the Automotive Industry

BY W. J. MACKENZIE

AUTOMOTIVE steels in general use today are the nickel steels (S.A.E. 2000 series), chromium-nickel (S.A.E. 3000 series), chromium-molybdenum (S.A.E. 4000 series), chromium (S.A.E. 5000 series), chromium-vanadium (S.A.E. 6000 series), silico-manganese (9200 series), and the manganese steels (G.M.C. 1300 series).

The bulk of these steels are made by the basic open-hearth process. The figures for 1927 show that approximately 81 per cent of the total tonnage of alloy steels of all types was made by this process. This 81 per cent is to a large extent used by the automotive industry. Briefly, the basic open-hearth alloy steel process consists of producing a super-refined carbon steel, during or at the completion of which refining period the alloying elements are added.

Steels of Homogeneous Character

Close chemistry is not enough. To satisfy the industry (whose demand is for maximum freedom from segregation, the utmost in soundness, the minimum amount and size of non-metallic inclusions, controlled grain size, and all the other modern requirements of quality steel) much has been

learned, but a great deal still remains to be worked out.

High physical properties are necessary to resist the wear, fatigue and complex arrangement of dynamic stresses which obtain in the members of a light-weight, high-speed motor car. As an example, we produce daily a common S. A. E. alloy steel for gears which, with a single treatment, shows physical properties of 275,000 to 300,000 lb. to the sq. in. tensile strength, and a reduction of area of 35 to 45 per cent, at a minimum Brinell hardness of 500.

The automotive engineer today designs his parts with full confidence that the steel specified, when properly treated, will have the desired physical properties—i.e., will do the work intended. This is the result of years of experience and cooperation with the steel maker. Present chemical and physical specifications have been the outgrowth of this experience.

Uniformity a Prime Essential

Steels of uniform properties are necessary to the manufacture of parts which are to be free from distortion, and of suitable physical strength after the mass-production methods of fabrication, treating and testing employed to-

AFTER being graduated from Harvard in 1913 with the degree of B.S., W. J. MacKenzie went to work for the United Alloy Steel Corporation, Canton, Ohio. He was associated with that company in various capacities until he joined the Central Steel Co. at Massillon, Ohio, when that company started operations. After spending about a year and a half at Massillon, he returned to the company at Canton with which he was first associated, where he stayed until May, 1918. In that year he joined the newly formed alloy steel organization of the Interstate Iron & Steel Co., Chicago, with which he has been connected until the present time. Mr. MacKenzie is now vice-president of the company.

day. The automotive manufacturer can meet his schedules, calling for thousands of cars a month, because he gets uniform steels.

He knows he can set his automatic machines to get hundreds of machined parts per tool; he knows that all he has to do is to set his heat-treating furnaces at certain prescribed temperatures and day in and day out he will get finished parts of uniform physical properties. He has made an immense saving in time and money. I know of one large manufacturer who uses cold drawn nickel steel instead of plain carbon steel, which has all the strength required, because he can get a greater number of finished parts at a lower cost from the alloy steel, due to its uniformity.

[The author here launches into a consideration of the more important of the S.A.E. steels, of which he gives a comprehensive table. He tells what each type can be expected to do, where it is employed and how it is heat-treated.—*Editor.*]

Specifications Not What They Might Be

IN discussion of Mr. MacKenzie's paper, Dr. John A. Mathews, vice-president Crucible Steel Co. of America, remarked that standard specifications usually are com-

promises and rarely are entirely satisfactory to either maker or user of the material. Ordinarily they do not result in furnishing the highest grade of material. The speaker quoted from typical specifications of a generation ago, in which demand was made that "all seams, slivers, slag, dirt, etc., etc.," be eliminated from the steel. More recently certain specifications have required that the steel be a "perfect steel." Any material which can be manufactured commercially can with strict interpretation of either of these requirements be rejected, and this might easily happen on a falling market or on a long inventory.

Preparations are being made by Engineering Foundation to study the entire range of alloy steels. When the survey of our present knowledge on the subject has been charted, there probably will appear certain gaps. These will have to be filled in by special investigations. Then, with considerable assurance, it will be possible to select specific steels for special purposes and not leave the matter so much to chance as at present. Purchasing agents now often make selections of material with which they have become familiar; this, in the first instance, usually involves having had it recommended to them by the seller. This practice is not in the interest of best work and should be abolished in favor of intelligent selection from known characteristics of the material.

Observations on European Iron and Steel Conditions

BY C. A. MEISSNER

ITALY, France, Switzerland, Germany and Luxemburg give a first impression of general recovery and improvement in living conditions, and certainly in many respects improvement in industrial conditions.

About 50 per cent of all rail ties in Germany are made of steel and it is proposed by the Government Railways to increase this proportion to about 66 per cent of the total. Great attention is paid to the manufacture of steel rails and fittings, and the road beds admit in many cases of heavy trains running 50 to 60 miles an hour. There are through trains of steel construction, commodious and comfortable.

Rails up to 90 ft. 9½ in. are rolled, the long length being used more and more. All rails are straightened on roller straighteners, which seem to give satisfactory results and eliminate hand straightening, except for occasional twisted rails. Large section rails have about 0.5 per cent carbon and 0.40 to 0.60 per cent manganese.

An interesting feature in Italy, and really through a great part of Europe, is the intensive use of cable bucket

systems carrying materials from the docks and stock piles to the plants. Also, in many cases, long-distance cable systems were seen for minerals, lumber and other materials.

Large Blast Furnace Outputs

At Hamborn furnaces, near Düsseldorf, daily average production through a year on 16-ft. 5-in. hearths, in good condition and with good ore mixture, has been as high as 835 tons. This they attribute largely to the open nature of the burden. Daily averages for a month are sometimes as high as 850 tons and have reached 920 tons. Productions of 950 to 1000 tons are occasionally made for a day or two. The present daily average production, because of poor ore mixture resulting from the Swedish mine strike, is 700 tons. Average production for a campaign is about 1,200,000 tons. Varying amounts of sinter are used.

On good ore mixture slag volume is about 1100 lb. per ton of iron. On present poor ore mixture it is about 1760 lb. On good ore mixture the coke rate is from 1716 to 1870

SINCE 1905, or for 23 years, Carl A. Meissner has been chairman of the blast furnace, coke oven and open-hearth committees of the United States Steel Corporation at 71 Broadway, New York. He received a degree of Ph.B. from the School of Mines of Columbia College in 1880, and in 1915 the same institution bestowed upon him the degree of M.S. His first position in 1880 was assistant chemist, Joliet Steel Co., Joliet, Ill., and between that time and his connection with the Steel Corporation in 1905 he held positions with the Brier Hill Iron & Coal Co., Youngstown, Ohio; Vanderbilt Steel & Iron Co., Birmingham, Ala.; Londonderry Iron Co., Londonderry, Nova Scotia; Dominion Iron & Steel Co., Ltd., Sydney, Nova Scotia, and other Canadian companies. He is a member of several American technical societies and has published a number of articles on technical subjects.

lb. per ton on larger furnaces, depending, of course, on age of furnace.

Blast temperature is generally 950 to 1100 deg. Fahr. throughout Germany; higher heats slow the furnaces down too much. Hamborn is using 1200 deg. Fahr. However, one plant at Saarbrücken, France, expects to go to 1550 deg. Fahr. on minette ores and sinter. The general feeling is that there is no limit to stove heat, up to what the furnace will take without slowing down.

Cleaning of blast furnace gas by electrical precipitation is arousing a great deal of interest throughout Central Europe. Among the reasons given for this interest are the following:

1. Power consumption of electric cleaning is about one-tenth that of wet washing.
2. Cost of sludge disposal from wet washers is high.
3. Difficulty of waste water disposition is serious in some sections.
4. Shortage of water at some plants makes wet washing objectionable.
5. Several plants are putting in turbo-blowers and so do not need such clean gas as would be required for gas engines.
6. The saving of sensible heat, even after gas is partially cooled in primary coolers, is considered to more than offset the extra moisture carried by the gas.

Ferromanganese at 300 Tons a Day

One blast furnace making ferromanganese at Meiderich is noted in Europe for its large production. Hearth diameter is 11 ft. 6 in.; coke rate, 4070 lb. per ton; production, 280 to 300 tons a day of 78 per cent ferromanganese. The stove heat is 1380 to 1425 deg. Fahr.; pressure, 13 lb. per sq. in., with whatever wind this pressure will allow. Furnace volume is 15,885 cu. ft.

Ores used are 60 per cent Indian, containing 49 per cent manganese and 5 per cent iron; and 40 per cent Caucasian. Slag contains about 12 per cent Mn and is used in blast furnaces for manganese addition.

The largest furnaces in Luxemburg make about 350 tons a day. Hearth diameter is 16 ft. 5 in. A furnace with 19-ft. 8-in. hearth is now being built at Dillingen and a production of 450 to 500 tons per day is expected from it. This furnace will have skip filling. Some minette ores used have 26 to 28 per cent iron, with enough lime to be self-fluxing. There are also silicious minettes which require lime additions or are mixed with limy minettes.

Tilting Open-Hearth Furnaces Used

The Hamborn open-hearth plant furnishes about 35 per cent of plant steel requirements, the other 65 per cent being basic Bessemer steel. Four 80-ton tilting basic furnaces yield about 100 tons each. Fans are used for blowing the air in, and for drawing out the waste gases. Large checker chambers are used, which take the heat out of the waste gas to about 600 deg. Fahr., so the waste-heat boilers formerly used are now blanked off.

Fuel is mixed by-product and blast furnace gas, averaging one part by-product to two parts blast furnace. No special valves are used, the by-product gas being put into blast furnace gas main in quantity desired, just before checker chambers, so that the mixture is heated.

At Hoentrop is the newest and finest open-hearth plant in Germany. The buildings are high and large, of reinforced concrete and steel construction, as are also the bins for storage of ore, dolomite, etc. There are four basic tilting furnaces, two of 120 tons, one of 180 tons and one of 200 tons capacity. Tilting is done by one 100-hp. electric motor per furnace.

Revolving overhead charging cranes are used, though admittedly slower than floor cranes. Scrap is stored in bins beside the furnace floor, and cranes load it directly into the charging boxes, which sit on a platform opposite each furnace. The whole charge is made up on this platform, so there are no tracks in front of the furnaces. Hot metal is stored in a mixer at one end, and carried to the furnaces by the pit crane, to be poured in at the tap hole.

Exceptionally heavy water-cooled port castings are used. Front walls, as well as back walls, are of magnesite brick and roofs of arched silica brick. They figure that flat suspended roofs are more expensive to install and repair. Three water-cooled pipes between water-cooled door frames serve to hold the front walls in place. Total brick consumption is 17.6 lb. per ton of steel.

Large checker chambers are used, about 23 ft. high, with 2½-in. checker brick and about 4-in. openings. The waste gas is about 850 deg. Fahr., so no boilers are installed. Checkers are heated to 2000 to 2200 deg. Fahr., measured by recording pyrometer with fire end projecting through top of the end wall.

Ladles of 60 to 70-tons are used in the pit, two ladles for small furnaces and three ladles for big furnaces each heat. Charges average 20 per cent pig iron and 80 per cent scrap; the cost of each is about the same. A typical charge on the big furnace is:

7,000 kg. cold pig iron
30,000 kg. hot pig iron
177,000 kg. scrap.

214,000 kg. total, or 214 metric tons

Manganese content of the pig iron is 4 per cent, because the large scrap charge only runs about 0.4 per cent manganese and they want an average of 1.5 per cent in the total charge for good steel. The steel all goes into seamless tubes with 0.40 to 0.48 per cent manganese, so they add some manganese ore in the bath before tapping.

There is a somewhat greater tendency to use tilting furnaces in Europe than in this country, due to some extent to the use of higher-phosphorus materials and the ability to regulate slag conditions more carefully. Such furnaces appear to answer their needs to somewhat greater advantage than the stationary type widely used here. The percentage of pig iron and analyses of materials used here are important factors.

Water-cooling of furnaces is not so widely practised as in America, though the more recently constructed units have made provisions for cooling. The newer units more closely approach American standard practice, the buildings being of heavy type, with ample provision for stocking and charging, and roomy pits and pouring platforms.

Outstanding features noticeable during the visits included a strong tendency to Americanize the plants; especially the blast furnace plants, by following our blast furnace lines, and, in some cases, our methods of construction. In the coke oven plants we saw a number of modern American type ovens, all built with the idea of utilizing all of the rich gas in the steel mills or for public service, and heating the ovens with either blast furnace or producer gas.

[Abstracts of papers by H. J. French on "Steels Required in the Aircraft Industry," and by Dr. W. H. Hatfield on "Rust, Acid and Heat-Resisting Steels," had to be held for printing in a later issue of THE IRON AGE.]

Commerce Year Book, 1928

A wealth of information regarding the physical state of the United States is contained in No. 6 of the series of Commerce Year Books, issued under the auspices of the Department of Commerce, Washington. The volume includes 728 pages of statistically and graphically presented data, with explanatory text, and a 10-page index.

Production, employment and domestic trade occupy the leading position, with prices, foreign trade, agriculture, fuels, construction, metals, machinery, automobiles, rubber, textiles, leather, paper and printing, chemicals, transportation and banking and finance following, in that order.

Intensive study of a work of this sort would give to the reader a detailed knowledge of the resources of the United States and their exploitation that could scarcely be gained in the same amount of time elsewhere. This is Vol. 1, referring to the United States.

See Good Machine Tool Prospects

Outlook Found Promising at Convention for Business, for Further Standards, for Cooperation with Machinery Builders and for Better Trade Practices

MANUFACTURERS of machine tools held a successful meeting, the twenty-seventh annual convention of the National Machine Tool Builders' Association, at Sky Top Lodge, Cresco, Pa., Oct. 23 to 26, inclusive. It was successful from the standpoint of attendance, more individuals representing more companies being present than hitherto. It was successful also in a detail of prime importance—the meetings of the groups making different classes of machine tools, wherein were discussed trade practices, standardization and other topics spelling the advance of the industry.

In the general sessions, the items of chief importance brought before the membership were these: A suggestion that arrangements should be made to bring about a coordination among different groups of machinery manufacturers, to cover matters of common interest, this topic espoused in part by H. B. Kraut, vice-president Giddings & Lewis Machine Tool Co., Fond du Lac, Wis.; an address by H. I. Shepherd, vice-president Guardian Trust Co., Cleveland, pointing out the avenue of desirable relations between the manufacturer and the banker; specific recommendations in respect to standardization as outlined by the association's standards committee; a further discussion on the cooperation among trade associations by Dr. Hugh P. Baker, manager trade association department, Chamber of Commerce of the United States, Washington, and the procedure in machine tool accounting as now in the hands of the association's staff cost consultant, Albert E. Grover.

Industry Is Notably Active

High spots of the achievements of the association and the machine tool industry in the past year were brought out in the annual report of the general manager of the association, Ernest F. DuBrul. These are in part as follows:

The association's index of orders for each month of the last nine has run decidedly higher than for any similar period since the post war boom. In eight months up to Sept. 1 the index indicated a greater business booked than in all of last year. "Just when things are looking the rosiest, we begin to hear that deliveries are being delayed because of lack of skilled labor. So now again, as in the past, when the industry is getting a good run of orders, a short labor supply becomes a factor limiting its production.

"General business is decidedly active, and so far as can reasonably be forecast now, this activity should continue for some months. At this time, when things seem most favorable, it is not pleasant to comment on signs and portents of an unfavorable nature; yet there are such and we should not neglect them. The stock market situation is one factor that probably will react unfavorably on business. It is mere prudence and not pessimism to base our policies on a theory that some sort of slump is not far off, and that it may be somewhat bad. Then if it does not come in the near future, or if it is not bad when it comes, we will be that much more to the good.

"The wise policy is to keep inventories close to demand, and if demand goes down to let inventories also go down. Experience has shown that even with the most careful scheduling the inventory of a machine tool company is a hard thing to control in proportion to a diminishing demand. When you see our index slipping off you can adjust yourselves to the general condition with sure knowledge."

Mr. DuBrul pointed out that group activity is increasing at a very satisfactory rate and that group statistics are increasingly in demand.

In referring to the engagement of Albert E. Grover, as the cost consultant for the members, he said Mr. Grover has a slogan "that is so good that I cannot resist the temptation to give it here. He advances and proves this thesis: 'Effort Expended on Inaccurate Costs is a Complete Loss.'"

Machine Tool Show Next Year

Reporting for the exposition in Cleveland next year, he said that applications for space began coming in as soon as the blanks were sent out on Sept. 15. "In less than three weeks these totaled 80 per cent of the space used last year. In a week more, the applications overran last year's space and before the fifth week passed the applications were 13,000 sq. ft., in excess of what we used last year. This again was without any solicitation. Numbers of our previous exhibitors have applied for more space than they used last year, and many applications have come in from concerns that had not been in last year's show. Everything indicates that our 1929 show will be another tremendous success."

As it looked at the time of the meeting the members of the association will need all of the 60,000 to 65,000 sq. ft. of the main building, while non-members have asked for

some 9000 sq. ft. and 13,000 sq. ft. would be required for accessories, in the event these are admitted to the 1929 show. Decision has not yet been made as to what extra facilities will be taken for the excess demand, such as the 7000 sq. ft. arcade at the exposition building.

New Officers

Henry Buker, vice-president Brown & Sharpe Mfg. Co., Providence, was elected president of the association. H. E. D. Gray, secretary and treasurer of the Landis Tool Co., Waynesboro, Pa., is the new first vice-president, and C. C. Swift, manager of the Ohio Machine Tool Co., Kenton, Ohio, was elected second vice-president. A. H. Tuechter, president Cincinnati Bickford Tool Co., Cincinnati, succeeds E. A. Muller, King Machine Tool Co., Cincinnati, as treasurer.

C. A. Johnson, president Gisholt Machine Co., Madison, Wis.; E. J. Fullam, secretary and treasurer of the Fellows Gear Shaper Co., Springfield, Vt., and F. V. Geier, vice-president and secretary of the Cincinnati Milling Machine Co., Cincinnati, were elected directors for three years, taking the places of P. E. Bliss, the outgoing president; Henry K. Spencer, the retiring first vice-president, and Edward A. Muller.

Six Companies Admitted to Membership

Membership applications of the following companies were acted upon favorably: G. A. Gray Co., Cincinnati; Hall Planetary Co., Philadelphia; Hardinge Brothers, Inc., Chicago; Henry & Wright Mfg. Co., Hartford; Hill-Curtis Co., Kalamazoo, Mich.; and the Product Machine Co., Bridgeport. The Buffalo Forge Co., Buffalo, and the Logansport Machine Co., Logansport, Ind., joined prior to the meeting. Two members were lost in the year, one by liquidation and the other by giving up the manufacture of machine tools.

Would Federate Machinery Makers

WHAT Mr. Kraut used as a text for an informal address on the subject of coordinating machinery manufacturing companies was the development within Germany. He spoke in some detail of the Verein Deutsche Maschinenbau Anstalten, known as the V. D. M. A., which is a federation of 13 associations of machinery manufacturers, including that of the machine tool builders. Incidentally, in the interest of export trade, the association has published a large catalog printed in English. The organization

dates from 1892, when it was established by a few of the larger machinery builders. Today there are 2700 firms identified with the movement, representing 93 per cent of the entire machinery manufacturing companies and employing over 700,000 men, with an annual production in 1926 of 1,250,000,000 gold marks. The potentialities of the case, he pointed out, may be apprehended when it is remembered that there are roughly 6500 machinery builders in the United States, employing 1,800,000 men and producing machinery valued at \$2,000,000,000, and yet the industry as a whole is without a general organization and, as a matter of fact, some of the groups have none or only a loose organization.

These 13 groups in Germany cover, besides machine tool and mechanical tool builders, manufacturers of machinery in the following classifications: textiles, agriculture, locomotives, prime movers, pumps and compressors, etc., conveying machinery, paper, food, crushing, machinery parts, such as certain forgings, and special machinery, including chemical apparatus. Each of these groups has an association, as suggested. The general organization has offices in Berlin under the directorship of Karl Lange. There is an executive board of directors and a general or larger board of directors, and then committees dealing with foreign trade, import duties, raw materials, transport charges, reparations in kind (growing out of the war), bank questions, conditions of sales, exhibitions, cost accounting, accidents, industrial law, insurance, and statistics.

As showing the importance of the German institution, Mr. Kraut said that commercial treaties are negotiated by the German Government only after being considered by the association, and the same action is taken with regard to duties. The general association has a standard form of contract approved by all groups, and covering terms of sales, guarantees and engineering service. Ordinarily, payments on contracts call for one-third cash on ordering and the balance on the basis of a specific understanding, with the time for payment extended for six and sometimes 12 months. In the matter of exports, 50 per cent cash is required on placing the order and the remainder is sometimes not finally payable for 18, and sometimes as long as 24, months. General guarantees do not extend beyond six months from the date of shipment, and the agreements are specific as to the replacement of parts.

Mr. Kraut's talk was regarded as dovetailing into the movement under way among the secretaries of machinery trade associations, which met at Montauk Point, L. I., Sept. 29, to consider uneconomic practices common to makers of machinery and equipment and which group is to hold a second conference in Washington on Nov. 8.

W. S. Hays, secretary of the Power Transmission Association, addressed

the meeting on the same general topic of coordinating relations among trade associations. He would establish an instrumentality of a group of advisory engineers representing the different fields. There are such questions to be aired as the scope and field of applications of leather, rubber and chain belt drives, and of pulleys and the like, the matter of obsolescence and the hunt for new uses of machines and apparatus.

Lathe Makers to Charge for Servicing

As the result of Mr. Kraut's talk, the association voted that a committee of five should be appointed to study the question of a standard form of contract applicable in the case of selling machinery through dealers as well as in the case of direct dealing. In this connection, Col. L. S. Horner, president Niles-Bement-Pond Co., told of the decisions of the committee on engine lathes. The 17 companies represented decided they would stand back of a six months' guarantee but that a charge of \$15 a day and expenses would be demanded of a buyer for assistance in installing, demonstrating or servicing a machine.

A rather general discussion followed and the consensus of opinion seemed to be that special considerations in the case of other classes of machinery made it difficult to accept the rulings of the lathe committee for general application to other groups. In passing, it was emphasized that there was a valuable psychological effect obtained when a machine was shipped with a tag indicating by the inspector's signature that the machine had been duly inspected. It was also held that undue demands were also likely to be checked by having the tag carry a statement of the guarantee clause.

Will Supply Easily Mounted Roller Bearings

Roller bearing design came in for special attention in the report of the association's standardization committee, A. L. Stewart, chairman, and W. L. Miller and S. A. Einstein. The following covers the major items of this meeting's consideration of standards:

It was voted on the proposal of the committee that all projects looking to the standardization of machine tool elements which involve engineering consideration of construction details should be carried through by the group of machine tool builders directly interested and should be worked out within that group before submission to the American Standards Association. The matter of colors for machine tools, being a question very largely of user interest, standardization in this particular, it was voted on the committee's recommendation, was referred to the sectional committee on small tools and machine tool elements operating under the American Standards Association procedure.

The committee reported that a design of roller bearing has been worked out to provide one of cheapened cost

and capable of being mounted as easily as a plain bearing. A large roller bearing company, it appears, has prepared a list of sizes conforming to the existing standard shaft diameters and is prepared to furnish the bearings from stock at prices of standard stock bearings.

In regard to spindle end standardization the committee made the following recommendation which has been approved by the association's board of directors: The different groups affected (lathes, turret lathes, automatic lathes, automatic screw machines, grinding machines, milling machines and drilling machines) should coordinate action by a joint committee having one representative from each group; this joint committee to determine the spindle ends which are applicable to more than one type of machine and to strive to settle on as few spindle end standards as possible.

The committee recommended that the different groups consider test codes to cover the situation arising when users undertake to reject machines as not being sufficiently accurate, such codes to cover methods of testing but not standard tolerances.

Trade Association Work Constructive

A BROAD picture of the place and value of trade associations was drawn by Dr. H. P. Baker, manager of the trade association department of the Chamber of Commerce of the United States, Washington, in an address on "What Trade Associations Mean to Industry."

Tangible benefits, he pointed out, must be based on intangibles, such as good fellowship and confidence, which usually constitute the chief values in the early history of a trade association. If you have developed confidence, you are in a position to go ahead with the tangibles, he said. Among the tangibles discussed were correct cost keeping methods, cooperative research, and simplification and standardization.

In speaking of the promotional work of the new trade association department of the United States Chamber of Commerce, Dr. Baker said, "We want to get across the idea that trade associations are doing sound and constructive work, work that is of value to the consumer as well as to industry."

The "Chicago" plan of appraisal for used machine tools was outlined by E. P. Essley, E. L. Essley Machinery Co., Chicago, at the last session of the convention. J. R. Porter, Marshall & Huschart Machinery Co., Chicago, and president of the Associated Machine Tool Dealers Association, also spoke briefly on the subject, indicating that endorsement of the plan by the machine tool builders would help in extending it to other districts.

That exports of machinery will continue to increase was a belief expressed by W. H. Rastall, chief of the industrial machinery division, Department of Commerce, Washington, in

Officers of the Machine Tool Builders' Association: (from Left to Right) Henry Buker, President; H. E. D. Gray, First Vice-President; C. C. Swift, Second Vice-President; A. H. Tuechter, Treasurer; and E. F. DuBrul, General Manager

speaking on the export situation at the last session of the convention. German influence in foreign markets appears to be weakening and Swiss and English influence increasing, he said.

Machine Tool Cost Accounting Methods Discussed

THAT "effort spent on incorrect costs is a complete loss" was emphasized by Albert E. Grover, staff cost consultant of the National Machine Tool Builders Association, in a paper on "Some Important Points in Machine Tool Cost Accounting," which was presented at the third general session of the convention. Active interest in the cost finding plan proposed by Mr. Grover, which includes production center burden application, was reflected in the discussion of his paper.

It was pointed out that the first consideration of every machine tool builder is profit, and the sources of that profit. "First we arrange the accounting system so that our profit and loss statement will show classes of profit, then segregate the profit accruing from manufacturing and marketing into classes of product, further segregating to individual units where the circumstances warrant."

Use of the current market on materials, labor and burden in figuring costs of current sales was advocated. In this connection Mr. Grover said: "Would it not be better to charge our costs with the market price prevailing when we use the material in manufacturing, and charge the difference between that amount and the actual cost to 'purchasing profit,' provision for which class of profit is made on the profit and loss statement?"

Buildings and equipment, the next two items on the statement, were said to be the differences between depreciation taken into costs on reproduction values and depreciation computed on cost of acquisition. "By

setting up this amount as a profit we are able to charge depreciation on replacement values to production operations through our regular accounts, and at the same time satisfy the rulings of the internal revenue bureau," said Mr. Grover. "In effect we are reporting depreciation on cost values. We are also displaying to our officers, monthly, advantages in profit due to having purchased buildings and equipment below the market of today.

"Here again, is it not better to charge our costs with the present value of the utility we are consuming for the consumer's benefit, and show the difference between that amount and the acquisition cost as a purchasing profit, which it really is?"

It was held that the cost of maintaining excess capacity is not a proper charge to operating expense; including it in the burden application will increase the cost figures. "Competitors who do not have expense of excess capacity naturally have no such item to reckon with," he said. "Showing this segregation on the monthly statement, of loss due to excess capacity, often spurs the organization to more effective sales activities."

Production Center Burden Application Advocated

In the plan of distributing costs shown by Mr. Grover, burden is charged to manufacturing cost on the basis of normal operating hours of production centers through which the individual parts and assemblies flow. "Only plants manufacturing one article and one size of that article can secure accurate costs of finished product by distributing manufacturing burden on the basis of the direct labor or direct labor hours represented in each article," he said. "However, that result would be an unsound basis on which to establish a selling price if the cost of any excess capacity is included in the burden rate calculations."

In the general plan of burden application advocated, the plant is divided into departments, including in each department only such area and equipment as required to perform one class of work.

The burden cost of each department is divided into three classes, representing the bases of distribution necessary to state correctly the cost of operations on the product. These classes are: 1, Buildings, a place for the man to work; 2, equipment, tools for the man to work with; and 3, general supervision and clerical effort necessary to plan and record their activities; also supplies and other expenses in maintaining working conditions in the departments.

Building Expense Distributed to Production Centers

Building expense consists of depreciation, taxes, insurance, interest on investment in and repairs to buildings; also lighting and heating. The total cost of furnishing a place for the men to work is distributed to production centers on the basis of the area occupied by each.

Equipment expense consists of depreciation, taxes, insurance, interest on investment in and repairs to machinery and tools; also power. Depreciation, taxes, insurance and interest on investment are allocated to production centers on the basis of the reproduction values of machinery and tools. Repair costs, both material and labor, are charged directly to production centers.

General expense consists of supervision, taxes, insurance, interest, supplies, indirect labor, office salaries, etc. Taxes, insurance and interest cover fixed expenses on investment in inventories. Indirect labor does not include supervision and office salaries. All general manufacturing expenses are distributed direct to production centers.

The sum of building, equipment and general burden applications to each

production center, divided by the normal operating hours of the center, will result in a rate of burden that is practical to use in cost and estimate calculations.

Methods that do not comprehend the basis of distribution outlined in the paper were said to be faulty, and dangerous to the effective use of costs in establishing sales policies.

Comparisons of the results obtained by various methods of burden distribution formed an illuminating part of Mr. Grover's paper. Distribution

of burden on the basis of direct labor was said to have all the irregularities of the blanket production-hour method, with the wages paid to machine operators added. "There is absolutely no relation between operator's compensation and the cost of running the machine," he said. "Of all the inaccurate methods of burden distribution this method is the most unreliable."

Urges Budgeting One's Business

The address of the banker, H. I. Shepherd, emphasized that "we are

coming into what may be termed a period of glorification of the properly analyzed financial statement, showing the history of business operation recorded in the usual control figures." The ability to budget or to forecast operation in business, he urged, begets confidence. It begets confidence on the part of the management of the business itself and on the part of the banker who is called upon to extend a credit which must rely for its security and its ultimate liquidation upon performance in business.

New Planer-Type Milling Machine

Arrangement of Heads, Each of Which Is a Complete Power Unit, Separate Motors for Feeds, Motor Controls and Interlocks Are Features

PLANER-TYPE milling machines in a variety of sizes are being placed on the market by William Sellers & Co., Inc., Philadelphia. The machine illustrated will take work 64 in. wide between the cutters on the side heads and 60 in. high between the table and the cutters on the cross-rail heads. It will mill work 20 ft. long. Bed, table, uprights and cross-rail are of massive construction to provide a rigid support for work and cutters. The machine is not an adaptation from planer design, but is made from entirely new patterns and is designed to resist the particular strains encountered in milling.

An outstanding feature is the design of the heads. The heads on the cross-rail and those on the upright are identical except for being right and left-hand. Each head is a complete power unit having its own 20-hp. motor drive. This arrangement requires only short shafts and spur gears in the drive and eliminates long splined shafts, bevel gears and worms. All gears in the heads are of chrome-nickel steel, hardened. Shafts are also of chrome-nickel steel and are carried in ball or roller bearings, with the exception of the spindle. The

spindle quill is 11 in. in diameter and has a 14-in. stroke in and out by power or by hand. The spindle,

Each Head Is a Complete Power Unit. Those on the cross-rail and on the uprights are identical except for being right and left-hand. The spindle quill is 11 in. in diameter and has a 14-in. stroke in and out by power or by hand.

made from a chrome-nickel steel forging, is 6 in. in diameter at the small end of the tapered front bearing. At slow speed it is driven by a 16-in. diameter gear through multiple splines milled in the spindle.

Feeding of Heads and Table Is by Independent Motors

Feeding of the heads is by independent motor and speed reducing box, which includes one change of gears, the motor and box being located at the right-hand side of the upright. All feeds from 1 to 4 in. or 4 to 16 in. are controlled by a field rheostat, so that small variations in amount of feed may be obtained.

Each head is provided with a stainless steel scale graduated in thirty-seconds of an inch. An adjustable pointer moves with the spindle and measurements may be read accurately on the scale. For closer readings, an indicator may be made to move with the quill and by contact with a block located on a pad on the head, thousandths of an inch or less may be measured. The table is provided with stainless steel scale and adjustable vernier allowing readings to sixty-fourths.

Table feeds, provided by an independent motor and gear unit, range from 1 to 16 in. per min. Rapid traverse is at 20 ft. per min. Variations in

table feed are also controlled by field rheostat and one gear change.

Use of separate motors for the feeds is emphasized as of marked advantage in milling irregular shapes, in that one feed may be employed without interfering with the other, and any combination may be used to give any angle of cut required. In milling the edge of irregular castings, such as turbine housings, the operator can vary the feeds to follow around the oval shape by the use of field rheostats and push-button stations, without moving from the operating position.

Power traverse for the heads and quills is provided by an auxiliary motor on top of the machine. Here again the machine is arranged for convenience, as one head may be traversed while another is being fed. This motor also raises and lowers the cross-rail. In mounting the motor half way between the two uprights the shaft running to each lifting screw is of the same length, which arrangement is

side cuts. The table is driven by spiral pinion and rack, through herringbone gears from a change gear box. End thrust on the driving shaft is taken on ball bearings which may be adjusted conveniently from outside the bed. Oil is continually circulating through these bearings.

The bed is of closed-top type and is heavily reinforced between uprights. Inside the bed are located the tanks

The Cross - Rail Slides On the Face of the Column and Has a Bearing on a Vee at the Back. The clamp is operated by a single lever at the right-hand end of the cross-rail. Power traverse for the heads and quills is by means of the auxiliary motor at the top of the machine

Feeding of the Heads Is Through an Independent Motor and Speed Reducing Box. Table feeds are provided by another independent motor and gear unit. All motors are controlled from one panel and operated by push buttons at each side of the table

Interlocks are provided for the various motions; the feed motors, for instance, cannot be started in advance of the cutter motors. If a 30 per cent overload occurs on any one of the cutter motors, the feed motors will slow down until the load is lessened, when they will automatically speed up again. If a 50 per cent overload occurs on any one cutter motor the overload relay will stop it and the feed motors

intended to assure steady and accurate lift.

The cross-rail is of the box type with the back extended between the uprights, a construction that has been used for many years on Sellers boring mills and planers. The cross-rail slides not only on the face of the uprights but has a bearing on a vee at the back. A powerful clamp that may be operated by a single lever at the end of the cross-rail is provided.

The table, of deep box construction, is carried on one flat and one double-vee way. The double-vee construction, which is said to maintain accuracy under the heaviest side cuts, consists of a flat vee combined with a vee with walls inclined a very few degrees from the vertical. The table bears on the flat vee except in cases of excessive side pressure, when the upper vee holds the table in place. When there is no side thrust the upper vee clears by a few thousandths of an inch. Hold-down shoes are provided to keep the work table from lifting on the heavy

and pumps with their motors, a feature which eliminates piping that might be an obstruction and detract from the appearance of the machine.

Lubrication of the machine has been carefully worked out. Each head has its own pump and circulating system, and a pump is provided in the feed gear box to assure adequate lubrication of all bearings and gears.

Lubrication of the table ways is by force feed. The pump is driven by a separate motor and the arrangement is such that the pump must be started before the table feed motor can be started. This pump also assures continuous flow of oil through the spiral pinion box and the driving shaft bearings.

All motors are controlled from one panel and are operated by push buttons located at each side of the table.

will stop instantly. Other interlocks, as well as safety clutches, are provided to make the machine as "fool-proof" as possible.

Provision is made for cutting compound. The tank is located in the bed and has a gage glass on the outside. The pump, driven by a 1-hp. motor forces the liquid through the pipes in the uprights to the top of the machine, from which it is piped to each of the heads. An adjustable frame and two nozzles are provided for each cutter.

Machinery Merger to Involve Five Companies

The Foote Brothers Gear & Machine Co., Chicago, practically has completed negotiations for the acquisition of four other companies engaged in machinery manufacturing. Definite announcement of the details of the merger may be made in 30 to 60 days.

The General American Tank Car Corporation has announced plans for the formation of a European subsidiary to operate a fleet of railroad freight cars throughout Continental Europe.

New Sand Machine Makes Many Tests

A UNIVERSAL sand testing machine for measuring the green and dry bond strength of molding sand, cores, core pastes and clays has been brought out by Harry W. Dietert, Detroit. The machine can be operated by the standard American Foundrymen's Association compres-

Bond Strength of Molding and Core Sands and Other Materials Can Be Determined

sion method or by the shear control method.

The machine consists of three major parts—a substantial base, on which is mounted a pendulum weight, and a pusher arm. The pendulum weight swings on self-aligning ball

bearings, mounted on a carbon steel shaft to which the pusher arm is keyed. Various testing heads may be slipped into place on the pusher arm to make different bond tests. When testing in green bond the test head is placed in the lower hole of the pusher arm, this position giving a sensitive test to detect small changes in the bond. For the high reading dry bond test, the test head is placed in the upper hole of the pusher arm where a great breaking force is obtained.

The bond test is made by placing an A. F. A. permeability sand specimen between the test head of the pusher arm and the weight. By turning the hand wheel, the pusher arm is moved up causing the sand specimen to raise the weight. The stronger the sand the higher it will raise the weight. A rider on the scale shows the maximum height that the weight is raised. The strength of the sand in pounds is read directly from the scale, which has divisions far apart, making it easy to read in 0.2 lb., and to 0.02 lb. by interpolation.

As the machine is a dead-weight testing machine, it will stay in calibration indefinitely. Testing attachments may be provided for making the A. F. A. tensile core test, shear test, Mackin clay bond test, flexure core test and core paste tests. The testing capacity is green compression, 11 lb.; dry compression, 55 lb.; control green shear, 9 lb.; control dry shear, 45 lb.; A. F. A. tensile core, 160 lb.; Mackin clay bond and core pastes, 45 lb. The machine is 20 in. high, has a 8 x 20-in. base and weighs 134 lb.

Combination Testing and Lapping Machine

THE Gleason Works, Rochester, N. Y., has brought out the 18-in. combination testing and lapping machine, illustrated, which is intended for use in the production of spiral bevel and hypoid gears. The gears are first tested after cutting, to show the proper tooth bearing, and then after hardening, for bearing and for noise. A brake on the gear or on driven head enables the operator to test them under load.

In lapping a pair of spiral bevel or hypoid gears the usual practice is to vary the settings so as to secure lapping all over the surface of the teeth. The design on which the machine illustrated is based is such that any adjustment or motion will be not in a horizontal or vertical direction only, but a combination of the two in proper proportions, so that the motion follows the tooth curve already generated. In this machine this motion is automatic and can be changed in direction to suit any job that may be put on the machine.

Gears up to 18 in. pitch diameter may be lapped on the machine. The maximum offset obtainable when testing hypoid gears is 3½ in. The maximum distance from the center of the

gear spindle to the nose of the pinion spindle is 12 in. and the minimum

distance is 3¾ in. For lapping operations, guards, a self-contained pump unit, and reservoir for the lapping compound are furnished. The standard spindles on which the work is mounted are ground 2.292 in. at the large end with ½ in. taper per foot, but special pinion heads with larger size bores can be furnished.

The machine is built to high standards of precision. The taper holes in the nose of the spindle are ground with the spindles in place in their own bearings to assure concentricity between the spindle bearings and bore. All bearing ways have ample area and narrow guides to maintain close alinement. The nose of the spindle is heat treated and the spindle is mounted on an improved type of matched ball bearings. These bearings are prepared and mounted under sufficient initial load so that there is no evidence of radial or axial deflection of the spindle under ordinary operating conditions. They are tested for quietness and are required to be so nearly silent that the operator has no difficulty in detecting gear noise. Labyrinth construction seals are provided to protect the bearings. There are sight oilers for convenience in maintaining the proper oil level and the lubricating oil is filtered before it reaches the bearings.

The drive spindle, which is power driven, can be run in either direction. It is provided with a lock for use when tightening and loosening the arbor nuts. The driven spindle has a wooden lined friction brake for testing gears under load. The taper in the standard spindle is the same as in the 15 in. and 10 in. spiral bevel gear generators the arbors of which will fit the testing machine.

The pinion spindle head and the gear head column are adjustable horizontally on the frame by means of hand wheels which are graduated in 0.001 in. The drive head, or pinion head, and the column upon which the gear head is mounted are clamped to the frame at front and rear by separate clamps which operate with equal tension from a single lever. The ways are square gibbed. Guards are provided over the ways to protect them from dust and red lead.

A 5-hp., 1800-r.p.m. motor is recommended for the main drive and is set in the base of the machine.

Gears Up to 18-In. Pitch Diameter Can Be Lapped

Speed Reducers with Sykes Herringbone Gears

THE Farrel-Birmingham Co., Buffalo, has announced a new series of speed reducers having Sykes contin-

the plain bearing units since in all cases the same oil may be used for gears and bearings and the splash

The Rolling Mill Unit Is at the Left and the Double-Reduction Unit, for Ratios from 10 to 1 and 60 to 1, Is Shown Below

uous tooth herringbone gears and anti-friction bearings.

The roller bearings being of the type which combine journal and thrust capacity, both pinion and gear shafts are held from end float and are therefore protected from abuse from connected mechanism. It is claimed that this type of mounting is practicable with the Sykes gear since the apices of the teeth are central in the face of the gears around the entire periphery, and no end float either of gear or pinion is necessary.

High mechanical efficiency, 98½ to 99 per cent for a single reduction and 98 to 98½ per cent for a double reduction, is also claimed. The lubrication is said to be simpler than with

and flood automatic system of lubrication is possible throughout the whole series. There is a considerable saving in space in the new design.

One illustration herewith is of a double-reduction unit suitable for ratios from 10 to 1 and 60 to 1, and powers between 5 and 200 hp. A typical outboard mounting where generated straight tooth gears are used for the final reduction is also shown.

A rolling mill unit suitable for powers between 300 and 500 hp. is also illustrated. The bearings are held in sleeves to facilitate adjustment and allow for shaft expansion. The case is of box section girder design extending from the center line of the shafts to the base.

New Die Head for Use on Screw Machines

THE Landis Machine Co., Waynesboro, Pa., has brought out a new die head, named the Landex, for use on automatic screw machines.

This head, of rotary pull-off type, is opened by retarding the forward movement of the die head or die holder and is closed automatically by an attachment on the automatic screw machine. It is of carbon steel and is heat-treated throughout, and ground. The head is flexible on its shank to compensate for any misalignment in the machine or in the work to be threaded. In being supported on the front face of the head, the chasers are accessible for removal. The Landis "long life" chaser is employed.

A worm employed for adjusting the head to size is kept under the proper turning tension at all times, thereby eliminating the necessity of locking it for each adjustment for size. A micrometer dial is provided for further adjustments to suit close or free fits. The die head is locked within itself under service conditions

by the engagement of two hardened closing pins and closing pin bushings. The spring for opening the head is located in the adjusting ring and has a uniform tension for all diameters.

The heads are made in the ½, 13/16 and 1½-in. sizes and are graduated for bolt and pipe threads within their ranges. Each graduation is separate, and has its own index mark on

the operating ring. All passages and openings into the interior of the head are covered under service conditions to prevent entrance of dirt and chips.

Introduces a Steel-Side Press

THE adoption of forged steel side-frames for the new Chambersburg trimming press aims at the practical elimination of side frame breakage as a hazard of press operation. The press now comprises strong I-section forgings with a heavy semi-steel bed frame and yoke, an oversized crank, outboard bearings used on all shafts, and a patented friction slip flywheel.

The friction slip flywheel serves to eliminate the hazard of the flywheel bursting, or the crank or gears being broken when an overload stalls the press. The energy developed by a sudden stop of the machine instead of expending itself as a strain on

The New Chambersburg Press Has a Steel Side and Friction Slip Flywheel

all moving parts is released by the flywheel slipping on its hub against friction. Adjustments to the press are rarely necessary after slipping.

Other new features of this press are: Roller bearings on auxiliary shafts; directly renewable clutch jaws and cam (emphasized as a time saver on this most frequent of renewal jobs); a pitman adjustment that grips the threads over the length of the screw; high pressure grease lubrication to all bearings and surfaces; reduced floor space requirements and free accessibility from the rear.

This press comes with either single or double crank construction, and is built by the Chambersburg Engineering Co., Chambersburg, Pa.

Business Analysis and Forecast

Large Business Volume Will Continue

Sidewise Movement of P-V Line Indicates Stable Conditions—Too Much Reliance on Automobile Industry as Key to Demand

BY DR. LEWIS H. HANEY

DIRECTOR, NEW YORK UNIVERSITY BUREAU OF BUSINESS RESEARCH

ONE outstanding point in the present business situation is the strong contrast between the position of the automobile, machine and metal industries with that of many other industries. Led by the automobile and farm machinery manufacturers, steel, copper, electrical appliances and machine tools show high activity and have continued to expand rapidly until very recently, at least. On the other hand, textiles, leather, shoes, paper, railroad equipment, building materials and coal are backward, and these industries are either operating at a low level or declining. The net result is that, while indexes of production that do not include building materials and many miscellaneous industries rise to new peaks, broader indexes of business activity, not arbitrarily weighted, either

decline or remain about stable at relatively low levels.

Such indexes are those of factory employment and railroad freight tonnage. Both were lower in September than they were a year ago. This suggests the possibility that our prosperity, great as it is in a number of basic industries, is not so uniformly distributed as is desirable. This may indicate a lack of balance.

Something of this was in mind last month when we suggested that the present industrial situation is dangerously dependent on the automobile industry. It will be noted that the sales of the General Motors Corporation fell off considerably more than usual in September. The Ford output has passed Chevrolet production and suggests the possibility of disturbing competition in the low-priced automomobile field.

Growing automobile exports are a saving factor, but it is undesirable to have so much of our prosperity dependent upon any one industry.

Outlook for Business Is Excellent

For the present, however, the automobile, machinery, steel and copper industries are thriving and the upward trend of machine tool orders is a favorable omen. Building activity is still large, due to the heavy contracts of the past few months. Retail trade in general merchandise and in automobiles is active. The effects of high money rates and low yields on invested capital, in the way of restricting the flow of capital into industry, are not yet pronounced. Any maladjustments that exist are not serious or critical—except in the case

Factors in the General Business Outlook

Favorable Factors

- (1) *The P-V line is stable at a rather high level, indicating demand and supply in fair balance, on the average.*
- (2) *Retail trade is active and gained in September; wholesale trade improved.*
- (3) *Automobile production and sales well maintained at high levels, considering the season.*
- (4) *Money easier; gold imports check advances.*
- (5) *Machine tool orders expand.*
- (6) *Financial position of most leading companies strong.*
- (7) *Stocks of commodities moderate in most industries; mercantile inventories light.*
- (8) *Political uncertainties largely removed.*

Unfavorable Factors

- (1) *Trend of building activity is downward; permits and contemplated new construction are low.*
- (2) *Money continues relatively tight, restricting new bond issues.*
- (3) *Commodity price trend turns downward.*
- (4) *Farm situation is less favorable than supposed; decline in livestock prices.*
- (5) *Trend of exports is downward.*
- (6) *Wild speculation on the stock exchange and excessive brokers' loans take an undue share of the nation's capital and attention.*
- (7) *Business failures are numerous.*
- (8) *Railroad freight traffic and gross revenue are relatively low, also factory employment, indicating that total business activity is probably not up to that of a few leading industries, and is thus not well balanced.*

of the stock market. Money is even a little easier. The decline in commodity prices during the past few weeks has been moderate and does not seem likely to become a seriously disturbing factor.

In short, in spite of some unfavorable possibilities and great excesses in speculation, the outlook for business indicates a stable and well sustained volume during the winter

months, with earnings fair to good in a majority of industries.

Demand Adequate to Absorb Output

THE trend of the P-V line is about sidewise, at a level considerably above normal. The action of this general business barometer means that the demand for commodities is ade-

quate to absorb the quantities supplied at current prices. Of course, this applies to average conditions.

As usual, a fairly close relation exists between the trend of steel production and this barometer. As adjusted to eliminate the merely seasonal ups and downs from month to month, the underlying trend of steel ingot production was downward in May and June, then upward in July,

Sidewise Movement of P-V Line (Ratio of Commodity Prices to Physical Volume of Trade) Indicates Stable Business Conditions and Large Volume. Steel production (adjusted) continues high

Unfilled Orders Are Moving Narrowly About the Axis; Stock Prices Are Making New High Records and Scrap Prices Are Considerably Better

Bank Debits Are Inordinately High, Reflecting a Huge Volume of Speculation. Railroad tonnage, on the other hand, is at the lowest level, for the season, since 1924

since when the trend has been irregularly sidewise. There is no indication of a more than seasonal decline.

Steel Orders Gained Little on Shipments

WITH reference to the second chart, at least two points are clear: (1) Steel scrap prices have advanced sharply and the market is strong at this writing; (2) the average price of steel stocks has risen further and made successive new highs in September and October. The trend of scrap prices has been a bet-

expansion in the chain store business. Neither accurately measures the true volume of business. But, after making all allowances, it may be said that both indicate that trade is active and relatively high, in comparison with industrial production.

Two other curves are low—wholesale trade and railroad freight traffic. Both are below a year ago, but show some recovery at the end. These indexes reflect the fact that the true total volume of business and industry is only moderately large, and make

est point since December, 1925, exceeding even the 1923 peak. The trend is still upward and the output in terms of value does not seem excessive, even in comparison with department store sales (which are now our only reliable indicator of retail trade).

So long as the total value of production increases along with the quantity of production, the industrial situ-

Retail Trade Continues to Show Heavy Gains, Which Are Attributed Largely to Chain-Store Business. Wholesale trade remains slow, while industrial production is progressing at the highest levels in three years

ter barometer this fall than the unfilled orders have been.

Unfilled orders of the Steel Corporation gained by only about the usual seasonal percentage in September, and accordingly the rate-of-change line in the chart moved sidewise and was only slightly above the base line. A three-month moving average would show a decline. In short, steel orders gained little on shipments, and this would usually indicate that no considerable expansion is to be expected; but speculation, both in scrap and in the stock markets, continues to run values up. In both cases the unfavorable reaction is only a matter of a little time.

Divergent Tendencies Shown

CONDITIONS illustrated in the third and fourth charts may be discussed together.

It will be noted that two curves are high—bank debits and retail trade. The former reflects an enormous volume of speculation on the stock exchanges; the latter, an extraordinary

the high rate of speculation and buying of luxuries seem excessive.

In between these extremes lies the estimated value of the industrial output. In August, this rose to the high-

ation may be called strong. Not until commodity prices cease to keep pace with increased output, and the P-V line declines, will a recession be forecast.

Steel Furniture Orders Well Ahead of Last Year

WASHINGTON, Oct. 30.—Orders for steel furniture in the "business group" in September were valued at \$2,689,009, against \$2,619,230 in August, and \$2,367,857 a year ago, according to reports received by the Department of Commerce from 34 manufacturers. Orders for shelving furniture were valued at \$799,850 and \$863,420 respectively, in 1928, and \$607,905 a year ago, according to reports received from 16 producers.

Shipments of business furniture in September were valued at \$2,754,135, compared with \$2,564,633 in August, while unfilled orders at the end of

September were valued at \$2,061,856, a decrease of \$56,562 from unfilled orders at the end of August. Orders for business furniture during the nine months ended with September were valued at \$26,494,877, an increase of \$3,371,630 or 14½ per cent over the corresponding period of last year.

Shipments of shelving furniture in September were valued at \$678,422, compared with \$836,104, while unfilled orders at the end of September and August were valued at \$753,813 and \$734,365 respectively. Orders for shelving furniture during the nine months ended with September were valued at \$6,938,395, a gain of \$1,324,571 or 23½ per cent over the corresponding period of 1927.

Schedule of the next instalments of the Business Analysis and Forecast, by Dr. Lewis H. Haney, Director New York University Bureau of Business Research, follows: Nov. 15—Position of Iron and Steel Producers; Nov. 29—Activity in Steel Consuming Industries.

Large Export Movement Continues

September Total One-Fifth Below August,
But 39 Per Cent Above Last Year—
Imports Off One-Sixth

WASHINGTON, Oct. 29.—Making a decline of 59,241 gross tons, exports of iron and steel from the United States in September aggregated 228,056 tons, against 287,297 tons in August, which was the highest monthly outgoing movement since February, 1921, with a total of 393,329 tons. For the nine months ended September, 1928, exports amounted to 2,127,431 tons, an increase of 461,567 tons or 27.7 per cent over those for the corresponding period of last year with a total of 1,665,864 tons. The nine-month total of 1928 was but 55,760 tons less than the total for the entire year of 1927.

Imports in September, amounting to 57,782 tons, dropped 12,132 tons from those for August, with a total of 69,914 tons. Incoming shipments during the nine months ended with September, totaling 565,421 tons, reflected a decline of 5992 tons from the imports of 571,413 tons for the corresponding nine months of 1927.

The sharpest decline in exports during September when compared with August was in boiler tubes and welded pipe, which registered a drop of 13,957 tons from 30,948 tons in August. The second heaviest falling off in September exports was in scrap, which dropped 12,027 tons from 70,533 tons in August, the latter being the largest monthly export movement of old material on record. Scrap exports for the nine months of the current year, with a total of 423,287 tons, far exceeded such shipments for the corresponding period of last year, with a total of 175,824 tons. As in August, exports of scrap constituted the largest single item of outgoing shipments in September.

Average daily exports in September were 7602 tons, against 9260 tons in August, while the average monthly shipments for nine months were 236,381 tons in 1928, compared with 185,096 tons last year.

Most of the scrap exports in Sep-

tember went to Canada, which took 44,092 tons. Japan, taking 11,279 tons, was the heaviest overseas consumer. Exports of this commodity to Italy amounted to 1765 tons.

Of the 6721 tons of casing and oil line pipe exported in September, 3053 tons went to Venezuela, 1345 tons to Java and Madura and 732 tons to Canada. Colombia took 1140 tons of the 5403 tons of welded black pipe exports in September; Japan, 944 tons; the United Kingdom, 841 tons; Canada, 595 tons. Canada was the recipient of 14,015 tons of the 14,298 tons of skelp exported during the month, and also of 3004 tons of the 3290 tons of hoops and bands.

Taking 6888 tons, Japan was the leading purchaser of the 16,471 tons of tin plate in September; Canada took 4344 tons. During the nine months ended with September, Canada took 38,107 tons of tin plate, against 35,225 tons in the corresponding period of last year; but Japan led

in both instances, taking 42,403 tons and 40,692 tons respectively. Peru took 962 tons of American tin plate in September.

Steel bar exports in September included 9392 tons to Canada. For the nine months, Canada took 71,737 tons, compared with 48,513 tons during the corresponding period of last year. Exports of plain structural material to Canada in September were 10,661 tons. For the nine months shipments of this material to Canada aggregated 109,345 tons, against 87,176 tons for the corresponding period of last year. Canada also was the principal buyer of steel rails, galvanized sheets, black steel sheets, plates and plain and galvanized wire in September and during the nine months.

Total exports to Canada during September were 126,102 tons, while for the nine months they were 854,620 tons, compared with 631,640 tons during the corresponding period of last year. Exports to Japan and

Chosen in September were 36,376 tons, and for the nine months ended with September they were 298,019 tons, against 206,826 tons for the corresponding period of last year.

Aggregating 12,207 tons, imports

of structural shapes constituted the principal item of incoming shipments in September, 6988 tons being furnished by Belgium, 3369 tons by Germany and 1377 tons by France. Of the 7358 tons of steel bars imported in September, 4391 tons came from Belgium, 1157 tons from France, 833 tons from Germany and 774 tons from Sweden. Germany supplied 1213 tons of the 3084 tons of "other pipe and tubes" imported in September, while 911 tons came from the United Kingdom, 261 tons from Canada, 245 tons from Czechoslovakia and 146 tons from Belgium.

Of the 15,063 tons of manganese ore concentrates imported in September, 4768 tons came from British West Africa, 4232 tons from Soviet Russia, 3780 tons from India and 2162 tons from Brazil. Norway supplied 3092 tons of the 4660 tons of ferro-manganese imported in September; Canada, 1047 tons; United Kingdom, 462 tons.

Sharp Decline in Machinery Exports

September 25 Per Cent Below August, But Nine Months 12 Per Cent Ahead of 1927—Imports Lower

WASHINGTON, Oct. 29.—Declining \$11,389,853, exports of machinery of all kinds in September were valued at \$32,913,382, against \$44,303,235 in

August. The decrease was reflected in most of the items, locomotives being one of the few exceptions. In September of last year exports of

machinery were valued at \$34,309,930. For the nine months ended September, however, a substantial increase over exports of the corre-

sponding period of last year was made, being \$365,323,328 as compared with \$327,272,896.

Exports of industrial machinery in September were valued at \$14,872,197, against \$19,173,465 in August and \$14,307,188 in September of last year. For the nine months ended with September they were valued at \$164,361,944, compared with \$150,425,125 for the corresponding period of last year. Exports of power-driven metal-working machinery in September were valued at \$1,660,115, against \$2,650,532 in August and \$1,554,950 in September, 1927. For the nine months ended with September, 1928, the present and last year, exports were valued at \$19,017,249 and \$13,747,990 respectively. Exports of agricultural implements and vehicles in September were valued at \$8,498,000, against \$13,697,000 in August. Exports of power-driven metal-working machines listed in

THE IRON AGE table totaled 553 in number, valued at \$835,866, in September against 833, valued at \$1,712,938, in August.

Imports of machinery and vehicles in September were valued at \$2,226,391, compared with \$2,729,543 in August and \$2,198,617 in September of last year. For the nine-month periods the values were \$21,194,752 in 1928 and \$21,103,263 in 1927, a difference of only \$91,489. Imports of industrial, office and printing machinery in September were valued at \$1,428,520, against \$1,829,834 in August and \$1,370,674 in September of last year. In the nine months of 1928 and 1927 they were valued at \$13,205,462 and \$12,697,399 respectively.

Imports of machinery as listed in THE IRON AGE table were valued at \$1,499,728 in September, against \$2,081,751 in August and \$1,347,986 in September of last year.

loft under the roof, a scaffolding was prepared for the erectors, but this was found unnecessary as the workmen were able to work quite rapidly by climbing up the lattice-like work as they bolted it ahead of them.

In spans of 30 to 60 ft., the rhomboid roof weighs about 2¼ lb. per sq. ft. and the standardized units in 5-ft. and 10-ft. lengths are of a broad U shape 5½ in. between the two 2¼-in. flanges. These units weigh about 2½ lb. per ft. It is suggested by the designer that on larger spans somewhat larger dimensions and heavier gage sheets could be used. As yet no standardization of various weights for different designs has been attempted.

These roofs are being sold in Germany for barns and other agricultural purposes, but they are suggested as a desirable method of constructing aircraft hangars, large arenas and convention halls. The selling price in Germany is at present about 25c. per sq. ft. and the cost of manufacturing, including galvanizing, is placed at about \$125 per metric ton, f.o.b. works.

This type of construction is claimed by its producers to weigh about 40 per cent less than the usual roofing, and loading tests made by the German manufacturers are said to show that the roof will carry double the load of a regular design.

German Develops Steel Lattice Roof

American Company Has License to Use Pressed Steel Channels, Bolted Together, for Arenas, Public Halls, Etc.

LICENSE to manufacture pressed steel channels for a new type of roof structure developed in Germany has been acquired by the Blaw-Knox Co., Pittsburgh. Patented by Emil Moritz Huennebeck, it is known as rhomboid trussless roof construction. Since its development it has been manufactured in Germany by the Rautennetz-Gesellschaft M.B.H., Duesseldorf. As indicated in the accompanying reproduced photographs, the materials used throughout consist of pressed metal channels. They are of two standard lengths, one 5 ft. and the other 10 ft., pressed from No. 14 gage sheets, which are later galvanized.

The web of the longer channel is cut away at each end, leaving an overhang of about 5 in. on one flange and 6 in. on the opposite flange at each end. Two countersunk holes for bolts are punched in each flange and the ends are sprung sufficiently to admit the abutting channel, to which it is

bolted. The shorter piece has a slit close to one flange and substantially parallel with it, the slit to admit the overhanging flanges of the 10-ft. channel. The cut is shaped to permit the countersunk bolt holes in these flanges to pass.

In erecting the first experimental building, which was a barn with stables on the first floor and a large

The upper group of sample sections consists of a part of a 10-ft. channel, showing one of the two slits through which a flange at the end of another 10-ft. channel may be inserted. In the foreground are ends of a 10-ft. channel and a 5-ft. channel. In the lower group these sample sections are bolted together as in a roof

This experimental barn constructed in Germany as one of the buildings in an all steel farm exhibition, shows the completed rhomboid roof ready for the sheets or other outside covering. Similar construction on a larger scale is suggested for aircraft hangars, large arenas, or factory buildings

mobile and there is the expectation that this amount will be increased to 40 to 60 lb., as the Ford company has sent out blueprints covering 12 to 15 parts to both malleable foundries and drop forge plants for estimates. In the old model T Ford there were 90 lb. of malleable castings, which was reduced to 74 lb. about two years ago when the hubs were changed from castings to forgings. In the new model A forgings replaced malleable castings until quite recently. It is understood that Ford production has been delayed by inability to get desired deliveries on drop forgings.

European Steel Business Less Active

Buying Smaller Since Decline of Prices from Peak—French Expect Home Construction to Continue Through Winter

(By Cable)

LONDON, ENGLAND, Oct. 29.

PIG iron is quiet, but Cleveland producers expect to book further substantial tonnages before the end of the year. Consumers, however, are limiting their purchases to immediate requirements. Export demand is poor, but the threatened German lockout in November may bring improvement.

Hematite is still moderately active in the domestic market and Italian consumers are buying special grades. Foreign ore continues quiet.

Finished iron and steel markets are quiet generally. Although there is some export demand for heavy steel, sales are small. Rail and sheet mills are moderately busy.

Swan, Hunter & Wigham Richardson, Ltd., have a contract for a 15,000-ton floating oil factory to cost £275,000 (\$1,336,500) from the Viking Whaling Co. Clyde shipyard joiners have ceased working overtime as a protest at the refusal of employers to in-

crease wages by 5s. (83c.) per week.

Tin plate is quiet and prices are easier with makers seeking to book orders for shipment over the remainder of the year. Prompt and early shipment tin plate has sold at 18s. (\$4.37) per base box, but for delivery next year the price has been 18s. 1½d. (\$4.40) per base box, f.o.b. works port.

Galvanized sheets are steady, with a fair trade in small orders. Some mills are sold out until January, but others need tonnage for November shipment. Japan is buying a few small lots of light and heavy-gage black sheets.

Continental iron and steel markets are quiet, with prices steady following the recent decline. German production in September, was 985,000 metric tons of pig iron, 1,190,000 tons of steel ingots and cast steel and 941,000 tons of rolled steel products. Italian output in the first half of this year was 204,000 metric tons of pig iron and 892,000 tons of steel ingots.

ally paid. It has been pointed out to the correspondent of THE IRON AGE in Germany, by the United Steel Works, Düsseldorf, and by the Federation of German Steel Manufacturers, that, while German wages are generally considered to be much lower than British, they are in most cases higher, both actually and relatively.

Actual wage payments to workmen are higher than a table of wage rates would show, as practically all steel workers are receiving the 25 per cent bonus for overtime work. In considering wage averages, the higher wages of foremen must be included. It is further explained that wages are relatively higher, as the cost of living in Germany is lower than in Britain and a majority of the workmen live in cottage dwellings provided for them by the companies at fixed rentals of 25 to 40 m. (\$5.95 to \$9.53) per month, buying food and other necessities from the company stores at low prices.

Wages paid to foremen, it is said, are considerably higher than in Great Britain and were, at the end of September of this year, 340 m. (\$80.99) per month for a blast furnace foreman, 450 m. (\$107.19) per month for a Bessemer converter foreman, 410 m. (\$97.66) per month for an open-hearth foreman, 465 m. (\$110.76) per month for a foreman of a bar rolling mill, 610 m. (\$145.30) for the foreman of a sheet rolling mill, 330 m. (\$78.61), for a foundry foreman. These wages are based on an hourly

German Wages More Than They Appear

Bonus Payments to Married Men and for Overtime Represent 25 Per Cent More Than Scale Shows

HAMBURG, GERMANY, Oct. 13.—German steel producers claim that the wages quoted for German steel workers in the recent comparison of Euro-

pean and American wages made by the United States Bureau of Labor Statistics (THE IRON AGE, Sept. 20, page 732) do not represent those actu-

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works with American equivalent figured at \$4.86 per £ as follows:

rate of 1.12 m. to 2.03 m. (27c. to 48c.) for an 8-hr. day, to which is added 25 per cent an hour for overtime work. If the employee is married and has children the wage is increased by 30 to 80 m. (\$7.15 to \$19.06) per month.

The average wage paid by the United Steel Works in September to all workmen in the blast furnace and steel works departments, including foremen, apprentices, transport workers, skilled and unskilled labor, was 231 m. (\$55.02) per month. The average wage to skilled workmen, excluding foremen, was in the same month 295 m. (\$70.27). As a result of bonus payments for overtime, the unskilled workman actually receives 23.3 per cent more than his wage rate shows and the skilled worker receives 27.3 per cent more. From September, 1927, to September, 1928, wages to steel mill workers have advanced an average of 17.8 per cent.

The United Steel Works has expanded its interests recently by ab-

sorbing the shares of a large plate and strip steel mill at Charlottenhütte and the Siegerner Eisenindustrie. These acquisitions increase the annual capacity of the corporation 350,000 to 400,000 tons. The statement of the United Steel Works for the third quarter shows 172,595 employees, compared with 177,090 in the second quarter of this year, and 15,394 clerical and technical workers compared with 15,530 in the second quarter. Domestic sales amounted to 231,700,000 m. (\$55,190,940), compared with 215,600,000 m. (\$51,355,920) in the second quarter, and export sales totaled 136,800,000 m. (\$31,585,760), compared with 124,600,000 m. (\$29,679,720). Pig iron output in the quarter was 1,547,987 metric tons, compared with 1,541,871 tons, and semi-finished output was 1,652,311 tons, compared with 1,619,150 tons. During the quarter four Siemens-Martin furnaces ceased operation, two of which were scrapped.

Most mills are well filled with orders, and rolling mills in the North, which buy semi-finished steel in the open market, are experiencing considerable difficulty in securing sufficient for their requirements. In some instances only about half their total needs has been shipped, and importation from Belgium is being considered.

Finished Material.—Domestic buying is heavy, and, with building construction continuing at a high rate, merchants' stocks of structural material and bars have been depleted and many buyers are seeking to replenish their stocks promptly, foreseeing a large demand from the building trade through the winter months. Deliveries being offered, except to a few preferred customers, range from two to six months. Export demand continues fair, but bars are quoted at £6 7s. per ton (1.40c. per lb.), f.o.b. Antwerp, compared with £6 12, per ton (1.45c. per lb.) about a month ago. Beams show a slight advance at £6 2s. 6d. per ton (1.35c. per lb.), compared with £6 per ton (1.34c. per lb.) early in September. Wire rods also have advanced from £6 12s. per ton (1.45c. per lb.) in September to the present market of £6 16s. per ton (1.49c. per lb.), f.o.b. Antwerp. At a recent meeting of the foremost producers of hoops and strip steel in France, Germany, Belgium and Luxemburg, it was agreed to establish uniform selling methods and extras. A committee was selected to examine the various suggestions made, to ascertain that they did not conflict with the present agreement governing exports of tubes and strips.

Sheets.—Formation of a sheet comptoir is again under discussion, and announcement of its organization is expected soon. The sheet market is lagging considerably behind other products, with prices unchanged but generally easy on heavy and medium gages. The lighter gages continue fairly firm, with demand improved.

French Domestic Trade Heavy

Building Expected to Continue Through Winter—German Export Competition Expected to Increase

PARIS, FRANCE, Oct. 10.—Exports of iron and steel are being maintained at a high level, but at present export prices there is a growing possibility of keen competition from the United States and Great Britain, except in certain materials, such as sheets, the prices of which have lagged slightly behind those of other steel products. Another factor that is expected to contribute to a decline in exports is the growing need of German mills for tonnage, which has caused curtailment of their activity in some cases.

In the French domestic market, demand continues large and all branches of the iron and steel industry are well engaged, output being limited only by shortage of labor. Some of the mills rolling heavy material have not put all mills into operation because of the shortage of skilled and semi-skilled workmen. New export business is being sought, especially in the French colonies, and considerable tonnage may be booked for large public works in Indo-China. The present domestic building program is extensive, and in the Paris area the usual winter decline in construction work is not expected.

The domestic market is firm, but further advances in prices are not expected, as producers, in most cases, are opposed to a higher price level, believing that it would lead to demands for wage increases and higher coal quotations.

Pig Iron.—Heavier demand from foundry consumers has brought about an increase in the tonnage available for October from 36,000 tons to 42,000 tons. On this additional 6000 tons, furnaces have agreed to quote an ad-

vance of 10 fr. (39c.) per ton, or 450 fr. (\$17.55) per ton, f.o.b. Longwy, which will be the market for November and December delivery.

Semi-Finished Material.—Export prices are strong, but show some variation, depending upon the tonnage on the books of the mill seeking business. Blooms are at £4 8s. (\$21.38) per ton, compared with £4 10s. (\$21.87) per ton early in September, billets £4 10s. (\$21.87), compared with £4 15s. (\$23.07) about a month ago, and sheet bars £5 (\$24.30), compared with £4 10s. (\$21.87) a month ago.

Belgian Steel Prices Lower

Mills Granting Concessions and Quoting Earlier Delivery—Pig Iron Weak Despite High Price of Scrap

ANTWERP, BELGIUM, Oct. 13.—Business in the domestic market is smaller and prices are beginning to decline slightly from the recent peak. Mills, however, are still in a strong position with plenty of tonnage on their books, and the concessions that have been granted by some mills on certain sizes of finished steel are not regarded seriously. Producers have suddenly begun to offer December-January delivery, which buyers claim is proof that the long delays in shipments, previously reported, were exaggerated. A contributing factor to the decline of activity in Belgium is probably the corresponding reduction of demand in the French market, where mills for the past fortnight or

more have exhibited increasing willingness to grant concessions.

Pig Iron.—Prices show a tendency toward weakness and No. 3 phosphoric foundry iron is quoted at £6 1s. 6d. to £6 2s. 6d. (\$29.52 to \$29.76) per ton, f.o.b. Antwerp. The market on iron and steel scrap, however, is still high, with No. 1 cast for foundries at 128 Belgas (\$17.79) and No. 2 cast at 118 Belgas (\$16.40) per ton.

Semi-Finished Material.—Despite slight softness evident in finished steel and some weakness in the pig iron market, semi-finished material is strong, prices showing a continued upward trend. Only a few transactions are reported, but this is largely because of lack of interest in further

tonnage on the part of makers. Blooms of Thomas grade range from £4 9s. (\$21.63) per ton for 8-in. to £4 16s. (\$23.33) per ton for 4-in. Billets are quoted at £4 19s. (\$24.06) per ton for 3-in. to £5 1s. (\$24.54) per ton for 2-in., all f.o.b. Antwerp.

Finished Material. — Buyers are pressing for lower prices, and concessions from the recent peak of the market are not unusual. French and Luxemburg mills show themselves quite willing to accept plenty of tonnage, even at the lower prices beginning to prevail. Steel bar prices

are easier, except in the small sizes, on which certain producers continue out of the market. Quotations have declined to as low as £6 2s. 6d. per ton (1.35c. per lb.), but the average range of the market is from £6 3s. 6d. to £6 4s. per ton (1.36c. to 1.37c. per lb.), f.o.b. Antwerp. Structural rounds are stronger at £6 2s. 6d. per ton (1.35c. per lb.), and beams are quoted at £5 2s. 6d. per ton (1.13c. per lb.). Demand for steel hoops is light and prices are weaker, with the market at about £6 5s. per ton (1.38c. per lb.), f.o.b. Antwerp.

Steel Imports Are Small

Sellers Here Offer Distress Lots at Low Prices—American Export Rail Prices High

NEW YORK, Oct. 30. — Interest among American consumers in foreign steel is limited. This lack of demand has resulted, in recent weeks, in sales of imported structural material at low prices, despite a continually advancing market in Europe. In the past week, Continental mills have begun to show willingness to quote slightly lower prices, the export market having declined about 5c. per 100 lb. Structural shapes are quotable today at about 1.75c. per lb., delivered New York. Bars are still quoted by European mills at from 1.95c. to 2c. per lb., delivered.

Export business continues small. Chinese merchants are buying small lots of wire shorts, both plain and galvanized, and some tin plate waste

waste. Recent business with Japan has been largely in rails. Yokohama municipality has awarded several hundred tons of grooved and guard rails to an American mill, and the Imperial Government Railways is taking bids on 300,000 tie plates, about 1000 tons. On several recent quotations to Japan on rails, the price of American mills has not been sufficiently low to obtain the business. On a tonnage of 16-lb. and 20-lb. sections the American bid was \$42.50 per ton, c.i.f. Japanese port, while the Continental quotation was £6 8s. (\$31.10) per ton, c.i.f. An inquiry for 50-lb. rails brought out a quotation from the United States of \$36.50 per ton, c.i.f., but it was not low enough to secure the order.

Ore to Be Mined in North Sweden

New Company to Operate in Pitea District—Pig Iron Producers Seek Tariff Protection

STOCKHOLM, SWEDEN, Oct. 13.—A new corporation with a capital of 1,000,000 kr. (\$267,720), has been organized to engage in mining iron ore in the Pitea district, province of Norbotten, northern Sweden. In addition to mining, the company intends to produce iron and steel. It is understood that the ore in the Pitea district is equal in quality to the deposits in Lapland, both being near the sea-coast and convenient for transportation.

The controversy over tariff protection for pig iron played an important part in the recent elections. Producers demanded better protection against low-priced iron from other European countries, and B. G. Prytz, president A. B. Svenska Kullager Fabriken, Gothenburg, argued that Sweden is not in a position profitably to produce iron on a sufficiently large scale for its requirements, as there is a decided shortage of coal. Producers seeking protection pointed to low foreign wages, arguing that Continental prices were largely dictated by the Belgian market, where wages are

about 50 per cent less than in Sweden.

The pig iron market has recently begun to show improvement, partly because of firmness in the European market and partly as a result of a decline in production and an exhaustion of stocks during the prolonged strike at the iron mines. Pig iron output in the first eight months of this year was only 237,300 tons, compared with 275,800 tons in the same period of 1927. Steel output, however, increased, 371,000 tons of ingots having been produced in the first eight months compared with 330,000 tons in the first eight months of last year. The output of rolled products was 268,000 tons, compared with 216,000 tons in corresponding period in 1927.

Exports of iron ore, which reached a minimum in May, have recovered, with mines again in operation. Shipments for the first eight months of the year, however, were only 1,979,496 metric tons, compared with 6,856,468 tons in the same period of last year and 4,612,453 tons in the first eight months of 1926.

Prepare for Engineering Congress in Japan

More than 200 engineers and scientists, it is expected, from New York, Chicago, Boston, Philadelphia and other section of the United States will be numbered among the guests at a royal garden party to be held on the grounds of one of the Imperial Palaces of Japan and at a banquet tendered by the Prime Minister of Japan, in connection with the first World Engineering Congress which will be held in Tokio next year.

Dr. Elmer A. Sperry, chairman of the American committee of the congress, has announced that the delegation will be given an opportunity to observe the engineering and industrial projects of Japan and will be taken on excursions which will cover practically all of the historic, scenic and other points of interest in that country. Committees throughout the United States are arranging for the American attendance and for the papers to be delivered by American engineers.

Maurice Holland, 29 West Thirty-ninth Street, New York, is executive secretary of the American committee. The members of the committee include Edward Dean Adams, H. Foster Bain, W. L. Batt, J. Vipond Davies, E. DeGoyler, Gano Dunn, Bancroft Gherardi, George Gibbs, E. M. Herr, Charles H. Herty, F. B. Jewett, F. R. Low, James H. McGraw, Charles A. McAllister, Ralph Modjeski, William H. Nichols, L. A. Osborne, John V. W. Reynders, Calvin W. Rice, Charles M. Schwab, Alfred P. Sloan, Jr., Elmer A. Sperry, John F. Stevens, Gerard Swope, Calvert Townley, H. H. Westinghouse and William E. Wickenden, New York; W. W. Atterbury and Samuel M. Vauclain, Philadelphia; Howard E. Coffin, J. H. Hunt, W. B. Mayo and C. F. Kettering, Detroit; William Green, Rear Admiral John Halligan, John Hays Hammond, O. C. Merrill, and George Otis Smith and Major-Gen. Edgar Jadwin, Washington; D. C. Jackson, A. E. Kennelly, Arthur D. Little, and S. W. Stratton, Cambridge, Mass.; William Butterworth, Moline, Ill.; C. C. Chesney and E. Wilbur Rice, Jr., Schenectady, N. Y.; W. F. Durand and Charles D. Marx, Stanford University, Cal.; John R. Freeman, Providence, R. I.; Samuel Insull, Chicago; Dexter S. Kimball, Ithaca, N. Y.; Robert A. Millikan, Pasadena, Cal.; Thomas A. Edison, Orange, N. J.; C. F. Scott, New Haven, Conn.; Ambrose Swasey, Cleveland; Elihu Thompson, West Lynn, Mass.; Daniel Willard, Baltimore, and Orville Wright, Dayton, Ohio. Herbert Hoover is honorary chairman of the American committee.

The super airship Graf Zeppelin on its first air voyage over the Atlantic brought to America 2200 invitations to prominent business men throughout the United States to attend the Leipzig Trade Fair in March, 1929.

Public Indifference Injures Railroads

Manufacturers Stress Importance of Railroad Prosperity to General Business—Assail Anti-Trust and Tariff Laws

EMPHASIZING the importance of transportation in developing stabilization in industry, S. P. Bush, American Rolling Mill Co., Middletown, Ohio, struck the keynote at a session of the annual convention of the National Association of Manufacturers devoted to the relationship of railroad transportation to the economic welfare of the country. The association held a convention Oct. 22 to 24 at the Waldorf-Astoria, New York. In presenting the report of the association's transportation committee, of which he is chairman, Mr. Bush pointed out that the rapid development of airplane and motor truck service in recent years has complicated transportation problems, though at the same time it has made transportation potentially a greater force in bringing about industrial stabilization.

He stated that the committee recognizes the need for greater and more intimate coordination of rail and motor transportation, particularly at congested terminals. It also favors the proposal now under consideration whereby the railroads of the country will take over and manage the railroad express business.

The low rate of return on investment realized by the railroads and the indifference on the part of the public to their condition was discussed by Samuel O. Dunn, editor *Railway Age*, New York. He pointed out that the railroads earned only 4.3 per cent on their investment last year and that similarly poor earnings had been realized since 1922. At the same time, he added, the carriers have improved their service immeasurably and this has made possible a reduction of inventories in many industries, thus releasing a large amount of capital for other uses. He referred, as did Mr. Bush, to the recapture clause of the Transportation Act, which provides that the excess of net earnings of any railroad, above 5¼ per cent, must be divided with the Government. It was brought out that the average return of the railroads since 1922 has been only 4.66 per cent, and that while certain roads may have exceeded the Government's figure in a single year, over a period of years they have not. On account of this condition it was suggested that the basis governing recapture should be five years instead of one, so that poorer earnings in one year can be compensated by better earnings in another.

The Jones Bill, now before Congress, which proposes to create a reserve fund of \$150,000,000 for Federal works in times of general

depression, was referred to by Frank W. Noxon, secretary Railway Business Association, as an important factor looking to the stabilization of railroad earnings. "When construction sags," said Mr. Noxon, "down goes railroad traffic. When work on plants of all sorts slows down the depression ramifies throughout all occupations, curtailing freight and passenger traffic and cutting down railroad earnings. A reserve fund, when called out, would furnish immediate employment to thousands of workers and would also bring demand for material from at least 27 different industries. This stimulus would radiate to many other industries and the nature of the public works program would affect every community."

Railroad Purchases Are Business Indicator

Speaking on the relation of railroad expenditures to general business activity, E. B. Leigh, president Chicago Railway Equipment Co., Chicago, stated that many persons not identified with the railroad supply industry show an interest in the welfare of the railroads because when the roads are making normal expenditures upon their properties general business is good. "Three questions," said Mr. Leigh, "seem in order as to the period in which we now are. First, are railroad outlays sub-normal; second, is there any extraordinary factor capable of sustaining general business during a term of sub-normal railroad expenditure, and, third, has general business been, or is it now being, sustained at a normal rate of growth?"

Mr. Leigh pointed out that railroad expenditures have been sub-normal to the extent that the roads, over a five-year period, have been purchasing only enough materials and equipment to hold inventories at a new minimum. As examples of extraordinary factors which have been sustaining general business during a time of sub-normal railroad buying, the speaker mentioned the development of the automotive industry and the phenomenally high rate of building construction. "For many years," he said, "it was common to say that the railroads consumed from 40 to 50 per cent of the total steel output. From 1920 to 1927, this ratio averaged barely 25 per cent." In answer to the third question as to whether or not business has been sustained at a normal rate of growth, Mr. Leigh pointed out that the rate of increase in railroad ton miles during the last ten years has not by a wide margin been sustained

at the pace set after the depressed years of 1893 and 1907.

Commenting on the future prospects, Mr. Leigh said: "In due course the railroads will have taken up all the slack they can in inventory and in efficient use of facilities. Volume of traffic will have developed through the natural growth of population and higher standards of living among consumers. Expenditures on railroad property will average relatively greater than at present. It is perhaps too soon to affirm the doctrine, 'expenditures on railroad property measure volume of general business,' but this factor in our national economy is bound to be at all times so gigantic that it is timely now and always will be to urge a continuance of watchfulness and activity to the end that the financial strength of the railroad shall not be undermined by unsound policy."

Anti-Trust Laws Provoke Competition

Declaring the Sherman Anti-Trust Law is harmful to American industry and that, while intended to prevent the creation of holding corporations which might obtain a monopoly of production, it has actually encouraged corporate mergers, Robert J. Adams, treasurer Adams Mfg. Co., New York, maintained that business needs an affirmative law in its place. The Sherman law, he said, as presently interpreted, operates to produce the exact opposite of what it was designed to do; that is, it stifles competition by making it difficult for the small producers to continue in business. The horizontal consolidations of units seem to be lawful. As a consequence several of our industries have dominant factors which produce commodities formerly competitive and fix the price thereon, while the uncombined competitors of these combinations, working as individual units, are denied by the Sherman law the right to agree on prices even though the agreed prices are not unreasonable.

"All competent authorities," Mr. Adams continued, "are agreed that the anti-trust laws are antiquated, inept and burdensome. The law assumes an honorable business man is a criminal if he uses extra precaution to earn a profit on his investment. It assumes that any agreement is illegal until proved by the perpetrators to be otherwise. That condition makes it expensive, if not almost impossible, to do business successfully."

In solving the problem, the speaker stated that an agency should be created which would be competent to

gather the necessary information to form the basis of a new law. "If the Bureau of Census or any other bureau of the Department of Commerce were given the power to collect all essential statistics on industry and commerce, we might have an excellent fact compendium to begin with. The work would be enough, in fact, to keep an entirely new bureau engaged. It would at least provide a central agency with sufficient authority to gather all the necessary statistics and other data essential to a proper understanding of the day by day development of our business life.

"We are in need of an affirmative statute, one that is calculated to aid and protect industry rather than a law like that under which we are now supposed to operate. The original idea in creating the Federal Trade Commission was to give us just that body we now feel such a need of. It was supposed to advise business men and to assist in putting a stop to unreasonable methods of competition. Price fixing would tend to stagnate business and curtail legitimate competition. It might deprive the consuming public of the right to benefit from manufacturing progress. It would be best to avoid any semblance of price fixing, but that should not

prevent us from endeavoring to prevent price cutting."

George M. Verity, president American Rolling Mill Co., Middletown, Ohio, advocated a reinterpretation of the anti-trust laws. In his opinion the need of restricting free operation of business has disappeared and a reverse situation has now developed. "Greater stabilization and uniformity of operation and control of both production and distribution," he said, "so that savings made may not be dissipated in unnecessary and uneconomic competition, is the great need of industry today."

Urge Federal Tariff Board

Stressing the importance of the tariff in preserving American standards of living, William W. Nichols, Allis-Chalmers Mfg. Co., Milwaukee, and chairman of the association's committee on tariff, reiterated suggestions of the association's board of directors that a non-partisan, semi-judicial board, appointed by the President, be set up in place of the present Tariff Commission. Such a board, he stated, should "be capable of basing its findings on sound and all-inclusive economic considerations.

"Unfortunately," he said, "a fun-

damental weakness so impairs the usefulness of the present commission as to make its continuance a grave question in the minds of some people. Its bi-partisan character suggests a Congressional sincerity in meeting the issues. This bi-partisan division has blocked progress for years. Such tariff increases and the few decreases that have been made to date by the commission have been so trivial in comparison with needs as to hold up for ridicule the whole performance of one of the most important Government institutions."

Suggesting methods by which the National Association of Manufacturers might contribute to tariff reform, Joseph W. Randall, J. Randall & Brothers, Philadelphia, advised the indorsement of a protective tariff free from discrimination or special privilege. He approved the plan of allowing each industry to appoint its own representatives to make recommendations to Congress and to the President regarding its tariff needs without definite or implied support of such schedule by any association representing a variety of trades and industries, leaving Congress and the President to decide whether the schedules so recommended meet the requirements of a tax on imports.

Conditions in Different Industries

Foundries Report Business Not Quite So Favorable—Outlook Excellent in Machinery Field

ANALYSIS by industries of the business survey made by the National Association of Manufacturers, a general review of which appeared in *THE IRON AGE* last week, indicates excellent conditions in the iron and steel industry, some improvement in the foundry business and excellent prospects in the machinery trade.

Iron and Steel Industry Thriving

In the iron and steel industry excellent business is reported by 21 per cent of the companies replying to the questionnaire, good conditions by 43 per cent, fair by 31 per cent, with 5 per cent pronouncing it poor. Twelve per cent of the replies expect an excellent winter business, 51 per cent good, 30 per cent fair, and 7 per cent poor. Compared with last fall, business is pronounced better by 50 per cent, not so good by 36 per cent, and unchanged by 14 per cent. Inventories are regarded low by 15 per cent; normal, by 80 per cent; and overstocked, by 5 per cent. A large increase over last fall in employment is noted by 11 per cent, with 57 per cent noting a small increase, and 32 per cent noting a small decrease. A dearth of skilled workers is reported by 13 per cent, but the supply of unskilled workers is adequate. Small increases in wages since last fall are reported by 76 per cent, and a small decrease

by 24 per cent. Increased production over last fall is reported by 73 per cent, greater sales quantities by 70 per cent, and higher sales values by 60 per cent. The industry is reported 97 per cent free of strikes.

Foundries Lag Slightly

In iron foundries and machine shops trade conditions are pronounced excellent by 8 per cent, good by 40 per cent, fair by 36 per cent, and poor by 16 per cent, with the outlook for winter regarded as excellent by 7 per cent, good by 31 per cent, fair by 49 per cent, and poor by 13 per cent. Last fall's business in the experience of 36 per cent of those reporting is exceeded, with 38 per cent reporting a falling off over last year, and 26 reporting it unchanged. Low stocks on hand are reported by 12 per cent, normal by 74 per cent, and an over supply by 14 per cent. A large increase in employment since last fall is reported by 17 per cent, a small gain by 40 per cent, a large decrease by 5 per cent and a small decrease by 38 per cent. A shortage of skilled workers is reported by 28 per cent, and of unskilled labor by 2 per cent, while large increases in wages over last fall are reported by 10 per cent, small increase by 70 per cent, large decrease by 4 per cent, and a small decrease by 16 per cent. Greater production than at this time last year is reported by

64 per cent, large sales quantities by 50 per cent and higher sales values by 30 per cent. No strikes are reported in the industry.

In the machinery industry excellent business is reported by 25 per cent, good by 28 per cent, fair by 36 per cent, and poor by 19 per cent, while 14 per cent regard the outlook for winter as excellent, 46 per cent as good, 36 per cent as fair, and 4 per cent poor. Compared with last fall, business at present is pronounced better by 49 per cent, not so good by 27 per cent, and unchanged by 24 per cent. Low inventories are reported by 19 per cent, normal by 70 per cent, and overstocked by 11 per cent. A large increase in employment since last fall is reported by 14 per cent, a small increase by 56 per cent, a large decrease by 2 per cent and a small decrease by 28 per cent. Thirty per cent report a shortage of skilled labor, and 2 per cent an inadequate supply of unskilled workers. Production is higher than last year, according to 68 per cent; sales quantities greater, 65 per cent; and sales values higher, 64 per cent.

For number of long-time employees, the Jeffrey Mfg. Co., Columbus, Ohio, maker of conveying and crushing machinery, believes it stands in almost a unique position. The employees have a 20-year service club in which there are 292 active members. At the annual picnic in September, 32 new members were added to the roster. The president of the 20-year service club, O. R. Ehret, has a service record of 49 years.

Refractories Men Discuss Specifications

Methods of Making Tests Considered at Fall Meeting— Proposal to Avoid Duplication of Effort

ABOUT 70 men interested in refractories and their use gathered in the Hotel Vanderbilt, New York, Oct. 24, to discuss problems germane to their work. This was the fall meeting of the American Refractories Institute. Mainly, the meeting was given over to a discussion of specifications for fire-brick for various purposes, and to a consideration of test methods whereby specifications could be checked. Standard load tests, spalling tests, and size requirements formed the subjects of separate papers.

In the morning session there was discussion of a proposal to join hands with the American Ceramic Society in so far as work of the two organizations overlaps, and thus by mutual effort avoid duplication of work. This proposal was received with approval by the members present but must have ratification from the board of directors.

Tests Under Load, Hot

Load tests on brick formed the subject of a paper by C. E. Bales of the Ironton Fire Brick Co., Ironton, Ohio. He showed slides depicting a standard form of furnace for making load tests at high temperatures. About ten brick are handled at once in the furnace, each being subjected to a load of 25 lb. to the sq. in., provided by springs attached to one-half of the grip and adjustable from outside the furnace. Heat is applied at 2462 deg. Fahr. (1350 deg. C.), and surface combustion of gas is used. It is possible to control the atmosphere in the furnace. The test follows the specifications of the American Society for Testing Materials.

While this test is supposed to show the refractoriness of the brick, it does not show how the material will perform in service. Tests of 50 or more types of brick, which were made at the Mellon Institute, Pittsburgh, under the refractories fellowship, showed an average deformation of 5.7 per cent under these tests. Progressive loads were applied; the first test being at 10 lb., then 25, and then 40 lb. to the sq. in., with ascending deformation under the successive increases in load.

Causes of Spalling

Spalling tests were taken up in a paper by Scott McDowell, who referred to the thermal spalling of silica brick, caused by rapid temperature changes. Characteristics of brick were shown on a diagram which gave the expansion ratio of different brick at various temperatures of heating. There is a quick jump in the expansion of silica brick, beginning at 575 deg. Fahr. and running up to 1250 deg. Within this range spalling is

bad; above 1250 deg., however, there is no further expansion and rapid changes in temperature above that point no longer induce spalling. In the range of 100 deg., from 575 to 675 deg., the expansion of silica brick jumps from 1/16 in. to each foot of length to 1/2 in. Strains set up from this cause are relieved by cracking, either internally or on the surface, the latter giving rise to spalling.

Because of wide variations in results on individual bricks, the spalling test, involving dipping in water, should always be made on at least five samples, and preferably on ten. If the percentage loss is to mean anything, the number of dips involved at high temperature should be specified. There may be no spalling in the first three or four dips, and then a chunk will come off on the next one.

Machine for Brick Measuring

Size requirements were taken up by Mr. Phelps of the Mellon Institute, with particular reference to a machine that has been developed at the institute for measuring brick between two plane parallel surfaces. The head is so designed that the 4 1/2-in. and the 9-in. dimensions may be measured without changing the position of the measuring element. For the thinner 2 1/2-in. dimension, however, the head is reversed in position, bringing a third plane surface into play. The lower member, which operates in conjunction with any one of the three upper surfaces, is movable, the extent of its motion being indicated by graduations in connection with the handle operating the moving mechanism. This denotes departure either side of the standard length, width or thickness.

The machine is portable, weighing about 60 lb., and is customarily set on a table or bench. It may be used readily by either the manufacturer or the consumer, and can be made at a cost of about \$60 each in lots of 25 machines.

Announce Personnel of Sanderson Company

Edward P. Sanderson, Robert H. Sanderson, John J. Nolan, William G. Hepburn, Robert A. O'Donnell, William T. Ryan, Leigh N. Vaughan, George McLean and James F. Welch, former officers and members of the E. P. Sanderson Co., Cambridge, Mass., and John C. Huxley, William Robinson, Lester E. Stevenson, Harold Bellamy, Davis G. Wallace and Curtis M. Blood, former managers and members of the Cutter & Wood supply department of the E. P. Sanderson Co., have organized a new company under the firm name of Cutter, Wood & Sanderson Co., succeeding to the mill sup-

ply, heavy hardware, horseshoeing supply and automobile trimming departments of the E. P. Sanderson Co., not sold or transferred with the recent sale of the steel departments to the Joseph T. Ryerson & Son, Inc. The new company will occupy quarters at 222 to 232 Third Street, Cambridge, Mass.

Cleveland Selected for Trial Industrial Census

WASHINGTON, Oct. 30.—The Department of Commerce has arranged to make a trial census of industrial purchases; that is, purchases by manufacturers of raw and semi-finished materials, supplies and equipment. A census of these primary stages of distribution was felt necessary to supplement the census of wholesale and retail distribution made some time ago in 11 cities. The object of each of these censuses is to provide an idea of valuable information to be sought and how to prepare schedules to obtain such information in a national census of distribution such as is provided for in the authorization bill for the fifteenth decennial census (1930) pending approval of the Senate.

While many cities could have qualified for the industrial purchase census, Cleveland was decided upon because of the cooperation offered by the Cleveland Chamber of Commerce, as well as the evident suitability of the city's manufacturing situation. Cleveland had in 1925, according to the census of manufactures for that year, 2212 factories, among which 91 different classifications of industry were doing at least \$100,000 business annually. The total value of products was \$1,094,000,000. Among the leading industries are iron and steel, motor vehicles, foundry and machine shops, electrical machinery and apparatus, slaughtering and meat packing, paints and varnishes, stoves and appliances, clothing, bread and bakery products.

Makes Loans for Further Shipbuilding

WASHINGTON, Oct. 30.—The Shipping Board has issued a statement that it would be another year before the full effect of the Jones-White act on American shipping can be entirely appraised. Its stimulation, however, is cited to show present conditions. Two loans from the construction fund have actually been concluded, those of the American Line Steamship Corporation, in aid of the construction of the Virginia and a sister ship as yet unnamed, and four loans have been authorized for the Export Steamship Corporation, which proposes to build four combination passenger and cargo vessels. Construction has been started on the two American line ships and bids for the construction of the four Export ships will be opened Nov. 5. Three loans, involving the construction of seven ships, are now being negotiated.

Gray Iron Institute to Meet Nov. 14

The Gray Iron Institute, Terminal Tower Building, Cleveland, will hold its first annual meeting Nov. 14 at the Cleveland Chamber of Commerce rooms in the same building. Reports of officers will be received, directors elected for the ensuing year and matters of policy determined.

The institute has shown a healthy growth since it was organized in Philadelphia, May 18. At that meeting directors were chosen for a six months' period, the incorporation of the institute was authorized and other steps were taken to place it on a well established business basis. Since that time considerable progress has been made. Several additional members have been added and the organization now comprises 70 gray iron foundry companies in various sections of the country.

The board of directors has appointed the following nominating committee to name nominees for directors: Chairman Howard J. O'Neil, Western Foundry Co., Chicago; Paul C. DeWolf, Brown & Sharpe Mfg. Co., Providence, R. I.; David L. Sacks, Louis Sacks Foundry, Inc., Newark, N. J.; Harry Cooke, Olney Foundry Co., Philadelphia; William F. Bornfleth, Cream City Foundry Co., Milwaukee.

Davison Development of Neville Island

Davison Coke & Iron Co., Pittsburgh, is moving ahead steadily with its construction program at Neville Island, which includes a cement plant, a battery of by-product coke ovens, a new power plant, betterments to the Neville furnace acquired from the American Steel & Wire Co., and the building of a dock for handling river borne freight. The dock will be built by the Dravo Contracting Co., Pittsburgh. Building foundations will be built by the Rust Engineering Co., Pittsburgh. The Allis-Chalmers Mfg. Co., Milwaukee, has the contract for the cement mill machinery and two De Laval turbo blowers for the blast furnace will be furnished by the Dravo-Doyle Co., Pittsburgh.

Engineers to Discuss New Methods of Shipment

On Dec. 6, at a special session of the American Society of Mechanical Engineers, New York, six papers will be read treating from different angles the problem of shipping materials on skid platforms. Mechanical methods of handling, common in plants throughout the country, have recently entered the distribution field and the Department of Commerce has sponsored a movement to standardize equipment and provide interchangeability in use.

The keynote paper will be delivered by R. L. Lockwood of the department,

who will trace the development of shipping material on skid platforms, outline the possibilities for growth and explain the importance of interchangeability in the equipment. Other speakers will be J. V. Miller, assistant general storekeeper Chicago, Milwaukee, St. Paul & Pacific Railroad, "Application of Skid Shipment to the Stores Department of a Large Railroad and the Economies Obtained"; George B. Wright, freight traffic manager Detroit & Cleveland Navigation Co., "Material Handling by an Inland Waterway Transportation Company"; C. B. Crockett, industrial truck department Society for Electrical Development, New York, "Economic Aspects of Skid Shipment from the Standpoint of the User"; F. J. Shepard, Jr., treasurer Lewis-Shepard Co., Boston, "The Part Played by the Manufacturer of Trucks and Skids in the Adoption of Interchangeable Equipment"; F. E. Stocker, resident manager McCormick Steamship Co., "Application of Skid Shipment in the Field of Ocean Transportation."

New Gas for Protection Against Fire

The American-LaFrance & Foamite Corporation, Binghamton, N. Y., through its industrial fire equipment division, has placed on the market a system of carbon dioxide protection against fire known as the Alfite system. It employs an inert gas known as Alfite confined in a liquid state in metal cylinders 51 in. in height and 8½ in. in diameter under a pressure of 900 to 1000 lb. When the system is placed in operation a plunger ruptures a copper disk used to seal the gas in the cylinder and permits the gas to pass through piping to nozzles located at the fire. Here the gas is liberated into the room or space being protected, where it expands and dilutes the air, thus to smother the flame. The system may be operated manually, semi-automatically or automatically, and a variety of operating devices are available.

Trade Extension Flight to South America

To improve trade relations with the South and Central American countries an American-made tri-motored monoplane will make a non-stop flight from North America to South America, and will then tour the principal Latin-American countries. In each of the trade centers visited an industrial moving picture will be shown, describing the American cities supporting the flight and a group of representative industries that are seeking Latin-American trade. In addition, a booklet on American products, printed in the languages of the countries visited, will be distributed.

The organization behind the undertaking is the South American Trade Extension flight. Hugh Morrow, president Sloss-Sheffield Steel & Iron

Co., Birmingham; Gen. William L. Seibert, chairman Alabama State Docks Commission and the Boulder Dam Commission, and S. C. King, vice-president of the Bank of Ensley, Ensley, Ala., are initial members of an advisory board now being selected. Lieut. Donald C. Beatty of the 106th Aero Squadron is chief pilot and director of the flight. The Bank of Ensley is acting as trustee for the organization and S. C. King is trust officer.

Program of Institute of Steel Construction

The program of the sixth annual convention of the American Institute of Steel Construction, to be held at Biloxi, Miss., Nov. 13 to 17, includes the following papers:

"Steel and Its Markets," by C. H. MacDonald, Colorado Fuel & Iron Co.

"Structural Steel in the Federal Building Programs," by J. Edward Cassidy, consulting engineer, Washington.

"Welding as Applied to Structural Steel," by Fred T. Llewellyn, president American Welding Society.

"Flame Cutting of Structural Steel," by E. A. Doyle, consulting engineer Union Carbide & Carbon Corporation, New York.

"The Buyer's Attitude on Competitive Selling," by L. F. Boffey, editor *Purchasing Agent*.

"Character in Salesmanship," by C. K. Woodbridge, president Kelvinator Corporation, Detroit.

"Fire Protection," by Clinton T. Bissell, associate consulting engineer National Board of Fire Underwriters.

"Steel Joists in Buildings," by Frank Burton, consulting engineer, Detroit.

"Art in Bridge Design," by Dr. J. Horace McFarland, chairman Pennsylvania State Art Commission.

British Steel Imports and Exports Both Decline

WASHINGTON, Oct. 29.—Imports of iron and steel products into Great Britain in September aggregated 184,464 gross tons, a decrease of 32.2 per cent under imports of 272,368 tons in August, while exports from Great Britain in September amounted to 295,123 tons, a decline of 20.2 per cent under outgoing shipments of 369,779 tons in the preceding month, according to a radiogram received by the Iron and Steel Division, Department of Commerce, from Commercial Attaché William L. Cooper, London.

The sharp decrease in September imports was due to a drop in almost all lines. The only gains were in 2904 tons in "all other manufactures" and 2845 tons in pig iron, together with an inconsequential increase in cast tubes. The greatest drop was in ingots and blooms, which fell off 46,576 tons, or from 114,472 tons to 67,896 tons.

Of the drop of 74,635 tons in exports, the greatest declines were in tin plate, 17,898 tons; galvanized sheets, 15,430 tons; plates and sheets, 15,076 tons, wrought tubes, 7753 tons, and steel bars, 2654 tons. The only gain of consequence was in pig iron, 3364 tons.

Discuss Blast Furnace Problems

Eastern States Association Finds Advantage in Using Open-Hearth Slag—Touches on Bell Diameters

PITTSBURGH, Oct. 27.—Attendance at the fall meeting of the Eastern States Blast Furnace and Coke Oven Association at the Shannopin Country Club, Ben Avon, Pa., Friday, Oct. 26, suffered from the fact that the fall meeting of the American Iron and Steel Institute was being held the same day in New York. Smaller representation than usual at the blast furnace and coke oven meeting failed to affect the interest, which ran high in such matters as the efficiency and the quality of the iron produced in large modern steel works blast furnaces as compared with those of smaller dimensions.

The benefits derived from the use of open-hearth slag to replace limestone in the blast furnace were stressed. With slag running as high as 27 per cent in iron, there was not only this addition to yield, but the use of limestone could be cut by 400 to 500 lb. per ton. There was altogether, making allowance for the high manganese content of the slag iron, a possible saving of 50c. per ton in the cost of making pig iron.

Discussion of the distribution of the burden touched strongly on the size of the bell and the stock line, and the need of a definite relationship between the bell and stock line dimensions if there was to be the distribution of charge that would permit penetration of the gas. The trend toward the small bell was held to be correct if it did not result in one too small. A 12-ft. bell and a 17-ft. stock line was said by several speakers to be the proper proportion relationship.

The discussion of the relative merits of coke made from straight high volatile coal and that produced from

a mixture of low and high volatile coal veered more favorably to the latter. What the makers of blast furnace refractories are doing to improve their quality was told by the representative of one of the larger manufacturers, who pointed out with an increased use of flint instead of plastic clays the brick might suffer in appearance.

While it was said that credits of close to \$2 a ton might be made from blast furnace gas, there was also a suggestion that a study of the costs of the equipment necessary to utilize fully the waste heats might make the investment of doubtful value, since the saving would be burdened with the added financial overhead.

A. E. Maccoun, superintendent of blast furnaces Edgar Thomson works, Carnegie Steel Co., Braddock, as chairman of the round table discussion, ably handled the meeting. B. W. Winship, superintendent of coke plant Bethlehem Steel Co., Steelton, Pa., and president of the association, presided at the evening meeting, at which W. L. Stevenson, chief engineer Pennsylvania State Department of Health, and F. H. Waring, T. E. Dugan, E. S. Tisdale, holding similar positions in the State health departments of Ohio, Kentucky and West Virginia, detailed the successful solution of the problem of phenolic wastes from coke plants in rivers drawn upon for drinking water.

President Winship announced the appointment of O. O. Malleis, chief chemist Koppers Co., Pittsburgh, to succeed John W. Hacker, formerly superintendent of coke plant Central Alloy Steel Corporation, Massillon, Ohio, as chairman of the coke testing committee of the association.

built. The common control of the two companies is the basis of reports that Aston iron would be used for making seamless pipe, but officials of the Byers company say no arrangement of this sort has been made and that none is contemplated.

Eliminates Hand Puddling Methods

The Aston process is one designed to eliminate the costly hand puddling method of making wrought iron and is a system of independently refining the base metal and then effecting disintegration of this metal and incorporation of the slag to produce wrought iron.

The base metal is refined to a degree conforming to commercially pure iron characteristics in a Bessemer converter. This molten metal is poured from a ladle into a thimble containing molten slag of puddling characteristics. Without application of either manual or mechanical working of the mass, the metal is disintegrated into a sponge, impregnated with molten slag. The resultant ball or sponge is pressed to a rectangular bloom, and rolled to billet or bar sections.

In addition to the refining accomplished in the converter, the entry of the metal into the slag is said to secure a high degree of super refining. In addition, the dominant characteristic of wrought iron, namely, the uniform and fine dissemination of slag throughout the product, is effected.

H. A. Brassert & Co., Chicago, who have cooperated with the A. M. Byers Co. at Warren, Ohio, in developing the Aston process for making wrought iron, have been given the contract for the engineering for the new Byers plant. The plant will consist, in addition to the department to make the wrought iron, of a 40-in. blooming mill, a 42-in. universal plate mill, an 18-in. and a 16-in. semi-continuous skelp mill and a 14-in. and a 9-in. skelp mill. When completed it will have an annual capacity of 360,000 tons of skelp and plate.

A. M. Byers Co. Plans Large Expansion

Plant and Equipment for Utilization of Aston Process of Making Wrought Iron Will Cost \$10,000,000

EXPERIMENTAL work by the A. M. Byers Co. at its Warren, Ohio, plant with the Aston process for making a synthetic iron having the same chemical and physical properties as hand puddled wrought iron has been attended by success sufficient to warrant production of the new material upon an enlarged scale. Accordingly, the Byers company will soon begin work on a new plant to be erected on a site of 112 acres recently acquired at Harmony, Pa., not far from the steel fabricating district which embraces Ambridge and Economy, Pa.

Complete plans for the new plant call for an expenditure of \$10,000,000 and include pipe mills, a blast furnace, a by-product coke plant and a river terminal for handling inbound raw materials and river shipments of finished products. The initial units of

the new plant, with a monthly capacity of 15,000 tons, will include the cupolas for melting cold pig iron, Bessemer converters for refining the molten iron, the thimbles for holding molten slag of puddling characteristics, and rolling mills for bringing the ingot to skelp form. The South Side plant of the company in Pittsburgh, containing one butt welding and two lap welding furnaces, capable of making pipe from ¼ in. to 12½ in. diameter is to be utilized for making pipe of the Aston iron. The company plans to spend \$1,000,000 in betterments at that plant.

The Byers company and Spang, Chalfant & Co., Inc., are under the same control, and the latter recently absorbed the Standard Seamless Tube Co., with a plant at Economy near where the new Byers plant is to be

Martin Aircraft Plant Goes to New Company

Commercial airplanes will be built in Cleveland by the Great Lakes Aircraft Corporation, incorporated to take over the plant now occupied by the Glenn L. Martin Co. The new company will acquire all the present equipment of the Martin plant. The Martin company will move in January to Baltimore, where it will devote its attention exclusively to the manufacture of military aircraft. It is understood that about \$2,000,000 was involved in the sale of the Martin plant. William R. Wilson, president Guardian Trust Co., Detroit, and for many years identified with the automotive industry in that city, is chairman of the board of the Great Lakes Aircraft Corporation.

Wholesale Prices Higher in September

Commodity prices in September are reported by the United States Bureau of Labor Statistics at 100.1, on the basis of the 1926 average at 100 for 550 items. This represents a substantial increase from the 98.9 recorded in August and is still further above the 96.5 of September, 1927. Farm products and foods show the heaviest advances of any items during the month. Live stock and poultry in the one group and meats in the other recorded advances of more than seven points in each instance. Fractional advances were made in fuels, metals, building materials, chemicals and the miscellaneous items, while there were fractional recessions in leather and textile products. House furnishing goods showed no change.

Metals and metal products are placed at 100.5, compared with 100.4 a month earlier and with 97.6 a year ago. Iron and steel and non-ferrous metals both advanced slightly, while automobiles showed a fractional recession and agricultural implements and other metal products were unchanged from the preceding month.

Food prices have gone so high, in some items, that the bureau's index of retail prices shows the several grades of beef at the highest level in many years—higher even than in the war period or in the price "bulge" of 1920.

Coke Production at Higher Daily Rate in September

WASHINGTON, Oct. 20.—Total production of by-product coke for the 30 days of September was 3,958,682 net tons, against 3,994,924 tons in the 31 days of August, according to the Bureau of Mines. The daily average rose from 128,869 tons to 131,956. Production of beehive coke in September was 312,000 tons and the daily rate was 12,520 tons, against 10,667 tons in August. Total output of both by-product and beehive coke for September was 4,270,682 tons, compared with 4,282,924 tons in August.

Steel Castings Orders Largest Since May

Aggregating 82,173 tons, or 57 per cent of the monthly capacity of 144,200 tons of the 129 makers reporting to the Department of Commerce, orders for commercial steel castings in September were the largest since May, when new business amounted to 86,414 tons.

Orders in August were 81,452 tons, or 56 per cent of capacity. Production in September totaled 75,199 tons, or 52 per cent of capacity, against 87,320 tons in August.

Orders in September were divided as follows: Railroad specialties, 35,234 tons, or 52 per cent of this class of capacity; miscellaneous castings, 46,939 tons, or 65 per cent of capacity.

Production in September included

25,311 tons of railroad specialties, or 38 per cent of such capacity, and 49,888 tons of miscellaneous castings, or 65 per cent of such capacity.

Total orders for the nine months ended with September were 737,222 tons, against 727,314 tons for the corresponding period of last year. Production for the nine months of this year was 765,773 tons, compared with 784,977 tons for the corresponding period of last year.

Malleable Castings Orders Show Slight Loss

Orders for malleable castings in September totaled 55,278 tons, against 56,415 tons in August, according to reports received by the Department of Commerce from the principal manufacturers. Production was 56,650 tons, or 63.2 per cent of capacity, compared with 61,833 tons, or 68.5 per cent of capacity in August, while shipments were 55,645 tons and 58,914 tons, respectively.

Orders for the nine months of the present year totaled 492,039 tons, against 440,825 tons for the corresponding period of last year. Production was 529,158 tons and 495,902 tons, respectively.

Smaller Output of Steel Boilers Reported

New orders in September covered 1420 steel boilers, with heating surface of 1,251,268 sq. ft. These are the smallest figures in several months, but are above those of September, 1927, which were 1312 units and 1,152,265 sq. ft. The August figures were 1649 boilers and 1,459,652 sq. ft. For the first nine months of the year orders totaled 12,466 units and 11,833,937 sq. ft., compared with 12,387 units and 12,771,356 sq. ft. last year.

Steel Barrel Production Falls Off in September

Production of steel barrels in September is reported by the United States Department of Commerce at 593,255 units, with shipments totaling about the same amount. This represents 50.2 per cent of capacity. There has been a sharp falling off from immediately preceding months, in which new high records were made. The September figure, which is the lowest since February, compares with 677,313 units in August. It is, however, much higher than the 521,899 units of September, 1927.

Unfilled orders at the end of the month were the lowest since Nov. 30, 1927. They called for a total of 996,820 barrels, of which 292,686 were for delivery within 30 days.

Shipments of members of the Steel Barrel Manufacturers' Institute in September numbered 328,597, and unfilled orders at end of month called for 377,922 units. The business of the month is reported at \$949,164. Capacity was used to the extent of 48

per cent, representing 24.3 per cent for I.C.C. barrels and 54.5 per cent for light barrels.

River Steel Movement Heavy

The down-river movement of steel from the Pittsburgh district was heavy again in September. The monthly report of the Pittsburgh office of the United States Engineers' Corps shows the Ohio River movement to have been 125,062 net tons, compared with 124,751 tons in the preceding month and 98,809 tons in September last year. For the nine months ended with Sept. 30, Ohio River steel shipments from the Pittsburgh district were 894,306 tons, a monthly average of 99,367 tons. In the same period last year the total was 487,504 tons, an average of 54,169 tons monthly.

Automobile Output Within 2 Per Cent of 9-Month Record

WASHINGTON, Oct. 27.—Production of motor vehicles in the United States in September declined to 413,722 from 461,356 in August, according to the Department of Commerce. Of the September output, 358,872 units were passenger cars and 54,850 were trucks. The August output of passenger cars was 400,593 while the production of trucks was 60,763. The September, 1927, figures were 226,443 passenger cars and 33,944 trucks, a total of 260,387.

Nine-month automobile and truck production this year has far exceeded that for the corresponding period of last year, totaling 3,469,075, against 2,906,672 vehicles, a gain of 19.3 per cent. The output of passenger cars for the nine months in 1928 was 3,064,237, and of trucks, 404,838; comparing with 2,540,312 and 366,360 respectively for last year.

In 1926, the record year, the total production in the first nine months was 3,540,153, or 2 per cent ahead of 1928. This included 3,153,922 passenger cars and 386,231 trucks. In 1925, which had a total production within 1 per cent of that of 1926, and exceeded it in trucks, the nine months showed 2,746,877 passenger cars and 387,447 trucks, a total of 3,134,324.

September production of automobiles in Canada, as reported to the Department by the Dominion Bureau of Statistics, was 16,572 passenger cars and 4621 trucks, compared with 24,274 passenger cars and 6971 trucks in August.

Apparent consumption of babbitt metal in September was the largest for any month since August of last year. Reports received by the Department of Commerce place the total at 5,308,403 lb., compared with 4,755,662 lb. in August and with 4,792,367 lb. in September, 1927. For the first nine months the total was 43,263,987 lb., compared with 46,024,504 lb. last year.

This Issue in Brief

Unreliable cost figures result when manufacturing burden is charged on the basis of direct labor cost, except when plant makes only a single article, of one size, says cost accountant. "There is no relation between operator's compensation and the cost of running the machine." Burden should be charged on the basis of normal operating hours.—Page 1097.

* * *

Costs less to make certain parts of alloy steel than of plain steel. Automobile parts manufacturer uses cold-drawn nickel steel instead of plain carbon steel, which has the necessary strength, because uniformity of the alloy steel gives lowest cost per finished part.—Page 1093.

* * *

Loans can be secured more easily if manufacturer is able to budget or to forecast operations. Confidence on the part of the banker and of the management of the business itself is promoted by ability to forecast or to budget.—Page 1098.

* * *

Stock danger limit is established monthly. Automobile manufacturer calculates parts danger limit monthly, and provides for an average three months' supply.—Page 1081.

* * *

To obtain clean castings, skim gate should be designed to choke the metal where it enters the inlet gates that lead to the mold, and at the same time provide a free escape for all impurities collected at this point.—Page 1082.

* * *

Ford is now using about 15 lb. of malleable castings in Model A cars, and may increase to 40 to 60 lb. Castings replace forgings, due, it is understood, to failure to get forging deliveries.—Page 1107.

Stable and well-sustained volume of business during the winter months is indicated, says Dr. Haney. The outlook is that earnings will be fair to good in a majority of industries.—Page 1105.

* * *

Highest strength castings are usually low in total carbon, with pearlitic or even sorbitic matrix, says metallurgist. General grain size is small, and there is a very fine distribution of graphitic carbon.—Page 1084.

* * *

Fluctuating prices compel steel buyers to speculate on the cost of their raw material, says Charles M. Schwab. Policy of open prices would be of benefit alike to producers and consumers, he declares. Price stabilization is possible without collusion on part of producers.—Page 1086.

* * *

Flaws in steel rails can be accurately located within 1/32 in. of actual place where they exist, by passing an electric current through the rail. If the rail has no defects, recording apparatus will show a straight line. If there are defects, the current is obliged to pass around them, thus immediately recording the location.—Page 1090.

* * *

Fatigue tests on welds are needed. Scattering results of published fatigue tests indicate that none of them can be relied upon, says Bethlehem Steel Co. executive.—Page 1092.

* * *

Rusting of welds is retarded by using coated or covered electrodes, engineer declares. Rust resistance is better than when standard bare wire is used, he says. Recommends study of relative corrosion of weld and base metal, and meanwhile recommends paint to keep corrosion in check.—Page 1092.

Speeds stockroom operations by mounting on conveyor trays cardboard symbols designating the section to which trays are routed. Thus stock clerks can tell from a distance which trays are for their respective sections and be ready to remove their trays without confusion.—Page 1076.

* * *

True volume of business and industry is only moderately large, says Dr. Haney. Railroad freight traffic and wholesale trade are both below what they were a year ago. In comparison, the high rate of speculation seems excessive.—Page 1104.

* * *

Errors in handling stock are reduced by placing similar kinds of parts in different sections of stock room. Parts resembling each other in size and form can advantageously be separated, automobile manufacturer finds. Thus each stock man has parts so different that he has no trouble in recognizing parts wanted on requisitions.—Page 1076.

* * *

Heart of parts storeroom is one continuous conveyor serving every department. Chain-type conveyor in automobile parts storeroom follows a devious route, making dips, turns and rises. It carries parts from stock clerks to checkers and stock replenishments to stock clerks.—Page 1076.

* * *

Export trade in steel continues high. September shipments were below August but 39 per cent above last year. Machinery exports declined sharply, September having been 25 per cent below August, and 4 per cent under September, 1927.—Page 1105.

THE IRON AGE

W. W. MACON
Managing Editor

ESTABLISHED 1855

In Prosperity Prepare

IN time of prosperity prepare to keep prosperity. This was the gist of the presidential address of Charles M. Schwab before the fall meeting of the American Iron and Steel Institute. He believes that the problems of the post-war period are largely behind us and that industry has the foundation for a prosperity far beyond anything it has yet seen. In so saying he was not merely expressing the native optimism that has carried him far on the road of success, but he supported the statement by one of the most searching and comprehensive analyses of steel trade conditions ever presented to the institute.

A fundamental change to which the address called attention is the retarded growth of steel consumption. Once demand virtually doubled every decade; in the past 15 years it has increased only 55 per cent. Thus the industry can no longer rely on expanding consumption quickly to overtake overexpanded capacity. Warning against the temptation to add new plant under the stimulus of recent prosperity, Mr. Schwab urged a temporary "moratorium" on such construction. Demand, he said, is now more nearly in balance with supply than at any time since the war, and this favorable relation can be quickly upset.

Along with his caution against plant expansion Mr. Schwab made a plea for an open one-price policy in selling steel. On first thought this might seem like overstressing the need of a more stable market, in view of recent improvement in prices. But, as Mr. Schwab pointed out, it is idle to expect to cure indiscriminate price cutting in periods of slack demand merely by preaching economic truths. Obviously the time to initiate reforms in selling is when demand and supply are fairly balanced. And the way to make such reforms stick is by preventing the balance from being disturbed by overbuilding.

A third specific offered by President Schwab is the development of new uses for steel. Here is an activity to which the individual producer may well devote the energies that are often unwisely expended in adding to capacity or in fighting for 100 per cent operation in a time of 80 per cent demand. By creating new outlets the danger of a recurring surplus supply is reduced. As was well said by George M. Verity, president of the American Rolling Mill Co., in the discussion on Mr. Schwab's address, steel producers must establish a better liaison between the mills and their trade. They must make the customer's business their study, helping him to find the material best suited to his needs and assisting him in working out the problem of fabricating it to best advantage. When such service is given, new uses for steel will be found and

the tonnage price of raw material will become a secondary consideration, since the steel user's main interest is in reducing his total manufacturing cost.

All three of Mr. Schwab's suggestions are practical and sound. They call for no radical departure from principles under which the industry has grown to its present stature. They urge no concerted action in regulating either prices or production. They are convincing counsel for more intelligent conduct of business, putting faith in voluntary cooperation and individual initiative. Most constructive of all and of largest significance is that part of the address dealing with new uses for steel. As *THE IRON AGE* often has pointed out, no other field holds such promise for united effort by the members of the institute and in no other activity can it find greater justification for its existence.

Economics of Steel Making

MYRON C. TAYLOR, chairman of the finance committee of the United States Steel Corporation, delivered last week at Columbia University an economic address on the steel industry that was erudite and informing. It would be helpful if there were equally masterly summaries of other major industries. An aggregation of such would go a long way toward illuminating our industrial and economic position. We shall try to analyze Mr. Taylor's survey and to correlate it with a broader one.

Mr. Taylor reports that the production of 48,000,000 tons of steel ingots in 1926 involved the labor of a million workers and the use of 200,000,000 tons of material. That material may be reckoned as comprising 70,000,000 tons of iron ore, 81,000,000 tons of coal and 14,000,000 tons of limestone, besides other things.

We are unable to follow the estimate of a million workers employed in the production of 48,000,000 tons of steel ingots. The Steel Corporation itself in 1926 employed a little over 250,000, and inasmuch as it produced about 42 per cent of all the steel and about 43 per cent of the iron ore, there is indicated a total occupation of about 600,000. On the basis of the Steel Corporation data the total employment would have been about 32,000 in the mining of iron ore, about 62,000 in mining coal and making coke and 61,000 in transportation, the remainder of the employment in this industry being in its metallurgy and manufacturing. This is, however, a measure of only the steel industry. Iron and steel together employ more persons. According to the census for 1925 about 50,000 were employed in iron mining and about 850,000 in metallurgy and manufacturing. If we con-

jecture about 100,000 in accompanying coal mining and coke making we should arrive at a total of about 1,000,000 for the iron and steel industry. Perhaps it was something like this that Mr. Taylor meant.

According to Mr. Taylor all workers of the iron and steel industry received an average of about \$1,400 in the year, their average rate of wages being 12 per cent higher than the hourly average in all the industries covered in the recent report of the National Industrial Conference Board. The average of the Steel Corporation alone was higher than that, the figure for all employees being \$5.94 per day, and \$5.82 if the salaries of general administrative and selling force be excluded. The total payment for wages came to \$1,846 as the average for the year. We may compare that figure with the average of \$1,656 received by 1,800,000 workers in steam railroad transportation, which is another of our major industries. We may make further comparison with the estimate by Dr. W. R. Ingalls of the total national internal income in 1926 as 74.2 billion dollars, which would be \$1,613 for the estimate of 46,000,000 workers. The total internal income is a direct function of work in one way or another, inasmuch as even dividends and interest must be expended in some form of work.

In Mr. Taylor's calculation the actual investment in the steel industry is about \$4,750,000,000; but replacement cost, less accrued deterioration, would be at least \$6,000,000,000. On the former basis the profit yield in 1927 was only 5.29 per cent, compared with 6.89 per cent in 1926 and 5.66 per cent in 1925. If computed on reproduction value the returns would be correspondingly smaller. Either way the capital estimates are on the basis of an overbuilt industry, the steel works having an aggregate annual capacity of 60,000,000 tons of open-hearth and Bessemer steel ingots compared with a maximum requirement of 50,000,000 tons. No industry can operate continuously at 100 per cent of rated capacity, but also it may be said that no industry requires a surplus of 20 per cent.

In so measuring the country's excess capacity in steel Mr. Taylor definitely confirms Mr. Schwab's judgment, expressed last Friday, that "the technological developments resulting in improved processes, and enlarged units alone will render unnecessary for a considerable period the building of new plants to meet increased demand."

The Culmination of Research

A YEAR ago, and again last Friday, the program of the American Iron and Steel Institute contained an unusual feature, worthy of imitation by other engineering and industrial associations. Rarely indeed do the faithful listeners hear anything beyond sober technical details. Judge the glad relief when a year ago S. M. Kintner and last week W. B. White gave vivacious accounts of those by-products of industrial research which help make the world more livable and enjoyable. By means of such researches the iron master becomes less a producer of humdrum bolts and spikes, and turning patron of the arts gives the artist more perfect instruments for expression and devices whereby his art may be broadcast so that all who listen may be uplifted. A year ago Mr. Kintner, in illustrating recent advances made possible by the vacuum tube, recreated for his de-

lighted audience the weary but resonant voices of the "Two Black Crows." On Friday, Ernest Schelling (an equally human virtuoso) "discussed" Mr. White's paper on the testing of piano wires by drawing forth, from a Steinway grand piano, bells and rippling waves, floating clouds and dancing feet and stormy passion.

With Mr. Schelling we are glad this is not yet an altogether wireless world.

Automobiles Take More Steel

IN the manufacture of automobiles, trucks and replacement parts about 25 per cent more steel is being used this year than in 1926, hitherto the record year. A more precise statement will be made available by the annual presentation of THE IRON AGE at the beginning of the new year, dealing with "Where steel went in 1928." As compared with 1926 there is an increase in the number of automobiles and trucks made, and an increase in the consumption of steel per unit. While there is an increase this year in the total steel production, that is a smaller increase, and the result will be a record high proportion of the total steel passing into the automotive industry, probably about 17 per cent, against 14½ per cent shown by our presentation for 1926.

The Department of Commerce reports 413,722 passenger cars and trucks made in the United States in September, and adding Canada at 21,193 gives a total for the month of 434,915. With a slight upward revision now made for August that month's total is 492,601. The total of cars and trucks, United States and Canada, for nine months is 3,671,727.

Whether there was an actual decrease in rate from August to September is a question. Counting Ford at five days a week and others at five and a half days there was a decrease in working time from August to September of about 15 per cent, but the Department of Commerce reports production as "factory sales," and the extra Saturday, Sunday and holiday in September might perhaps be regarded as increasing rather than diminishing the month's opportunities. Striking a daily average for the two months and rating October at 95 per cent, November at 90 per cent and December at 70 per cent would make a year's total of 4,850,000, which may thus be taken as a fairly liberal estimate.

Given the number of units produced, a weight factor is requisite. Our annual returns of "where steel went," divided by the number of cars and trucks produced, showed decreasing quantities per unit through 1924, as Ford and other light cars became more prominent. Thereafter substantial increases occurred, for several reasons, more closed bodies, more all-steel bodies, in 1927 the light production of Ford and of late the trend of many cars, including Ford, to be made heavier as the much more powerful engines required a stiffening all around. In our present estimate we assume 15 per cent more steel per unit than was shown for 1926, which involves a slight increase over 1927. The increase over 1926 in the number of units is about 8 per cent. With more cars in service, more replacement parts are produced.

As to steel production, this year's steel ingot total promises to run above 49,000,000 tons. With so much fine steel being made, the proportion of rolled steel to ingots may be taken at 73 per cent against the

74 per cent of 1926, which would make 3 per cent increase in rolled steel production.

Putting all these factors together, we have about 25 per cent increase in automobile steel from 1926 to 1928 and an increase in the automobile percentage of total steel from 14½ to about 17.

It is of interest just at the moment that lately the proportion of the steel output taken for automobiles has been considerably above the year's average, probably somewhat over 20 per cent.

Standard Machine Tool Market

IN an editorial discussion of "British Machine Tools," inspired by the recent machinery exposition at Olympia, *Engineering* lays emphasis on the still existing market for standard machine tools as distinguished from special purpose machinery required in mass production. Of course, such a market remains in Great Britain in a probably greater ratio of importance than in the United States. At the present time the American demand for standard tools is greater than for some years, riding along on the wave of buying of more or less special machinery.

The London editorial goes on to say: "We hear a great deal in these days of the progress of the American special machine, and of the wonderful developments which are taking place as a result in manufacturing plants of the United States. While all the world may become thus highly organized mechanically in some distant future, it cannot be contended that at present the world demand for tools has been exhausted when the requirements of these specialized factories have been met."

The point will be conceded naturally, but with the reservation, as applied to the United States, that the use of special purpose machinery is not by any means confined to the large establishments. The English writer cites the extreme case of immense plants which manufacture for and maintain the Bell Telephone system, and continues in a general discussion of the trade in Great Britain, with pertinent comment, as follows:

All said and done, such trade forms only a part of the total, even in such a country as the United

States. The bulk of the work is done on more general lines, simply because a great deal of it will not, even with the application of the utmost amount of ingenuity, lend itself to stereotyping. Here (in England) where our manufacturing methods are not at their best, cast on the same gigantic proportions, the works requiring special machines are relatively few and the demand at best is for single tools, instead of dozens. In such cases it may be attractive to the buyer to deal in the American market. The factory methods of that country have been so loudly proclaimed, it is natural that he should wish to adopt a tool successfully applied over there. He is also faced with the possibility that if he tries to get his requirements met over here and allies himself with a toolmaker for the purpose, the machine produced may be inordinately expensive. This is the unavoidable consequence of the small demand. Yet it is satisfactory to know that, even in such lines, our makers can make headway, and that today designers and makers are ahead of the requirements of the most modern factories in the country.

We have referred to the non-specialized work to be done. Of this there is a great amount all over the world, including both the United States and this country. While American special machines may contribute in no small degree to our retained imports, it is not generally accepted that the special purpose tool is imported largely by this country from Germany. If this is so, it follows that for some reason or other Germany is supplying us with tools which our makers could equally well produce, which certainly should not be the case.

The United States is dotted over with manufacturing plants and such establishments as railroad repair shops, in which standard machinery is used to a greater or less extent and always will be used. Unfortunately, perhaps, for their makers, a characteristic of machines of this class is that even in their old age they can do the work required, though at much less speed and much higher cost when compared to the production by modern tools of similar type. In the last few years replacement of antiquated equipment has been much slower than it should have been, but signs now are that business from these sources will result in a quickened market for standard tools; though at the same time, in many cases, obsolete machinery will be replaced by specialized tools.

Record Run on a Merchant Furnace

RECORDS of blast duration have not been reported as carefully as daily tonnage production of blast furnaces. Stack "A" of the Toledo Furnace Co. ran on one lining from Nov. 6, 1919, to Aug. 22, 1928—a period of 8 years, 9 months and 16 days. This is not the longest one-blast period ever reported, as one small furnace was in constant operation on the same lining for over 10 years. But that small stack made, nearly all that time, one grade of iron—standard Bessemer pig.

Outstanding in the achievement of the stack at Toledo is the fact that it made during its run 1,823,251 tons of pig iron—far in excess of any tonnage ever before produced on one lining. The average was 564 tons a day over the entire 3212 days. What is still more notable, the furnace steadily

increased its daily average by years, so that, during its last year of operation, it made more daily tonnage than during any other year. Its average output in 1926 was 602 tons a day; in 1927, 614 tons; in 1928, 627 tons. The amount of "off" iron made averaged only 1.8 per cent. The amount ran up sharply during the year of the coal strike, owing to the use of poor coal. Leaving out that year, the "off" iron ran only 1.2 per cent of the total, while during the last three years it averaged less than ½ per cent of "off" metal.

This record would not be such an exceptional achievement for a steel works furnace employed in making basic iron continually. But the Toledo furnaces are run on merchant pig iron, and almost every variety except Bessemer is made to meet the specifications of more than 200 customers. To fill the requirements of this trade this furnace has made all grades of

foundry iron, from 1 to 3 per cent in silicon; malleable iron, from 1.25 to 2.75 per cent in silicon; and standard basic. And it has, during the entire period, been frequently shifted from one grade to another—18 different specifications having been made in one 28-day period.

Before this run the furnace was rebuilt and provided with a new shell. The stack, as rebuilt, had an 18-ft. hearth diameter, a 24-ft. bosh and a height of 84 ft. There are no cooling plates above the mantle. After the furnace was blown out, the lining was found smooth and true to circle, and showed no signs of scaffolding. It was 20 in. thick at top of stack, 1 ft. at the middle, and 3 ft. at the mantle. The salamander in the hearth, 214 tons, contained various grades of pig iron made in the furnace. Usually the amount of salamander removed when a furnace is blown out is much larger.

Sharp Increase in October Iron Output

Estimates Indicate a Daily Rate of 108,800 Tons, the Largest in 17 Months—Net Loss of Two Furnaces

ESTIMATES of pig iron production for October indicate a sharp increase over September. Figures collected by wire on Tuesday, Oct. 30, from companies estimating their output for the last three days in most cases, show the October total to be approximately 3,372,000 gross tons, or nearly 108,800 tons per day for the 31-day month. Compared with 102,077 tons per day made in September, this is an increase of about 6.5 per cent. The October daily rate is therefore the largest in the last 17 months, or since May, 1927, when it was 109,385 tons per day. It is also the largest daily rate for October since 1918,

when it was 112,482 tons. In fact, there have been but two October daily rates exceeding that of this year—in 1918 and 1916. Reports indicate a net loss of two furnaces during October—eight furnaces were blown in and 10 were shut down. Apparently, therefore, 195 furnaces were operating at the end of the month as against 197 on Oct. 1. Actual production returns for October will be published in THE IRON AGE of Nov. 8 and the estimates of daily rate and of furnaces in blast may be somewhat altered by the final figures.

Steel Company Earnings

Steel Corporation in Nine Months Has Earned \$8.17 per Share of Common Stock

EARNINGS of the United States Steel Corporation for the third quarter of 1928 were at a rate of \$3.31 per share of common stock (after providing for the preferred stock), compared with \$2.75 in the second quarter and \$2.15 for the third quarter of 1927. The earnings for the nine months of 1928 stand at \$8.17, or more than enough for the regular 7 per cent annual common dividend, with what comes in the fourth quarter available for surplus minus appropriations for betterment or expansion. On the basis of the present issue of 7,116,235 shares of common stock, the net earnings available to common stockholders was, for the first nine months of 1925, 1926 and 1927, \$6.74, \$9.35 and \$7.74 respectively. The net earnings before deducting either preferred or common stock dividends were \$29,886,259. For the third quarter of 1927 they were \$21,585,425, and for the second quarter this year, \$25,868,758. The surplus

for the three quarters amounts to \$20,811,898, in the face of a larger depreciation for the third quarter than for the larger reductions on this account made for the second quarter. The accompanying table shows the statement, including earnings of recent years.

Bethlehem's Prospects Good

The Bethlehem Steel Corporation's net income in the September quarter was \$4,272,528, equivalent after preferred dividends to \$1.43 a share on the common stock. Although off slightly from the \$4,529,328 or \$1.57 a share earned in the June quarter this year, it was a large gain over the \$2,788,053 or 61c. a share earned in the third quarter last year. Net income for the nine months ended Sept. 30, 1928, totaled \$12,186,974, compared with \$13,454,771 in the first nine months of 1927 and with \$15,764,851 in the corresponding period of 1926.

Although the earnings for the first

three quarters this year are the lowest in three years, this does not indicate a decline in the full year's net, as the last quarter of 1927 was the lowest of the year and this year it seems likely to be the highest. In commenting on the situation, President Eugene G. Grace states that current operations are at approximately 94 per cent of capacity, the highest in the company's history, and that the price situation at the end of the third quarter was decidedly better than at the end of the second. Billing prices in the third quarter had shown no important change from the second but the benefit of the price advances on the

Earnings of United States Steel Corporation

EARNINGS IN RECENT YEARS			
Quarters	1928	1927	1926
1st	\$40,934,032	\$45,584,725	\$45,061,285

Surplus for the quarter	\$11,127,929

heavier products is now being felt and should be reflected in fourth quarter shipments.

Unfilled orders, as of Sept. 30, 1928, amounted to \$58,725,602, representing bookings of 634,000 tons, as compared with \$51,761,908 or 515,000 tons on June 30, and with \$52,321,794 or 419,000 tons on Sept. 30, 1927.

Other Companies Not Up to 1926 Totals

Other large steel companies, as the accompanying table shows, in most cases earned more in the first nine months this year than in the corresponding period of 1927, but failed to equal their figures for the first three quarters of 1926. However, nearly all the companies show satisfactory returns in the past quarter and indicate recovery from the slump of 1927.

Colored plug fuses for electric light circuits, a color for every size, have been put on the market by the Trico Fuse Mfg. Co., Milwaukee.

Comparison of Earnings of Leading Steel Companies

(In Thousands of Dollars)

Company	Third Quarter 1928	Second Quarter 1928	Third Quarter 1927	First 9 Mo. 1928	First 9 Mo. 1927	First 9 Mo. 1926

Iron and Steel Markets

Railroad Demand Expanding

Rail Purchases and Equipment Programs May Offset

Tapering Steel Requirements of Automobile Industry

—Pig Iron Prices Still Rising

IMPENDING purchases of railroad equipment and seasonal orders for rails, a sustained demand for pig iron that has forced prices to still higher levels and further signs of strength in finished material, particularly bars, are encouraging features of the iron and steel market.

Developments of the week, however, do not all point in the same direction. The steady advance in heavy steel scrap at Pittsburgh, which began in July, has been interrupted by a 25c. a ton decline. Further evidences of the tapering operations of the automobile industry have been brought to light, and a gradual reduction of mill backlogs with a corresponding shortening of deliveries is indicated.

Steel production, however, holds at close to 90 per cent, and pig iron output has reached a record rate for the year.

Telegraphic estimates of pig iron production for October collected by THE IRON AGE indicate a total of 3,373,000 gross tons for the 31 days, or 108,800 tons per day. The daily output exceeds that of September by 6.5 per cent and is the highest in 17 months. It was also the best average for October reached in any year except 1918 and 1916.

Of particular interest in the steel trade are accumulating indications that diminishing demands from some consumers are likely to be offset by heavier demands from others.

The seasonal rail buying movement brought out orders during the week for 159,600 tons from the Pennsylvania and 50,000 tons from a Western road. The St. Paul is in the market for 50,000 tons, and early inquiries are expected from the Burlington, the North Western and the Illinois Central. While rail orders may be smaller than last year, options on additional tonnage are likely to be proportionately larger, as was the case with the Pennsylvania.

Railroad equipment inquiries include one for 3000 cars from the Missouri Pacific. Buying programs to be launched after election call for upward of 40,000 cars, more than half of which are likely to be placed before the close of the year. Freight car orders so far this year have totaled less than 30,000 cars, the poorest showing since 1921.

Another outlet for steel that is reopening is shipbuilding, which is being stimulated by the Merchant Marine act. The steel required for five vessels to be built on the Atlantic seaboard totals 17,200 tons.

Fabricated steel awards, including an informal contract for 11,300 tons for New York subways, aggregate nearly 42,000 tons, the largest total in six weeks.

Automobile output, although undergoing a seasonal decline, is nevertheless higher than usual for this time of the year. Steel orders for the new Chevrolet model have been delayed a week or two, but the demands of the Ford company are increasing in conformity with a steady gain in output, which has now reached more than 5500 units daily.

Shipments of finished steel exceed bookings in virtually all districts except Chicago. Pressure for deliveries is heavy in both the Cleveland and Chicago districts, specifications in the latter market having been the largest for any week this year.

Finished steel prices are strong in most centers, with steel bars well established at 1.95c., Pittsburgh, or \$1 a ton above the recent minimum. Despite occasional shading on black sheets in the East, most reports indicate a firm sheet market, with advances of \$2 to \$3 a ton for next quarter a probability.

The tin plate price for the first half of 1929, soon to be named, is unlikely to show any change from the present quotation of \$5.25 per base box, Pittsburgh.

The upward swing of pig iron prices has not yet been halted. In the Chicago, Valley and Buffalo markets all grades went up 50c. a ton. At Philadelphia, basic pig iron rose 25c. a ton on a 10,000-ton sale. A scarcity of basic grade is particularly pronounced in the Valleys. Sales of foundry and malleable iron at Cleveland totaled 42,000 tons, compared with 38,000 tons the previous week. Furnace stocks of merchant iron have been sharply reduced.

The reaction in scrap prices at Pittsburgh, although interpreted there as reflecting less urgent demands on the steel mills, finds little support in other important market centers. Although a less buoyant situation is reported at Youngstown and Philadelphia, stronger prices are the rule elsewhere, with heavy melting scrap 50c. a ton higher at Chicago and Cleveland and 25c. higher at St. Louis.

Spot furnace coke prices at Connellsville, although unchanged, are growing easier in keeping with an increase in available supplies of the fuel.

Exports of iron and steel in September, although 20 per cent below those of August, were 39 per cent larger than a year ago. Exports in the first nine months, excluding scrap, showed a gain of 14½ per cent over the same period in 1927.

THE IRON AGE composite price for finished steel has advanced from 2.362c. to 2.369c. a lb., the highest figure since June, 1927. The pig iron composite has risen from \$17.92 to \$18.25 a ton—the first time it has been above \$18 in more than a year.

Pittsburgh

Steel Operations Unaffected by Slight Letup in Urgency of Demand—Pig Iron Up 50c.—Scrap Easier

PITTSBURGH, Oct. 30.—In a general way, incoming business in steel is falling behind shipments, but the difference has been too slight to affect either steel works or rolling mill operations, which at the close of October are not far from the high point of about the middle of the month. Rail business now reaching the mills in rather good volume is clear gain, since at this time of the year shipments of rails do not amount to much. In strips and sheets, there is almost a balance between shipments on old orders and fresh tonnage releases. In bars, plates and shapes, shipments are drawing pretty heavily against backlogs, this being apparent less in mill operations than in the ability of manufacturers to promise more prompt deliveries than they would a few weeks ago.

There is still a strong hope that the railroads will buy cars and locomotives, but it still is a hope largely unrealized. Cheerful reports from the oil industry possibly mean an improved demand next spring for oil well pipe, but right now there is only moderate activity in that product, even seamless pipe having slipped some in demand in the past week or two. It is commonly accepted that automotive industry's requirements will be smaller in November and December than they have been over most of the year to date.

Taking all factors into the picture, and adding the fact that with the approach of the end of every year there is some influence upon demand in inventory considerations, the common opinion is that the high point of fall activity has been reached and passed. But there is no expectation of a big recession from current levels.

The scrap market has stopped ad-

vancing in the past week and has eased a little both as to offerings and prices. This probably reflects the passing of the urgency in the demand for steel and consequently in the need of driving production to the limit.

The shortage of available supplies of basic iron has found reflection in a price advance of 50c. a ton, with a sale of 10,000 tons and several other good-sized tonnages in prospect. All grades of iron have moved up 50c. a ton in the past week, but sales and demand count less heavily in foundry, malleable and Bessemer grades than in basic iron, the merchant production of which is moderate, while steel companies do not seem to care to part with any surplus supplies they may have.

There is a very firm tone to the steel market. Bars are clearly quotable at a minimum of 1.95c. On new business, strip makers want much more than they are getting on most of the current contract shipments. Sheet makers not only are firm at current prices, but are beginning to talk about higher prices on first quarter contracts.

Pig Iron.—A horizontal advance of 50c. a ton has been definitely established in pig iron prices in this market. One sale of 10,000 tons of basic iron has been made by a Valley producer for shipment to an Ohio steel company at \$17.50, furnace, or \$19.15, delivered, the freight from shipping point being \$1.65 per ton. The delivered price is equal to \$17.89 at either Youngstown or Cleveland, as the freight rate from those points to the destination of this tonnage is \$1.26 per ton. Besides numerous smaller lots, there has been a sale of 1500 tons of No. 2 foundry iron at \$17.50, Valley furnace. The support in sales of the advance in Bessemer and malleable grades is less imposing than that in the other grades, and the principal factor in the higher prices is the smallness of current production available for open market sale. There is more interest on the part of melters in basic iron than in the other grades, although a considerable tonnage of foundry iron for shipment over the next three or four months is included in total bookings of 75,000 tons reported by one merchant producer as the business of the past month. The Edgewater Steel Co. has inquired for 2000 to 4000 tons of basic iron for December-January shipment. It is said that the Sharon Steel Hoop Co., in preparation for the blowing out of its own furnace at Lowellville, Ohio, is seeking a round tonnage of basic iron, and it is generally believed that the Central Alloy Steel Corporation will buy more. The Valley steel manufacturers seem to have no basic iron for sale, and that also is the situation with Pittsburgh district companies, which ordinarily make more than their own requirements. Merchant production of basic iron is somewhat larger than it has been, as the Claire furnace, Sharpsville, Pa., now is running on that grade. It is reported that preparations are being made for starting the Struthers furnace, Struthers, Ohio; owners have secured an option on some ore and the work of repairing and relining the furnace is under way with an idea of blowing in about Dec. 15. The Jones & Laughlin Steel Corporation has put on the one

idle Eliza furnace and now has all furnaces except the Soho stack in production.

Prices per gross ton, f.o.b. Valley furnace:

Basic	\$17.50 to \$18.00
Bessemer	18.00
Gray forge	17.00
No. 2 foundry	17.50
No. 3 foundry	17.00
Malleable	18.00
Low pnos., copper free	26.50 to 27.00

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Hot-Rolled Flats.—Incoming business in strips is almost equal to shipments and both still are on a high scale. Demands for the Ford Motor Co. are very heavy, and, while little steel is moving to the maker of another low-priced car, it is figured that merely the production of dealers' displays of a new model will give heavy impetus to the steel requirements of this builder. The new base prices and the new card of extras now are being quoted by almost all makers, but only a small amount of business has been written on the new schedules, owing to the fact that so many consumers are covered on their requirements for the remainder of this year. On such new business as is developing, the card which produces the highest price is used by some makers, whose need of additional business is not pressing.

Cold-Rolled Strips.—Shipments are very heavy and so is incoming business. Several producers find tonnage releases substantially equal to shipments on older orders. Makers are holding firmly to 2.85c., base Pittsburgh, on new business.

Ferroalloys.—Makers of ferrosilicon have announced a continuance of this year's prices for 1929, or \$83.50 for 50 per cent and \$130 for 75 per cent on contracts. No advance is expected on ferrophosphorus for shipment next year. Ferromanganese also is to continue at its present price on 1929 contracts. Deliveries are good against existing contracts in keeping with the high rate of steel works operations, but there is no rush on the part of consumers to sign contracts for next year. In view of a guarantee against a decline in the price of ferromanganese, it is not surprising that buyers are slow to cover.

Semi-Finished Steel.—The market

is quite firm at \$33, Pittsburgh and Youngstown on billets, slabs and sheet bars. On a few small lots of billets, which had to be delivered more promptly than most makers could promise, \$34, Pittsburgh, was obtained. This price, however, was largely a delivery premium price as consumers generally are getting good deliveries on contracts, some of which are for third quarter and carry the lower price that ruled in that period. Specifications generally are in keeping with the fact that sheet and strip mill operations are averaging close to physical capacity. Wire rods are steady at \$42, base Pittsburgh or Cleveland, and are moving well.

Bars, Plates and Shapes.—Bars now appear to be unobtainable at less than 1.95c., base Pittsburgh, and that is as low as some makers will go on new business in plates and shapes, but strengthening of prices is not as complete in the two latter products as in bars, because of variations in the order books and the size of the current demands. Mills at no time have been as heavily obligated on plates as on either shapes or bars and have had better bookings of bars than shapes. It is, therefore, natural that bar prices should show strength in advance of the other products. Bars are quotable at 1.95c. to 2c., but 1.90c. has not disappeared on desirable tonnages of plates and shapes. It is generally believed that an effort will be made to further stiffen prices on first quarter business. In new demands and specifications, bars make a better showing than shapes and plates. Demand for fabricated steel is rather dull.

Rails and Track Supplies.—Rail bookings of the local mill have been further enhanced by the distribution of the Pennsylvania Railroad orders for a total of 159,600 tons. There has not been a corresponding gain in bookings of the track fastenings, as the railroads now follow a policy of ordering spikes, tie plates, etc., when track laying starts. Light-section rails are very quiet and small spikes are dull.

Wire Products.—In a general way, business is making a favorable show-

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 down to and including 2½ in. squares, the price is \$5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a \$5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

Rails

Per Gross Ton

Carbon, 0.30% to 0.40%, base.....	50
Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.....	

ing in comparison with other years at this season. Prices are firm, but there is still a lack of uniformity in the application of the extra 10c. per keg in carload lots of nails to others than jobbers.

Tubular Goods.—Line pipe still forms the bulwark of mill operations. While there are reports of improvement in the oil market, this development has not yet been translated into increased oil well pipe demands. Seamless pipe, which recently was so active for this purpose, particularly for shipment to California, is quieter and lapwelded oil country pipe still is very slow. Buttwelded pipe is moving very steadily, but individual orders are small. The Milwaukee maker of electrically welded pipe is reported to have taken 140 miles of 12 in. pipe for a line from the Jennings field in Zapata County, Tex., to Monterey, Mexico, for the Houston-Gulf Gas Co. In tubing, there is a fairly good movement of merchant tubes and a really good one in mechanical tubing.

Sheets.—There is no material let-down in the demand for sheets, and price ideas of producers are growing stronger. No great difficulty attends sales of black sheets at 2.75c., base, blue annealed at 2c., base, and galvanized at 3.50c., in which incidentally some effort is being made to eliminate the jobbers' preferential of 10c. per 100 lb. Higher prices are mentioned on first quarter business, with a possibility that an advance of \$3 will be sought on black and galvanized sheets and a \$2 a ton advance over present prices of body and blue annealed sheets. Mill operations remain well up toward physical capacity.

Tin Plate.—The recession in demand and mill operations appears to have ended and, while the market is far from active, it is doing better in both sales and mill engagement than it did recently. As the time approaches for the naming of 1929 first

half prices for tin plate, it is becoming apparent that the present price of \$5.25 per base box, Pittsburgh, for coke tin plate will be continued.

Cold-Finished Steel Bars and Shafting.—Specifications for this month will show some loss as compared with September, but in view of the heavy releases last month and the fact that specifications this month were against fourth quarter contracts carrying an advance of 10c. per 100 lb., it was expected that buyers would be cautious. Buyers generally appear to have accepted the advance, but it was not until about a week ago that 2.10c., base, disappeared.

Coke and Coal.—Spot furnace coke prices are the same as a week ago, but supplies are somewhat more ample and more sales are being made at the lower than at the higher limit of the price range. Producers are talking strongly as to prices on first quarter contract tonnages, because of the strong pig iron situation. There is the possibility of a good-sized order for coke for the Struthers Furnace Co., which is likely to be blown in in December. The Jones & Laughlin Steel Corporation has escaped the necessity of buying coke for the latest addition to its active blast furnace by firing some of the rectangular ovens at its Aliquippa works. Foundry coke is moving well both in spot sales and in specifications on contracts. There is too much coal for prices to show much strength. Prices are weak even on household fuel, which is in good demand, and prices are off 25c. a ton from those of a month ago. Slack coal still is a drug on the market.

Old Material.—The market has a slightly easier tone in the steel works grades, and heavy melting steel this week is quotable at \$17.50 to \$18, against \$18 a week ago. Failure of the Steel Corporation to purchase, as was expected a week ago and its decision again yesterday to defer purchases, has exerted considerable influence upon dealers, as has also the fact that another Pittsburgh district steel company, which bought very little scrap during the rise from \$14 to \$18 in heavy melting steel and was expected to be a buyer, now appears to have escaped the necessity of purchasing. It is still hard for dealers to pick up large tonnages, but on the other hand there are definite tenders of heavy melting steel at \$17.75. Melters generally are out of the market and, with less pressure for deliveries, dealers are not scrambling so urgently for supplies. Compressed sheets command the same prices as heavy melting steel and that also is the situation in Youngstown, where \$18.50 was paid for both steel and compressed sheets. Turnings are slightly firmer and some rather high prices have been paid for single carloads of steel car axles for quick shipment, which have gone at \$22.50 in such cases, or 50c. to \$1 a ton above what can be obtained on orders for later delivery. The November scrap list of the Baltimore & Ohio Railroad

contains 10,200 and the Pennsylvania Railroad list contains approximately 40,000 gross tons.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:

Heavy melting steel.....	\$17.50 to \$18.00
Scrap rails	17.00 to 17.50
Compressed sheet steel....	17.50 to 18.00
Bundled sheets, sides and ends	15.50 to 16.00
Cast iron carwheels.....	15.25 to 15.75
Sheet bar crops, ordinary..	18.00
Heavy breakable cast.....	14.00 to 14.50
No. 2 railroad wrought....	18.00
Heavy steel axle turnings..	15.00 to 15.50

Acid Open-Hearth Grades:

Railr. knuckles and couplers	19.00 to 19.50
Railr. coil and leaf springs	19.00 to 19.50
Roller steel wheels.....	19.00 to 19.50
Low phos. billet and bloom ends	20.50 to 21.00
Low phos., mill plates.....	19.00 to 19.50
Low phos., light grade.....	18.00 to 18.50
Low phos., sheet bar crops	19.00 to 19.50
Hvy. steel axle turnings...	15.00 to 15.50

Electric Furnace Grades:

Low phos. punchings.....	18.50 to 19.00
Hvy. steel axle turnings...	15.00 to 15.50

Blast Furnace Grades:

Short shoveling steel turnings	12.50 to 12.75
Short mixed borings and turnings	12.50 to 12.75
Cast iron borings.....	12.50 to 12.75
No. 2 busheling.....	11.25 to 11.75

Rolling Mill Grades:

Steel car axles.....	21.00 to 22.00
No. 1 railroad wrought...	13.50 to 14.00
Sheet bar crops.....	18.00 to 18.50

Cupola Grades:

No. 1 cast.....	15.50 to 16.00
Rails 3 ft. and under.....	18.00 to 18.50

McClintic-Marshall Co. Buys Buffalo Shop

The McClintic-Marshall Co. has acquired from the Bethlehem Steel Co. the Lackawanna Bridge Co., Buffalo, and has incorporated the plant as the McClintic-Marshall Co. of Buffalo. This fabricating shop was acquired by the Lackawanna Steel Co. before the latter was absorbed by the Bethlehem Steel Co. With the acquisition of this unit, the McClintic-Marshall Co. now has structural steel fabricating plants at Buffalo, Pottstown, Pa., Pittsburgh, Chicago and Los Angeles.

To Review Progress in Gas Welding

International Acetylene Association will hold its twenty-ninth annual meeting at the Congress Hotel, Chicago, Nov. 14, 15 and 16. The first day will be given over largely to committee activities. A feature of a later session will be an address by Prof. C. F. Keel of Basle, Switzerland, who will review the European practices in generating, handling and utilizing acetylene gas. A comprehensive series of reports on the use of oxy-acetylene welding in American industries will also be presented. Meetings on Nov. 15 will be held jointly with Gas Products Association.

The executive offices of the Boston Bridge Works, Inc., Boston, formerly at 47 Winter Street, are now at the company's works, Sixth and Binney Streets, Cambridge, Mass.

Milled studs	70 and 5

Chicago

Steel Demands Hold to a High Level—Pig Iron Prices Advanced 50c. a Ton

CHICAGO, Oct. 30.—Miscellaneous users of steel, finding needs larger and mill deliveries less certain and more extended, have issued heavy specifications, with the result that the past week was one of the most active of the year. A part of this tonnage is attributed to an active spot rail business and in a small measure to the beginning of shipments against 1929 rail orders. Nevertheless, industry as a whole is reaching a higher level in production. Quantities of steel used by the automobile manufacturers have lessened but are still large, while agricultural implement makers are making heavier drafts against contracts. The use of forgings is expanding and more diversified, and local forge shops are holding to capacity output.

Sales of finished steel products are well up to the average of the past four weeks. The bulk of this tonnage is for nearby requirements, that is 30 to 60 days, which is the range of deliveries of plates, shapes and bars. The total volume of contracts for fourth quarter is larger than in the preceding three months.

Structural steel awards total 3000 tons and fresh inquiry is for 5000 tons. In Chicago, several municipal projects will come before voters in November.

Railroad equipment orders are light, but there are indications that the Santa Fe, the Wabash, the Illinois Central and the Chicago & North Western will soon announce car building programs.

Steel mill output remains steady at 85 per cent of capacity.

Pig Iron.—An advance of 50c. a ton on foundry, malleable and high phosphorus pig iron has been put in effect, making foundry iron \$19.50 for the base grade and \$20 for the No. 1 grade and malleable and high phosphorus \$19.50. Total shipments in October are equal to, if not heavier, than those of the best previous month this year. Spot orders are numerous, many of them for fill-in tonnages for delivery over the remainder of the year. Several additional first quarter contracts have been placed, a Michigan user having ordered 4000 tons. The Chicago market is in the best position in about five years; stocks in the hands of users and producers are low and the demand is consistent and heavy. There is a possibility that the Mayville furnaces, now held in reserve, may be lighted. Reports are denied that basic iron is reaching Chicago by boat. That a shortage exists, however, is apparent because an order for 5000 tons has been turned down by a local producer.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25..	\$19.50
N'th'n No. 1 fdy., sil. 2.25 to 2.75..	20.00
Malleable, not over 2.25 sil.....	19.50
High phosphorus	19.50
Lake Super. charcoal, sil. 1.50.....	27.04
So'th'n No. 2 fdy. (all rail).....	22.26
Low phos., sil. 1 to 2, copper free	\$29.00 to 29.50
Silvery, sil. 8 per cent.....	29.79
Bess. ferrosilicon, 14-15%.....	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—Many contracts for 50 per cent ferrosilicon for 1928 have been closed, and some users are plac-

ing orders for next year's requirements of ferromanganese. One contract for ferromanganese is for 2500 tons. Spiegeleisen is quiet.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$88.50; spiegeleisen, 19 to 21 per cent, \$40.76.

Plates.—It is reported here that the Missouri Pacific has definitely entered the market for 3000 freight cars, requiring close to 45,000 tons of plates, shapes and bars. The Rock Island, following closely on its inquiry for 2750 freight cars, is now in the market for 15 70-ft. suburban cars and the trade believes that this number will be increased before orders are placed. Among purchases this week are 300 refrigerators ordered from the Pullman Car & Mfg. Corporation by the Northern Refrigerator Co. The Chicago & North Western has inquired for 400 gondolas and will come out for additional cars in a few days. Chicago producers have taken orders for 5500 tons of plates for oil storage tank construction in the Southwest and 6000 tons is on inquiry from that section of the country. Plate mills are well engaged on miscellaneous orders and the needs of structural shops. Deliveries range from three to four weeks.

Mill prices on plates, per lb.: 2c. to 2.10c. base Chicago.

Bars.—Demand for mild steel bars is steady and deliveries range from four to six weeks. Forgers in the Chicago district are operating at close to capacity. The lessened demand from manufacturers of automobiles has been offset by an expansion of uses in other directions, notably builders of heavy machinery and machine tools. Owing to the character of this heavier work, some shops are finding that output is at the rate of 120 per cent of capacity as gaged by normal production when turning out automobile parts. Automobile schedules now made out for 30 days indicate a uniform demand for bars from that source. Mild steel bar prices are steady at 2c. to 2.10c. per lb., Chicago. No change is reported in the iron bar market, in which prices are steady at 2c. to 2.10c., Chicago. A fair volume of spot buying in alloy bars is noted and specifications are such that local

mills are shipping at a rate close to 85 per cent of capacity. Expansion of miscellaneous uses has in part offset the drop in demand from manufacturers of automobiles. Specifications for rail steel bars are lighter as the month comes to a close. Total shipments, however, in October compare favorably with the best month this year. Orders for fence posts are light because buyers are awaiting the announcement of spring terms on Nov. 6.

Mill prices per lb.: Soft steel bars, 2c. to 2.10c., base, Chicago; common bar iron, 2c. to 2.10c., base, Chicago; rail steel bars, 1.95c., base, Chicago Heights mill.

Cast Iron Pipe.—The Chicago cast iron pipe market continues to mark time. A sprinkling of car lot orders are being placed from day to day, and on that kind of business prices are steady at \$36 to \$37, Birmingham, or \$44.20 to \$45.20, delivered Chicago, for diameters 6 in. and larger. Akron, Ohio, will receive tenders on 500 tons of 12 and 16-in. pipe. Shipments against old orders continue heavy, as contractors face cold weather in a few weeks. Several contractors' jobs which sellers had expected would develop are still in the formative stage, with the outlook unfavorable for orders because of the nearness of winter weather. Deliveries are prompt on all common sizes.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, \$44.20 to \$45.20; 4-in., \$48.20 to \$49.20; Class A and gas pipe, \$4 extra.

Structural Material.—Structural shops in this district are well engaged, and specifications issued by them are for liberal quantities of steel. The new Chicago Postoffice is brought a step nearer by the announcement that a local firm of architects will prepare the plans. A bridge at Duluth requiring about 2000 tons will be re-advertised, according to advices received here. The American Bridge Co. was low bidder on the first figures taken, but bids for the complete structure are said to have overrun the money available.

Mill prices on plain material, per lb.: 2c. to 2.10c. base, Chicago.

Wire Products.—Specifications from the manufacturing trade are holding to the level of the past few weeks. Automobile builders are taking smaller quantities, partly because this is the season when demand for motor cars slackens and partly because several of the largest makers are changing models. Several automobile plants expect to resume heavier operations about the middle of November. Lighter shipments to automobile centers are partly offset by increased demand from a wide circle of scattered industries. In fact, the net loss in deliveries to the manufacturing trade is not discouraging to sellers. The jobbing trade presents a different picture; the expected increase in fall trade has not come. Especially disappointing has been the scarcity of woven wire fencing orders; normally, this is an active season for this commodity. Orders for nails are few in number and usually of small size, supporting output not above 20 per cent of capacity. Business in the South

shows little change, while orders from the Northwest are in smaller total tonnage. Wire mill output is steady at 65 per cent of capacity.

Rails and Track Supplies.—The Pennsylvania Railroad has distributed orders for 159,600 tons of standard-section rails as follows: 46,900 tons to Carnegie Steel Co., 31,300 tons to Illinois Steel Co., 71,900 to Bethlehem Steel Co., and 9500 tons to Inland Steel Co. Other purchases include 50,000 tons ordered for 1929 shipment to a Western railroad and several miscellaneous lots for immediate delivery. Scattered orders for nearby shipment and small releases against 1929 contracts are holding Chicago rail mills at an output that averages not far from 50 per cent of capacity. Several railroads have ordered a total of 3000 tons of track supplies for shipment this year. Fresh inquiry for future delivery totals 62,000 tons, including 50,000 tons for the Chicago, Milwaukee, St. Paul & Pacific. It is reported that the Illinois Central, the Chicago & North Western and the Burlington will soon follow with inquiries for tonnages approximately equal to their 1927 purchases.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Reinforcing Bars.—Moderate activity again marks the reinforcing bar market. Shop operations are spotty, some being as low as 50 per cent of capacity. Some shops are experiencing trouble in getting mill shipments satisfactory for their delivery schedules. Shipments are pointing downward and this, combined with the approach of winter, is making sellers anxious for work. The result is a further softening of prices on all quotations except those for small tonnages. Recent orders have been taken for rail-steel reinforcing bars at 1.85c., Chicago warehouse, and on attractive tonnages 2.10c. a lb. is not uncommon for the billet bar commodity. It is reported that a round tonnage will be

needed for a plant addition to the Stewart Warner Speedometer Corporation, Chicago.

Coke.—Chicago delivered prices are firm at \$8.75 and oven quotations are \$8. Shipments to foundries are heavy.

Old Material.—Dealers are asking \$15 a gross ton, delivered, for heavy melting steel. Brokers' trades range from \$14.75 to \$15 a ton. On the whole, this market is strong except in steel axles, the supply of which is far ahead of demand. Cast iron borings have gone up 50c. a ton on sales totaling more than 5000 tons. Sellers are asking higher prices for railroad malleable, which is scarce. Cast iron wheels are in active demand in small lots and readily bring 50c. a ton more than last week. Stocks in the hands of large users are of moderate size in spite of the volume of recent shipments, which in some cases have overtaxed unloading facilities at local plants. The St. Paul is offering 5000 tons of rerolling rails and the Burlington will dispose of 4700 tons of miscellaneous scrap.

*Prices deliv'd Chicago district consumers:
Per Gross Ton*

Basic Open-Hearth Grades:	
Heavy melting steel.....	\$14.50 to \$15.00
Shoveling steel.....	14.50 to 15.00
Frogs, switches and guards, cut apart, and misc. rails	15.50 to 16.00
Hydraulic compressed sheets	12.50 to 13.00
Drop forge flashings.....	10.00 to 10.50
Forg'd, cast and r'd steel carwheels	17.25 to 17.75
Railr'd tires, charg. box size	17.25 to 17.75
Railr'd leaf spring cut apart	17.25 to 17.75
Acid Open-Hearth Grades:	
Steel couplers and knuckles	16.00 to 16.50
Coil springs.....	18.25 to 18.75
Electric Furnace Grades:	
Axle turnings.....	14.00 to 14.50
Low phos. punchings.....	16.00 to 16.50
Low phos. plate, 12 in. and under	15.50 to 16.00
Blast Furnace Grades:	
Axle turnings.....	11.50 to 12.00
Cast iron borings.....	11.50 to 12.00
Short shoveling turnings...	11.50 to 12.00
Machine shop turnings...	7.25 to 7.75
Rolling Mill Grades:	
Iron rails.....	14.75 to 15.25
Rerolling rails	16.50 to 17.00
Cupola Grades:	
Steel rails less than 3 ft..	17.50 to 18.00
Angle bars, steel.....	16.50 to 17.00
Cast iron carwheels.....	14.25 to 14.50
Malleable Grades:	
Railroad	15.75 to 16.25
Agricultural	12.50 to 13.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heav.	26.00 to 31.00
Per Net Ton	
Rolling Mill Grades:	
Iron angles and splice bars	14.50 to 15.00
Iron arch bars and trans- oms	20.50 to 21.00
Iron car axles	25.50 to 26.00
Steel car axles	15.50 to 16.00
No. 1 railroad wrought...	12.75 to 13.25
No. 2 railroad wrought...	13.00 to 13.50
No. 1 busheling.....	11.00 to 11.50
No. 2 busheling.....	6.00 to 6.50
Locomotive tires, smooth...	13.00 to 13.50
Pipes and flues.....	9.50 to 10.00
Cupola Grades:	
No. 1 machinery cast....	15.50 to 16.00
No. 1 railroad cast.....	14.50 to 15.00
No. 1 agricultural cast....	14.00 to 14.50
Stove plate.....	11.75 to 12.25
Grate bars.....	12.50 to 13.00
Brake shoes	11.75 to 12.25

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Sheets.—Prices for these commodities remain strong, and there is still talk among the trade of an advance. Specifications are fully equal to shipments, which represent close to 85 per cent of hot mill capacity. Deliveries to the roofing trade are light, but improvement in this situation is looked for in November, when roofing materials are used in greater quantities in the South. New buying is in small volume and backlogs are steadily being reduced. Many buyers have specified close to their full contract obligations and sellers believe that a round tonnage will be needed to fill out the fourth quarter. Sheets are moving rapidly through jobbers' hands, as shown by shipments from mills to that trade. Agricultural implement manufacturers are using large quantities of sheets, and their specifications against contracts that have been placed in the last 30 days are heavy.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.90c.; No. 24 galv., 3.65c.; No. 10 blue ann'l'd, 2.15c. Deliv'd prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Bolts, Nuts and Rivets.—Specifications are measurably heavier. Producers, especially those who furnish bolts, nuts and rivets to manufacturers of agricultural machinery, find that operations at 65 per cent of capacity match closely with shipments. Output for the industry averages well over 60 per cent, and some producers have expanded to 70 per cent of capacity. Prices are firm for all commodities.

Industrial Power Plant for 1800 Lb. Steam Pressure

A boiler and power plant designed for 1800 lb. steam pressure is to be erected for the Philip Carey Mfg. Co., Cincinnati, manufacturer of asbestos and magnesia high-pressure steam pipe insulation, at its Lockland, Ohio, works. W. E. S. Dyer, consulting engineer, Philadelphia, will design and have charge of the construction. The high-pressure steam generating equipment will be furnished by Combustion Engineering Corporation, New York. Integral economizers, water-cooled furnace walls, air preheaters, superheaters and pulverized fuel equipment will comprise the units.

The main generating units will consist of two 5000-hp. vertical triple expansion, direct connected engines, operating with 1400 lb. pressure at the throttle, at a temperature of 800 deg. Fahr., and exhausting against 60 lb. back pressure above the atmosphere. To each engine will be direct connected a three-phase alternator. All the equipment for this plant will be placed with American manufacturers, except the main engines, which will be furnished by A. Borsig, Berlin, Germany. The operating cycle of this plant is expected to make it one of the most efficient steam plants in the world.

Philadelphia

Pennsylvania Railroad Orders 159,600 Tons of Rails—10,000 Ton Sale of Basic Pig Iron at \$20, Delivered

PHILADELPHIA, Oct. 30.—Steel deliveries are becoming less extended, most mills offering shipments in 10 days to two weeks, compared with two and three weeks or more early in the month. The past week has brought a slight lull in buying, but shipments on contracts continue in good volume. Bar mills are still heavily booked ahead and in a slightly stronger position on tonnage than the plate, structural or sheet mills. Plate prices show some irregularity, depending upon the position of the individual producer, so that prices range from 2.05c. to 2.15c., Coatesville. Black sheets still show occasional concessions of \$1 a ton from 2.75c., Pittsburgh. The Pennsylvania Railroad has placed its 1929 rail requirements, totaling 159,600 tons, of which 71,900 tons went to the Bethlehem Steel Co., 9500 tons to the Inland Steel Co., and 78,200 tons to Steel Corporation mills. Some sizable plate buying is in prospect by shipyards, which are bidding for contracts or have received awards for new ship construction.

Pig Iron.—Quotations on foundry iron are still from \$20 to \$20.50 per ton, furnace, for delivery to the end of this year and \$20.50 per ton, minimum, for first quarter shipment. Some small contracts for the next quarter are reported and a moderate volume of inquiry. Low phosphorus demand continues good, and prices are strong but unchanged. Basic iron shows a further advance on a sale of 10,000 tons at \$20 per ton, delivered. The Coatesville user of basic, inquiring for about 20,000 tons, has not yet bought.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.....	\$20.76 to \$21.26
East. Pa. No. 2X, 2.25 to 2.75 sil.....	21.26 to 21.76
East. Pa. No. 1X.....	21.76 to 22.26
Basic (del'd east. Pa.)....	19.75 to 20.00
Gray forge.....	19.75 to 20.25
Malleable.....	21.00 to 21.50
Stand. low phos. (f.o.b. N. Y. State furnace)....	22.00 to 23.00
Cop. b'rg low phos. (f.o.b. furnace).....	23.00 to 23.50
Va. No. 2 plain, 1.75 to 2.25 sil.....	24.54
Va. No. 2X, 2.25 to 2.75 sil.....	25.04

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to \$1.64 from eastern Pennsylvania furnaces; \$4.54 from Virginia furnaces.

Ferromanganese.—Domestic and British producers have opened their books for next year and the domestic makers report a substantial tonnage booked at \$105 per ton, seaboard, quoted for delivery throughout the year. British makers have not yet closed many contracts, although they have announced \$105 per ton, seaboard, as the 1929 price.

Bars.—Deliveries are slightly less extended than a few weeks ago, but still range from 10 days to about three weeks, depending upon the sizes specified. Bar mills are generally in a stronger position on tonnage than plate, shape or sheet producers, and no concessions from 1.95c. to 2c., Pittsburgh, or 2.27c. to 2.32c., Philadelphia, are reported on new business.

Shapes.—Quotations are on a basis of mill nearest to consumer, so that there is considerable absorption of freight rates in some instances. On most business the shape market continues at 2.05c., f.o.b. mill, or 2.11c. per lb., delivered Philadelphia, based on 2.05c., Pencoyd. Fabricators are well filled with tonnage and some de-

sirable projects are pending. The New York Shipbuilding & Dry Dock Co., Camden, N. J., has received the contract for a Grace Line vessel, which will probably require 1200 to 1300 tons of shapes.

Plates.—Although most mills are well booked, 2.15c., Coatesville, or 2.25c., Philadelphia, is not yet the minimum on new business. Preferred buyers are still able to obtain 2.10c., Coatesville, and occasionally there are transactions at 2.05c., Coatesville, or 2.15c., Philadelphia. Mills are offering slightly earlier delivery than a few weeks ago, shipments ranging from 10 days to two weeks. Some substantial plate tonnage is in prospect for shipbuilding, a Grace Line ship let to the New York Shipbuilding & Dry Dock Co., Camden, requiring about 3700 tons, and four vessels for the American Express Lines, which are still pending, about 13,500 tons. The fabricated pipe line at Lardner's Point may bring 6000 to 7000 tons of plates to an eastern Pennsylvania mill, if the contract for fabrication goes to a company in the East.

Sheets.—Except for continued reports of concessions of \$1 a ton to preferred buyers of black sheets, the market continues at 2.75c., Pittsburgh, or 3.07c., Philadelphia. Galvanized

sheets are unchanged at 3.50c., Pittsburgh, or 3.82c., Philadelphia, and blue annealed are quoted at 2c. and 2.10c., Pittsburgh, or 2.32c. and 2.42c., Philadelphia. Continuous mill sheets are still quoted at about 1.90c., Pittsburgh. New orders for sheets are small, and mill deliveries have receded to about two weeks or less compared with three to five weeks quoted at the beginning of the month.

Warehouse Business.—October purchases from stock have been slightly larger than those of September, but the month does not rank with the largest of the year. Prices are firm, and black and galvanized sheets are stronger, although small concessions are still evident, usually based on failure to quote the higher base price intended for small lots.

Imports.—In the week ended Oct. 27, 503 tons of pig iron arrived at this port from British India, 1401 tons of manganese ore from Chile, 750 tons of chrome ore from India and 30 tons of ferromanganese from the United Kingdom. Steel arrivals consisted of 106 tons of steel bars, 16 tons of shapes and 5 tons of steel bands from France, 709 tons of shapes, 9 tons of steel bars and 6 tons of bands from Belgium and 15 tons of strip steel from the United Kingdom.

Old Material.—Prices no longer show the strong undertone evident for some weeks, and brokers who are filling contracts report a good supply of certain grades at slightly lower buying prices. A dealer who is buying agent for a Phoenixville consumer has reduced his offers 25c. a ton and is quoting \$11.50 per ton for machine shop turnings, \$13 per ton, delivered, for yard grade of heavy melting steel and \$12.50 per ton, delivered, for stove plate. A sale of No. 1 cast scrap has been made at \$18 per ton, delivered, but it is understood to have been on a high freight rate. Chemical borings have brought \$16 per ton on a recent sale and No. 1 railroad wrought shows an advance of 50c. a ton to \$16.50 per ton on deliveries to a Lebanon, Pa., consumer.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel.....	\$16.00 to \$16.50
Scrap T rails.....	15.50 to 16.00
No. 2 heavy melting steel.....	13.00 to 13.50

New York

Large Car-Building Program in Prospect—Pig Iron Advance by Buffalo Furnaces Stimulates Sales

NEW YORK, Oct. 30.—Spot demand for pig iron remains active, indicating that melters rather generally are in need of supplementary tonnage. Sales in this territory for the week, which totaled more than 13,000 tons, were stimulated to some extent by a general advance of 50c. a ton to \$17.50, base Buffalo, on foundry iron for both current and first quarter deliveries. Politics, which has been without noticeable effect on business, is commencing to influence the attitude of buyers as election day draws near. While there is considerable interest in pig iron requirements for the first quarter, very little has been bought for that period, and it is evident that users are postponing action until election results are known. The Eastern Malleable Iron Co. has closed for 1500 tons of malleable, to be distributed among its plants at Naugatuck and Union City, Conn., Troy, N. Y., and Wilmington, Del. Low phosphorus pig iron is more active than for some time in both sales and inquiries. The Richardson & Boynton Co. has closed for a round tonnage of foundry iron for its Utica, N. Y., plant. The Foran Foundry & Mfg. Co., Flemington, N. J., is in the market for 1000 tons for November-December shipment. Abendroth Brothers, Port Chester, N. Y., are inquiring for 250 tons each of No. 2X and No. 1X for early delivery. An advance in the ocean freight rate on pig iron from Europe, effective Jan. 1, is expected to be announced next week. An increase of about \$1.25 in the ocean rate from India, effective on the same date, was recently made public. Importers have sold virtually their entire allotment of Indian iron for deliveries until about March 1, when the last shipments leaving the Orient prior to Jan. 1 will reach this country.

Freight rates: \$4.91 from Buffalo, \$1.39 to \$2.52 from eastern Pennsylvania.

*Price delivered to New Jersey cities having rate of \$3.28 a ton from Buffalo.

Plates, Shapes and Bars.—Definite assurance has been given to railroad car building companies by a number of railroads that they will come into the market before Jan. 1 or early in 1929 for large quantities of freight cars. It is estimated that inquiries for 40,000 to 50,000 cars are in sight, with the probability that more than half of these will be bought before the end of the year. Considering that the total number ordered in the first nine months of the year did not exceed

30,000, including about 5000 to be built in railroad companies' own shops, the present prospect is the most impressive that car builders have faced in more than a year. Car purchases so far in 1928 are the smallest since the war, excepting 1921, when only 23,000 cars were ordered. The peak year since the war was 1922, with orders for about 180,000 cars. It is known that some railroads have

their lists ready to submit to car builders for bids, but are awaiting the result of the national election. Three roads are mentioned as about to inquire for upward of 5000 cars each, another has a schedule of 4500 and several will inquire for lots ranging from 1000 to 3000. Local steel company offices report that specifications against contracts in October have held up at a high rate, but new business has declined. The total of specifications and new orders in the month has fallen somewhat behind the September figure. Prospects continue promising for large awards of structural steel. Not less than 15,000 tons in apartment house projects may soon be closed, having been held up pending the outcome of an appeal to the city administration for a change in the building code permitting the use of lighter sections for certain stresses. This appeal was denied. A leading fabricator has been awarded 11,300 tons of fabricated steel work for the New York subways. Steel bar prices are firmer at 1.95c. to 2c., Pittsburgh, 1.90c. having disappeared except to a few large contract buyers. Plates and structural shapes have not shown the strength of bars. The common prices on plates are 2.22½c. and 2.27½c., New York, while on shapes 2.19½c., New York, is quoted to large buyers, smaller buyers paying \$1 or \$2 a ton higher.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.29c. to 2.34c.; plates, 2.22½c. to 2.27½c.; struc. shapes, 2.19½c. to 2.22½c.; bar iron, 2.14c. to 2.24c.

Ferroalloys.—Announcement has been made by practically all sellers of ferromanganese that their books are open for 1929 at the unchanged quotation of \$105, seaboard basis. Some contracts have been made for next year, but this has not been general. Quotations for 1929 for 50 per cent ferrosilicon will also be unchanged at \$83.50 per ton, delivered, on contract and at \$88.50 for orders not covered by contract. There will be no change in next year's quotations for standard ferrochromium containing 65 to 70 per cent chromium and 4 to 6 per cent carbon, namely, 11c. per lb. of contained chromium. Business in spiegeleisen is confined to small lots; no announcement of 1929 prices has been made.

Cast Iron Pipe.—Seasonal quiet has set in, and current buying is limited to carload lots or less to complete pipe installations. Southern pipe makers continue to quote prices considerably higher than the bids of Northern foundries, but the latter have recently been advancing quotations. The low bid on 14,000 tons of pipe for Warwick, R. I., not yet awarded, is understood to have been \$36.40 per net ton on the 6-in. pipe, quoted by the Herbert Kennedy Co., New York, agent for the French maker. The lowest bid of an American maker on the 6-in. was \$43.50 per ton, delivered, submitted by the Warren Foundry & Pipe Co. The low bid on 1300 tons of water pipe for Herkimer, N. Y., was

submitted by the United States Cast Iron Pipe & Foundry Co.

Prices per net ton, deliv'd New York:
Water pipe, 6-in. and larger, \$35.60 to \$36.60; 4-in. and 5-in., \$40.60 to \$41.60; 3-in., \$50.60 to \$51.60; Class A and gas pipe, \$4 to \$5 extra.

Fluorspar.—Domestic users of foreign fluorspar have covered as heavily as possible against material already in this country or due to arrive before Nov. 19, when the increase in duty goes into effect. Some purchases were made at as low as \$15 per net ton, duty paid, but it is reported that this price was made on off-grade material and that standard spar brought \$16 in most instances. It will probably be some time before the market on foreign spar is again tested, but it is assumed that delivered prices will reflect the higher duty, at least in part.

Reinforcing Bars.—This market has been rather quiet in the last week. The tonnage booked was mostly in small lots. General contractors' bids will close tomorrow on the Delaware, Lackawanna & Western Railroad terminal warehouse at Jersey City, requiring about 8500 tons. Among the new projects announced is a bridge at East 238th Street, New York, which will take 250 tons, and a building in Manhattan for the Interborough News Co., for which the tonnage is being estimated. Prices are unchanged.

Warehouse Business.—The past month has been better than September with most jobbers, and in some cases warehouses report the largest month's business of the year. Demand for structural steel and bars continues large despite the advanced season. Black and galvanized sheets also are fairly active. While small concessions are still reported on sheets, prices are firmer than for several months.

Coke.—Standard furnace coke is firm at \$2.85 to \$3.05 per net ton, Connellsville, and foundry coke is unchanged at \$3.50 to \$3.75 per net ton, Connellsville. Standard brands remain at \$4.85 per net ton, ovens, or \$8.56 per net ton, delivered to north-

ern New Jersey, Jersey City and Newark, and \$9.44 per ton to New York and Brooklyn. By-product foundry coke prices are \$9 to \$9.40, Newark or Jersey City, and \$10.06, New York or Brooklyn.

Old Material.—Buying prices of brokers are beginning to show irregularity, recent sales of some grades justifying advances, while offers on other grades are slightly lower. Heavy breakable cast is being bought at \$16 per ton, delivered to a Harrisburg consumer, with a \$3.78 per ton freight rate from New York, and at \$16 per ton, delivered to a Florence, N. J., foundry, with a \$2.90 freight rate. No. 1 railroad wrought has been bought by a broker at \$16.50 per ton, delivered Lebanon, Pa. Foundry grade stove plate is going to a consumer at West Mahwah, N. J., at \$12 per ton, delivered. No. 1 heavy melting steel is unchanged, but despite slight weakness in the Pittsburgh district, which might affect the eastern Pennsylvania market, it is pointed out that on a special list of the Pennsylvania Railroad, on which bids were opened last week, the heavy melting steel brought \$19.05 and \$18.50 per ton, Youngstown, on about 2000 tons. The monthly list of the Pennsylvania totaling about 40,000 tons is offered this week.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	\$12.00 to \$12.50
Heavy melting steel (yard)	8.75 to 9.50
No. 1 hvy. breakable cast	12.25 to 13.00
Stove plate (steel works)	8.75 to 9.00
Locomotive grate bars	9.25 to 10.25
Machine shop turnings	8.00 to 8.50
Short shoveling turnings	8.00 to 8.50
Cast borings (blast furn. or steel works)	7.00 to 7.50
Mixed borings and turnings	7.00 to 7.50
Steel car axles	18.00 to 18.50
Iron car axles	25.25 to 26.25
Iron and steel pipe (1 in. dia., not under 2 ft. long)	11.25
Forge fire	8.50 to 9.00
No. 1 railroad wrought	12.25 to 12.75
No. 1 yard wrot. long	11.25 to 11.75
Rails for rolling	12.50 to 13.50
Cast iron car wheels	13.00 to 13.50
Stove plate (foundry)	10.00
Malleable cast (railroad)	10.00 to 10.50
Cast borings (chemical)	11.25

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast	\$17.00 to \$17.50
No. 1 hvy. cast (columns, bldg. materials, etc.)	
cupola size	15.00 to 15.50
No. 2 cast (radiators, cast boilers, etc.)	14.50 to 15.00

month, evidently will not get in production on its new models as soon as planned and this has resulted in withholding orders for steel. Large orders for Chevrolet parts have been placed with stamping and other parts makers, but releases against these orders are slow in coming out.

Inquiry in the structural field is light. An export inquiry from Japan for 2500 tons of structural material for cargo handling equipment to be erected at Dairen, Manchuria, is being figured on by a Cleveland fabricator.

Prices are firm at 1.95c., Pittsburgh, for steel bars, plates and structural material. The Cleveland base price for steel bars ranges from 1.90c. to 2.05c.

Pig Iron.—A fairly active buying movement is under way for the first quarter in some sections served by Cleveland interests, although foundries in the Cleveland district are not yet showing much interest in iron for that delivery. Producers with headquarters in Cleveland sold 42,000 tons in foundry and malleable iron the past week, compared with 38,000 tons the previous week. About 75 per cent of this business was for the first quarter. A few inquiries have come out for the first half, but furnaces are declining to quote beyond the quarter. Another inquiry for basic iron has come in the market, this being for 5000 tons from a north central Ohio consumer. Two basic inquiries totaling 20,000 tons or more, previously reported, are apparently still pending. Prices on foundry and malleable iron are firm at the recent advance to \$18, Cleveland, for outside shipment, with one Lake furnace holding to \$18.50 for western and central Ohio and Indiana delivery. In Michigan, \$19 is the ruling price. Business taken during the week was at the advanced prices. In the Valley district, the foundry iron market appears to be holding more firmly to \$17.50. The only price change reported during the week is a 50c. advance in Buffalo, where foundry and malleable iron are now quoted at \$18.50 and \$19 respectively. October shipments will show some gain over September, which was a heavy month in shipments. Furnace stocks have been reduced considerably this month.

Prices per gross ton at Cleveland:

N'th'n fdy., sil.	1.75 to 2.25	\$19.00
S'th'n fdy., sil.	1.75 to 2.25	22.25
Malleable		19.00
Ohio silvery, 8 per cent		28.00
Basic Valley furnace	\$17.00 to	17.50
Stand. low phos., V'ley fur.	26.50 to	27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Iron Ore.—Ore shipments are going along at a heavy rate and the movement by water in October will amount to 8,200,000 tons, or more than 1,500,000 tons gain over the corresponding period last year. With the recent increase in shipping orders, the season's movement is expected to run considerably above that of last year, when total shipments by rail and lake were 52,343,336 tons. There has been some additional chartering of vessels to handle ore.

Cleveland

Pressure for Steel Deliveries Becomes More Insistent— Pig Iron Sales Made for First Quarter

CLEVELAND, Oct. 30.—Pressure for deliveries became the predominating feature of the local steel market during the week, this being particularly true of bar products. There has been an increase in inquiries for lots from a carload to 100 tons from consumers who evidently have about used up their stocks of certain sizes and want quick shipments against new specifications. Price has ceased to be an outstanding factor. With the recent falling off in specifications, the volume of business in this territory during October will be somewhat below that of September, and, while reports do not indicate that deliveries have improved, mills are making heavy inroads into their orders, and some will be able to make better shipments shortly.

Demand for steel from the automotive industry has decreased somewhat because of the seasonal decline in that industry, although it is still operating

at greater capacity than is usual at this time of the year. The Chevrolet Motor Car Co., which was expected to order a large tonnage of steel this

Semi-Finished Steel.—Specifications for sheet bars and slabs continue heavy. Some of the consumers are anxious to accumulate stocks, but are unable to do so, as deliveries are rather slow. There is very little new inquiry, as practically all buyers are covered for the remainder of the year.

Sheets.—A fair amount of new business is coming out in this territory, but there has been a slowing down in specifications from the automotive industry, and in some cases shipments to that industry are being deferred. The Chevrolet Motor Car Co. has purchased a heavy tonnage of auto body sheets for its new models, which were expected to come out Nov. 1, but it is stated that a Cleveland plant that will manufacture the bodies will not start taking shipments in good volume until late in November. Most mills are three to six weeks behind on deliveries. The bulk of the new business is being taken at regular prices, although some price shading is still in evidence.

Strip Steel.—Mills continue to get specifications against contracts for hot-rolled strip. One or two mills during the week adopted the new card of extras and a 2c., Pittsburgh, price for 6-in. and narrower material and 1.90c. for wider material. There is not much new business. Cold-rolled strip is moving well. Some of the mills are still quoting this product at 2.75c., Cleveland and Pittsburgh, for good lots, while others are asking 2.85c.

Wire Products.—Wire is moving well to the manufacturing trade, but nails are quiet. Shading to \$2.45 per keg on nails is still reported in some sections, although leading producers are not making concessions.

Warehouse Business.—October sales show a fair gain over those of September, as deferred mill deliveries are proving a help to warehouse business. The demand for sheets has declined. Prices are firm.

Reinforcing Bars.—Work involving a fair tonnage is still pending, but new inquiry is light. Warehouses are holding closely to 2.25c. Pittsburgh, for cut lengths, but are able to get only small lots at that price. Rail steel bars are quoted at 1.85c., mill.

Coke.—There is only a moderate amount of activity in foundry coke, as most consumers are under contract. Prices are unchanged at \$3.75 to \$4.85 for standard Connellsville brands and \$7.75, Painesville, for Ohio by-product coke, the latter price being for No-

vember shipment. Domestic coke continues active.

Old Material.—The local market continues very firm and prices are higher on heavy melting steel and machine shop turnings. However, Pittsburgh dealers are not offering local dealers as high prices as they were paying a week ago. Prices in Cleveland have not advanced as much as in the Pittsburgh and Valley districts, and local dealers have found it necessary to mark their prices up further to obtain scrap for shipment to Cleveland mills. Dealers now are paying up to \$14.75 for ordinary No. 1 heavy melting steel and \$14 for No. 2 and as high as \$10 for machine shop turnings. Youngstown district mills are understood to have made some scrap purchases. Dealers claim that \$17.50 is the best they can get from mills for No. 1 heavy melting steel for that district. November lists issued by the Michigan automobile companies in-

clude 4400 tons from Dodge Brothers and 4500 tons from the Buick plant.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel.	\$14.50 to \$15.00
No. 2 heavy melting steel.	13.50 to 14.00
Compressed sheet steel.	13.50 to 14.00
Light bundled sheet	
stamp'gs	11.50 to 11.75
Drop forge flashings.	12.25 to 12.75
Machine shop turnings.	9.50 to 10.00
No. 1 railroad wrought.	12.75 to 13.00
No. 2 railroad wrought.	14.50 to 15.00
No. 1 busheling.	13.00 to 13.25
Pipes and flues.	9.00 to 9.50
Steel axle turnings.	12.50 to 13.00
Acid Open-Hearth Grades	
Low phos. forging crops.	16.00 to 16.50
Low phos. billet, bloom and slab crops.	17.00 to 17.50
Low phos. sheet bar crops.	16.50 to 17.00
Low phos. plate scrap.	15.50 to 16.00
Blast Furnace Grades	
Cast iron borings.	10.50 to 10.75
Mixed bor'gs and short turn'gs	10.50 to 10.75
No. 2 busheling.	10.50 to 10.75
Cupola Grades	
No. 1 cast.	16.50 to 17.00
Railroad grate bars.	11.00 to 12.00
Stove plate.	12.00 to 12.50
Rails under 3 ft.	16.75 to 17.25
Miscellaneous	
Railroad malleable.	16.00 to 16.50
Rails for rolling.	16.25 to 16.50

Reinforcing Steel

Two New Projects Call for 2000 Tons Each

WITH an office building at Boston calling for 2000 tons and highway work in Tennessee requiring a similar tonnage, new projects reported to THE IRON AGE in the last week totaled 6225 tons. The following awards of 4650 tons include 1000 tons for an apartment building at Chicago:

WHITE PLAINS, N. Y., 155 tons, garage, to McClintic-Marshall Co.

NEW YORK, 110 tons, warehouse on East Thirty-sixth Street for New York Steam Corporation, to Jones & Laughlin Steel Corporation.

NEW YORK, 100 tons, ash dump at foot of East Seventy-third Street, to Tidewater Structural Materials Corporation.

ASBURY PARK, N. J., 300 tons, convention hall, to Jones & Laughlin Steel Corporation.

WASHINGTON, 500 tons, bridge, to Concrete Steel Co.

FORT BRAGG, N. C., 325 tons, barracks buildings, to Connors Steel Co.

OXFORD, MISS., 115 tons, dormitory, to Connors Steel Co.

MEMPHIS, TENN., 100 tons, National Bank of Commerce building, to Laclede Steel Co.

EVANSTON, ILL., 250 tons of rail steel bars, Young Men's Christian Association Building, to Inland Steel Co.

CHICAGO, 1000 tons of rail steel bars, apartment building at 1420 Lake Shore Drive, to Calumet Steel Co.

CHICAGO, 400 tons of rail steel bars, apartment building at Seventy-second Street and South Shore Drive, to Joseph T. Ryerson & Sons.

CHICAGO, 400 tons, apartment building, awarded by A. & E. Anderson to Kalman Steel Co.

STATE OF ILLINOIS, 100 tons of rail steel bars, road work, to American System of Reinforcing.

EAST CHICAGO, ILL., 800 tons of rail steel bars, buildings for United States Gypsum Co., to Calumet Steel Co.

SACRAMENTO, CAL., 395 tons, highway work in Sonoma County, to Pacific Coast Steel Co.

SAN FRANCISCO, 675 tons, Sears-Roebuck warehouse, to Soule Steel Co.

LOS ANGELES, 164 tons, Rubio Wash Storm Drain, to Blue Diamond Co.

HOQUIAM, WASH., 100 tons, City Hall, to Northwestern Steel Rolling Mills.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

BOSTON, 2000 tons, United Shoe Machinery Corporation office building.

NEW YORK, 250 tons, East 238th Street bridge, Corbetta Concrete Corporation, low bidder on general contract.

NEW YORK, tonnage being estimated, building for Interborough News Co.; Russell G. Corey, architect.

CLEVELAND, 150 tons, addition to Hanna garage.

CINCINNATI, 300 tons, Heberle School, general contract awarded to Penker Construction Co.

NASHVILLE, TENN., 2000 tons, highway projects for State Highway Commission.

CHICAGO, 250 tons, apartment building on Commonwealth Avenue; H. B. Ryan, architect.

CHICAGO, tonnage being estimated, plant addition for Stewart-Warner Speedometer Corporation.

MILWAUKEE, 900 tons, addition to Catholic institution.

WALLA WALLA, WASH., 100 tons, Veterans' Hospital; bids opened.

SACRAMENTO, 127 tons, highway work in San Luis Obispo County; bids Nov. 14.

LOS ANGELES, 145 tons, laundry, South San Pedro Street; bids being taken.

The Superior Steel Corporation, Carnegie, Pa., will start operation in the next few weeks of a new electrically-driven 8-in., 4-stand horizontal hot strip mill, on which it will roll strips as narrow as $\frac{3}{8}$ in. wide up to 3 in. to No. 22 gage. Hitherto, the narrowest strips this company has been able to roll have been 1 in. and then in the heavier gages.

William Jessop & Sons, Ltd., Sheffield, England, steel exporter, has appointed the Pigott Steel Co., 620 Frankfort Avenue, Cleveland, as agent in the Cleveland district.

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.

Pacific Coast

Cast Iron Pipe Market More Active—2000 Tons for Los Angeles Store Largest Structural Award

SAN FRANCISCO, Oct. 27. (By Air Mail)—Demand for iron and steel products on the Pacific Coast is holding up fairly well, but most bookings of the week called for relatively small lots. Included among the larger lots were 2000 tons of structural shapes for Bullock's Store, Los Angeles, booked by the Llewellyn Iron Works, and approximately 1600 tons of cast iron pipe, divided between two makers.

Pig Iron.—A slight improvement in the rate of operations among jobbing foundries in northern California is reported. Specialty plants, such as sanitary ware and stove foundries, continue to operate on fairly heavy schedules. Pig iron prices are unchanged. Imports of foundry iron in July totaled 1248 tons, compared with 1441 tons in June and 1050 tons in July, 1927.

Prices per gross ton at San Francisco:

*Utah basic	\$25.00 to \$26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	24.00 to 25.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—One of the largest reinforcing bar awards in the San Francisco district during the past month or two went to Soule Steel Co. and called for 675 tons for a warehouse for Sears, Roebuck & Co. The Pacific Coast Steel Co. took 395 tons for highway work in Sonoma County, California. Pending business totals more than 5000 tons, the largest project calling for 1800 tons for the Life Science Building at Berkeley. Prices on out-of-stock material have shown no signs of strengthening, and 1.80c., base, is general both in the Los Angeles and San Francisco districts. Imports of bars, both merchant and reinforcing, during July totaled 3615 tons, compared with 2487 tons for June and 2199 tons for July, 1927.

Plates.—The Beall Tank & Pipe Co. secured the largest award of the week, calling for 230 tons for an 18-in. welded pipe line for the Beebe Orchard Co., Wenatchee, Wash. The Pacific Coast Engineering Co., Oakland, Cal., booked 100 tons for Plummer ball joints for various interests. Bids were opened this week on 231

tons of 24-in. riveted pipe for Seattle, alternate bids being taken on cast iron pipe. The United States Engineer Office, San Francisco, will open bids next week on 185 tons of 20-in. shore pipe. Importations in July totaled less than 250 tons. So far this year 680 tons has been brought in. Prices range from 2.20c. to 2.25c., c.i.f.

Shapes.—Pending business does not exceed 6000 tons. The McClintic-Marshall Co. Central Works is low bidder on 2300 tons for the Methodist Book Concern Building, San Francisco. During July, 1428 tons of foreign material came in at Pacific ports. This compares with 1455 tons for June and 2192 tons for July, 1927. Plain domestic material is firm at 2.35c., c.i.f., while foreign shapes are about 1.60c., c.i.f., duty paid.

Cast Iron Pipe.—The cast iron pipe market was active during the week. Los Angeles placed 866 tons of 12-in. Class 350 pipe, with the American Cast Iron Pipe Co. and 720 tons of 6-in. Class 350 with the Pacific States Cast Iron Pipe Co. Various street improvement projects in Seattle, involving 300 tons, went to the United States Cast Iron Pipe & Foundry Co., as did 659 tons of 6 to 24-in. for the Young Street improvement job in Honolulu. Phoenix, Ariz., placed 537 tons of 2 to 12-in. Class B pipe with an unnamed company. E. J. Treacy secured 145 tons for the Franklin Street improvement project in San Francisco, calling for 18-in. Class B pipe. Bids were opened this week on 1284 tons of 24-in. Class B pipe for Seattle, alternate bids being received on riveted steel pipe. H. E. Conner, Redwood City, Cal., was low bidder on 144 tons of 4 and 6-in. Class B pipe for street improvement in Tulare, Cal. In July, 4135 tons of cast iron pipe was imported, compared with 1231 tons in June and 2375 tons in July, 1927.

Steel Pipe.—The largest award of the week involved 300 tons of 4-in. pipe for the Santa Maria Gas Co., Santa Maria, Cal., and was booked by Grinnell Co. Distributors report a better movement from stock. Importations of tubular products, exclusive of cast iron pipe, during July totaled 2157 tons, compared with 2169 tons in June and 4158 tons in July, 1927.

Coke.—Sales and inquiries are limited to unimportant lots for prompt shipment. Imports in July totaled 4659 tons, compared with 4901 tons in June and 3054 tons in July last year. English beehive coke is quoted at \$16 a net ton, delivered incoming dock, and English by-product at from \$11.50 to \$13 a net ton.

Birmingham

Southern Basic Iron Shipped to the Orient—Steel Demand Continues at a Good Rate

BIRMINGHAM, Oct. 30.—In pig iron, this is an in-between buying period, so new sales are light. Estimates by makers as to the amount of fourth quarter iron under contract in the district range from 85 to 95 per cent. Prices are firm at \$16.25 for last quarter delivery. No inquiries are being received for first quarter iron. All makers report October shipments larger than those of September. About 4000 tons of basic iron has been exported to the Orient during the last three weeks, shipments being made by barge on the Warrior River. Another shipment for about half this quantity is scheduled for early November. Iron production is steady. Furnace operations have not been changed since the first week of October. Of the 18 in blast, 15 are on foundry, two on basic and one on ferromanganese.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	\$16.25
No. 1 fdy., 2.25 to 2.75 sil.	16.75
Basic	16.25

Finished Steel.—Owing to the closing of the rail mill of the Tennessee company at the end of the first week of October, the percentage of plant operations in the district last month was considerably lower than in September. There has been a good im-

provement in rail inquiries during the past two weeks. In lines other than rails, backlogs are increasing despite high mill operations. Prices are strong. A large amount of structural steel business is in prospect. Mills are operating full time and some are on double shift. The Southern Steel & Rolling Mill will furnish 450 tons of bars for a new warehouse for the Stockham Pipe & Fittings Co. The aggregate tonnage of reinforcing bar business is good, although it is made up mostly of small orders. The Connors Steel Co. has booked an order for 325 tons for a barracks building at Fort Bragg, N. C. The active open-hearths in the district were increased to 14 when the Tennessee company put on three at Ensley on Oct. 23. Seven are active at Fairfield, and the Gulf States Steel Co. continues with four at Alabama City.

Cast Iron Pipe.—There is little demand from either private or municipal sources. Backlogs are low as a result of recent light bookings. On the few sales that are being made, makers are holding closely to quotations of \$36 to \$37 on 6 in. and larger sizes. Production remains steady.

Coke.—Practically all foundry coke consumers not under contract are buying as needed, sales averaging two to

Warehouse Prices, f.o.b. San Francisco

three weeks ahead of requirements. Coke under contract is moving out in fairly satisfactory volume. Quotations remain at \$5 for both spot and contract.

Old Material.—Sales have dropped off a little, and some consumers have held up shipments for the present. Dealers are still experiencing a little trouble in finding material to apply on some contracts. Prices are fairly firm.

Boston

Pig Iron Price Trend Upward—Scrap Gains Further Strength—Structural Steel Projects Revived

BOSTON, Oct. 30.—The trend of pig iron prices unquestionably is upward. The most active Buffalo furnace is getting \$17.50 a ton, furnace, for No. 2 plain and \$18 for No. 2 X. For No. 1X \$19 a ton, furnace, is openly quoted, but has been shaded. Other New York State iron is generally \$18 a ton, base furnace, with 50c. a ton differentials. The Mystic Iron Works is meeting the Buffalo and other New York State furnace prices. Virginia iron is \$20 a ton, base furnace, with not more than 50,000 tons available. New England foundries in general are busier than at any time this year and have purchased several thousand tons of iron in the past week. The market has been more active than in previous weeks of October. Sales included one lot of 1800 tons of No. 2X to a Massachusetts melter, about 800 tons of No. 2X and No. 1X to a stove maker in this State, and numerous smaller lots for fourth quarter and first quarter. Two small lots of charcoal iron were sold at \$24 a ton, base furnace. Indian iron is sold into December. The largest open inquiry in the market is from the Gilbert & Barker Mfg. Co., Springfield, Mass., for 1000 tons of foundry iron, deliveries to run into 1929.

Foundry iron prices per gross ton deliv'd to most New England points:

*Buffalo, sil. 1.75 to 2.25..	\$22.41
*Buffalo, sil. 2.25 to 2.75..	22.91
†Buffalo, sil. 1.75 to 2.25..	21.28
†Buffalo, sil. 2.25 to 2.75..	21.78
East. Penn., sil. 1.75 to 2.25	23.65
East. Penn., sil. 2.25 to 2.75	24.15
Va., sil. 1.75 to 2.25.....	26.91
Va., sil. 2.25 to 2.75.....	27.41
Ala., sil. 1.75 to 2.25.....	\$23.16 to 25.02
Ala., sil. 2.25 to 2.75.....	23.66 to 25.52

Freight rates: \$4.91 all rail and \$3.78 rail and water from Buffalo; \$3.65 from eastern Pennsylvania; \$5.21 all rail from Virginia, \$6.91 to \$8.77 from Alabama.

*All rail rate. †Rail and water rate.

Coke.—October deliveries of by-product foundry coke will run ahead of those in September, largely because of increased production by the New England Coal & Coke Co. Ovens are still behind on deliveries, however. Foundries are specifying against contracts for stocking purposes as well as for current needs. The price is still \$11 a ton, delivered within a \$3.10 freight rate zone. The November price has not been announced. The outstanding feature of the coke market is the large demand for do-

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel.....	\$12.50
Scrap steel rails.....	\$12.00 to 12.50

mestic fuel. New England fuel is meeting stiff competition from coke made outside these States, which is bringing less than \$8.30 a ton, delivered to dealers.

Shapes and plates.—The market for standard shapes is now firmly established at 1.90c. per lb., Pittsburgh, and indications point to 2c. after Oct. 31, when lower-priced protection given large consumers will be withdrawn. The plate market also is firm at 1.90c., Pittsburgh.

Fabricated Steel.—Several fabricating jobs that have been dormant for months have come to life, and the market is more active. Figures will soon be asked on several thousand tons for a local office building, on 2000 tons for a Brookline, Mass., apartment hotel, on a larger tonnage for the Boston & Maine Railroad hotel, while numerous other jobs ranging from 100 to 500 tons bring the aggregate of probable business to at least 15,000 tons.

Warehouse Business.—Local warehouses are moving more iron and steel products than in months. Current orders are numerous and involve larger

quantities than in any month this year.

Old Material.—Scrap prices are holding strongly, while supplies are growing smaller. Brokers with old contracts cannot fill them except at a financial loss. Material moving out of New England is going to eastern as well as to western Pennsylvania. New England consumers apparently have covered their requirements for the remainder of 1928. Pennsylvania consumers will not pay more for rails for rerolling than for No. 1 heavy melting steel. While \$6.25 to \$6.50 a ton on cars shipping point is the general price range on steel mill borings and mixed borings and turnings, at least one broker is paying \$6.60. Unable to secure steamer space for Danzig shipments owing to heavy grain exports to England and the Continent, exporters have temporarily stopped buying. The export market for automobile scrap is therefore nominal at \$10 to \$10.25 a ton, on dock here. The Navy Yard, Boston, and the Boston & Albany Railroad on Nov. 1 will close bids on a small amount of scrap.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel.....	\$11.50 to \$12.00

Railroad malleable	15.00 to 15.50

Youngstown

Steel Shipments Exceed New Business

YOUNGSTOWN, Oct. 30.—Most of the 10-in. pipe for the Roxana Petroleum Co. oil line from McCamey to Houston, Tex., will be furnished by the Youngstown Sheet & Tube Co. The complete line will take about 45,000 tons. All of the pipe mills of this company, except one butt-weld unit, which ordinarily is held for emergency demands, are in operation. The Republic Iron & Steel Co. is keeping five of its seven units in production. Line pipe still is the backbone of the demand, but there is a constant call for seamless pipe for deep well drilling. Excepting on line pipe, in which there is usually active competition and resultant variation in quotations, prices are holding well, and in the secondary market the price situation is better stabilized than in several years.

Mills in this district are well sup-

plied with sheet orders, although in most cases shipments on old business are outstripping new bookings. The steel output of nine open-hearth furnaces of one local sheet maker is required for the sheets going to the Ford Motor Co. That company is steadily increasing its production and late reports indicate a daily output of more than 5500 units. Demands from several other car builders are lighter than recently. Sheet prices are holding well, although it is admitted that occasional concessions in the common finishes are encountered. These deviations, however, are not viewed with concern, as in the strongest of markets there is always some business that goes at less than the regular prices.

In general, order books appear to be

decreasing. Steel works operations are in the main holding a little below the extreme peak of a fortnight ago. Promises of deliveries on new inquiries are less extended, which would rather point to some recession in plant activities as backlogs work down.

In the scrap market, sales of heavy melting steel at \$18.50 to a local melter, who also bought compressed sheets at \$18 or possibly a little more and turnings at \$13, stand out. These purchases, however, are looked upon as the end of the rise in scrap, which had its basis in the urgency of steel demands, which forced a high rate of steel production and consequently increased the use of scrap, since it was considered doubtful that the demand would hold sufficiently long to warrant the starting of idle blast furnaces.

operating practically at full capacity and are taking liberal tonnages of bars. Prices are firm at 1.95c. to 2c., base Pittsburgh. In common wire nails there has been no deviation from the regular schedule of \$2.69 per keg, delivered Cincinnati. District sheet mills have slightly bettered their position in the past week from the standpoint of backlogs. A healthy demand is reported from consumers and little change in this favorable situation is anticipated in the next 30 days. By that time producers are confident that automobile companies will be coming into the market rather heavily for their requirements. Galvanized sheets are steady at 3.50c., base Pittsburgh, blue annealed at 2c., black at 2.75c. and automobile body stock at 4c. Cold-rolled strip steel is firm at 2.75c. to 2.85c., base Pittsburgh. Makers of rail steel reinforcing bars are quoting 1.85c. to 1.90c., base mill.

Old Material.—While the market is holding its recent gains and there have been further advances in a few items, there are signs of increasing caution on the part of dealers. Some scrap has been purchased in the past few days at less than was paid a week ago. District mills are content to go along with present yard stocks without anticipating future needs. The Big Four has a list totaling 1600 tons closing this week.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel....	\$13.50 to \$14.00
Scrap rails for melting....	14.00 to 14.50
Loose sheet clippings....	9.50 to 10.00
Bundled sheets	10.25 to 10.75
Cast iron borings.....	9.75 to 10.25
Machine shop turnings....	9.25 to 9.75

Cincinnati

Southern Ohio Foundry Iron Advanced 50c. a Ton—Steel Demand Continues Fairly Strong

CINCINNATI, Oct. 30.—While pig iron sales have been confined to small miscellaneous lots for prompt delivery, prices remain strong. Northern Ohio foundry iron is quoted at \$18, base furnace, and southern Ohio foundry at \$18, base Ironton, an advance of 50c. a ton. A Tennessee producer is offering iron for first quarter shipment at \$16.25, base Birmingham, but Alabama furnace interests are not willing to sell beyond this year at that price. In fact, the possibility of an increase of 50c. or 75c. a ton on Southern iron is being discussed in the local trade. The only sizable pending inquiry calls for 600 tons of foundry for a Michigan melter. Jackson County silvery iron is firm at \$25, base furnace, for 8 per cent.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25.....	\$19.89
Ala. fdy., sil. 1.75 to 2.25.....	19.94
Ala. fdy., sil. 2.25 to 2.75.....	20.44
Tenn. fdy., sil. 1.75 to 2.25.....	19.94
S'th'n Ohio silvery 8 per cent.....	26.89

Freight rates, \$1.89 from Ironton and Jackson, Ohio; \$3.69 from Birmingham.

Coke.—Despite a slight slackening of demand for by-product foundry coke in the last two weeks, shipments

in October have been ahead of those of September; in domestic grades the betterment has been even more pronounced on account of cooler weather. By-product coke makers have announced that the current schedule of \$7, ovens, will stay in effect during November, but an increase of from 25c. to 50c. a ton on egg and walnut sizes is certain, although the exact amount has not been determined. For delivery during the remainder of this year and during the first six months of 1929, Wise County beehive foundry coke is being sold at \$5 to \$5.25, ovens, and New River foundry at \$6.50 to \$7, ovens.

Finished Material.—Specifications and orders for bars, structural shapes and plates have trended upward on account of a well diversified demand from all consuming lines. Agricultural implement manufacturers are

St. Louis

Pig Iron Sales Exceed 16,000 Tons—Scrap Again Advances on Heavy Buying

ST. LOUIS, Oct. 30.—Another week of heavy buying marked the pig iron market here, sales of the St. Louis Gas & Coke Corporation totaling 16,350 tons, of which 2750 tons was malleable, 2000 tons basic, and the remainder foundry iron. Most of the purchases were for shipment in the first quarter, although buying for prompt delivery and November-December was unusually heavy. Several weeks ago it was believed that buying for the last quarter had been completed, but the situation changed largely through the activities of stove foundries. Stove plants here and in Belleville and Quincy are enjoying a

tremendous volume of business, which has been stimulated by the production of novelty enameled heaters, lines that are much sought in rural communities. Mail order houses have been heavy buyers of these stoves. More than 7000 tons of the local maker's sales of foundry iron went to stove manufacturers, in lots from 100 to 1000 tons, the latter order to a local manufacturer for shipment this year. Shipments continue heavy and the local maker, operating only one of its two furnaces, has been able to reduce materially its surplus stock of iron. The Granite City maker is selling in Chicago territory at recent advances of makers there, but has

Northern basic, deliv'd.....	21.16

Freight rates: 81c. Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Finished Iron and Steel.—Buying of plates, shapes and bars has subsided, and new business in sheets also is lighter. Warehouse business is about on a par with this time last year, although slightly better than last month. Fabricators of structural steel report little business.

Old Material.—Prices for old material continue to advance, following heavy buying by four large consumers during the past week to 10 days. Strength in Chicago and other centers has also added to the firmness of the market here. Stocks in the hands of some consumers are sufficient for the next four to six weeks, while others' stocks are low. Most consumers are more eager to buy than dealers are to sell at present levels. Advances of 25c. a ton were recorded in heavy shoveling and melting steel, No. 2 railroad wrought, steel car axles, railroad springs, steel angle bars, railroad malleable, and stove plate, while miscellaneous standard-section rails are 50c. higher and steel rails less than 3 ft. are up \$1.50. No. 1 machinery cast is \$1 lower. Railroad lists include: Pennsylvania, 7165 tons; Chicago, Burlington & Quincy, 4695 tons; Union Pacific, 2723 tons; Terminal Railway of St. Louis, 2250 tons; Big Four, 1650 tons; Missouri Pacific, 111 carloads; Chicago, Milwaukee, St. Paul & Pacific, 102 carloads; Nickel

Buffalo

Pig Iron Advanced—Scrap Strong

BUFFALO, Oct. 30.—Buffalo pig iron has been advanced 50c. a ton, bringing the Buffalo base for No. 2 plain foundry to \$17.50 for outside delivery and to \$18.50 for district delivery. The malleable price is up to \$18 for outside delivery and to \$19 for this district. Books have been opened for first quarter on these bases and considerable inquiry has come out. Among the lots sought are 2000 tons of malleable, 2500 to 3500 tons of foundry for a melter in the Utica district, two from the vicinity of New York City for 1000 tons of foundry each, one for 1000 tons from New England and one for 1500 tons of foundry. The General Electric Co. is in the market for part of 1000 tons of foundry and malleable for its Erie, Pa., plant. The Eastern Malleable Iron Co. bought 1000 tons of malleable for Wilmington, Del., and Troy, N. Y. Several 500-ton inquiries for foundry and malleable have come out, mostly from the East. The situation in the immediate district is that almost all the melters are covered for this quarter and have not yet gone into their requirements for the first quarter. Reports here are that Port Henry iron is now being sold on an \$18.50 to \$19 base. No pig iron was shipped over the barge canal last week.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25..	\$17.50 to \$18.50

Basic	17.50 to 18.00
Lake Superior charcoal...	27.28

Finished Iron and Steel.—Operations are being maintained by Buffalo mills at the high rate of recent weeks. Bars are being quoted at 2.05c. to 2.10c. and plates and shapes at 2c. to 2.10c., Buffalo. On black sheets, 2.75c. is firm, and on galvanized the range is 3.50c. to 3.60c. Specifications are

Canada

Pig Iron and Scrap Markets Continue Active—Viaduct Takes 7000 Tons of Steel

TORONTO, ONT., Oct. 30.—Current pig iron business is almost entirely confined to spot delivery, but such orders are appearing frequently. A few inquiries have appeared for foundry and malleable iron for winter requirements of consumers who are prepared to take immediate delivery. Shipments against contracts are going out on schedule. Production of iron continues at the former high level, with seven furnaces active. Prices are strong.

Prices per gross ton:

	Delivered Toronto

No. 1 fdy., sil. 2.25 to 2.75.....	25.00
No. 2 fdy., sil. 1.75 to 2.25.....	25.00
Malleable	25.00
Basic	24.00
	Imported Iron, Montreal Warehouse
Summerlee	33.50
Carron	33.00

Structural Steel.—Several new projects have been announced requiring tonnages of structural and reinforcing steel. The Dominion Bridge Co., Toronto, has been awarded upward of 7000 tons of steel for the new Toronto viaduct. About 5000 tons will be required for a bridge between Lachine and Coughnawaga for the Department of Public Works, Quebec. For a new automobile building for the Canadian National Exhibition, Toronto, 1200 tons will be needed.

Old Material.—Buying is general throughout Ontario and Quebec. Large consumers in the Toronto and Hamilton districts are furnishing the bulk of current business, but in most cases these consumers are not placing forward contracts. Heavy melting steel and turnings are going to consumers in the Hamilton district in large tonnages and new orders are appearing. Machinery cast is in strong demand

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and struc. shapes.....	3.40c.
Soft steel bars.....	3.30c.
Reinforcing bars.....	2.75c.
Cold-fin. flats, sq. and hex.....	4.45c.

Com. wire nails, base per keg.....	\$3.60
Black wire, base per 100 lb.....	3.75

very good. Reinforcing bar business is confined to small lots, but the price is firm at 2.515c., warehouse. The Buffalo State Hospital addition will require about 350 tons of fabricated structural shapes. Operations at the Bethlehem Lackawanna plant are at 90 to 95 per cent, with all the mills on double turn and the rail mill in operation; the Donner Steel Co. is also running at 95 per cent, the Seneca Iron & Steel Co., 95 per cent; the Wickwire-Spencer Corporation, 95 to 100 per cent, and the Buffalo Bolt Co., 75 per cent. The steel making facilities at Lackawanna plant have been increased by the operation of the Bessemer plant.

Old Material.—The market is strong, but there have been no new sales of size. Many old orders are still out, and dealers are finding it difficult to fill some \$15.50 orders for No. 1 steel. Great activity is apparent in this district on the part of Pittsburgh and Youngstown dealers, who are negotiating for Nos. 1 and 2 steel. A mill which last week bought strictly No. 1 grade heavy melting steel at \$16.75 to \$17 has notified dealers to regulate shipments. Some hydraulic compressed sheets are going

New Officers of Foundrymen's Sand Committee

Following the resignation of B. D. Fuller as chairman of the American Foundrymen's Association committee on molding sand research, Fred Erb of the Erb-Joyce Foundry Co., Detroit, and vice-president of the A. F. A., has been appointed general chairman of the committee. Mr. Fuller retains his interest in the committee's activities and remains on the executive committee.

A new position, that of technical director, has been created in the committee's organization, and Dr. H. Ries, head of the department of geology of Cornell University, has been selected to fill the position.

Dr. Ries has been connected with the work of the committee since its inauguration in 1921, first as chairman of the sub-committee on geological survey of foundry sand resources and later as chairman of the sub-committee on tests. One of the most eminent of economic geologists of the country and an authority on clays, Dr. Ries was a pioneer in investigating foundry sands, for his work in 1904 and 1905 on the surveys of the foundry

to Youngstown from Buffalo at \$15.75 to \$17, Youngstown. A car of knuckles and couplers has been sold for \$18.50, but the ruling price is nearer \$17.50. Some machine shop turnings have been sold at \$8.50 to \$9, and the local blast furnaces will pay \$11.50 for short shoveling steel turnings. Considerable difficulty is being experienced by dealers in filling outstanding orders for stove plate, which they are now buying at more than they sold for.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades	
No. 1 heavy melting steel.....	\$15.75 to \$17.00
No. 2 heavy melting steel.....	14.25

Agricultural.....	16.00 to 16.50

dry sand resources of Michigan and Wisconsin was perhaps the earliest systematic investigation of foundry sands. For his earlier work in connection with the committee in its development of sand testing methods, honorary membership in the American Foundrymen's Association was conferred upon Dr. Ries.

The committee on molding sand research, organized in 1921 as a joint committee of the A. F. A. and of the engineering division of the National Research Council, under the chairmanship of Mr. Fuller, recently issued its second volume of "Standard and Tentatively Adopted Methods of Testing and Grading Foundry Sands." The work of the committee as a whole has been of great value to foundrymen in placing foundry sands under technical control. Its future work will be to simplify test methods, carry on research projects and formulate sand grading classifications.

By-Product Coke Corporation is preparing plans which will result in a substantial increase in pig iron output by its Federal furnace property at Chicago.

Railroad Equipment

Large Orders Placed in Company Shops

FREIGHT cars placed in company shops featured the market this week. Orders included 500 automobile cars by the Norfolk & Western, 300 box cars by the Southern Pacific and 300 refrigerator cars by Swift & Co. The Northern Refrigerator Co. has placed 300 refrigerator cars with a car builder. The Buffalo, Rochester & Pittsburgh, whose prospective inquiry for 1000 box cars was mentioned last week, may also purchase 1000 hopper cars. Details of the week's business follow:

Delaware, Lackawanna & Western has ordered 20 locomotives from American Locomotive Co. and has placed 100 box cars with American Car & Mfg. Co.

Alaska Railroad has ordered one Mikado type locomotive from Baldwin Locomotive Works.

Pacific Fruit Express is inquiring for one 0-4-0 type locomotive.

Norfolk & Western expects to purchase 10 all-steel express cars and five mail and baggage coaches. This road has also placed orders for 500 all-steel automobile box cars at its Roanoke, Va., shops.

Chicago, Rock Island & Pacific is inquiring for 15 passenger coaches.

Swift & Co. are building 300 refrigerator cars in their own shops.

Southern Pacific, Texas Lines, will build 300 box cars in its own shops.

Chesapeake & Ohio has renewed its inquiry for six gas-electric rail motor cars.

Chiriqui Land Co., Panama, is inquiring for 50 15-ton freight cars.

Royal State Railways of Siam have made inquiry through C. P. Sanderson, 100 Broadway, New York, for 300 low side all-steel cars of 12 tons capacity.

Northern Refrigerator Co. has ordered 300 refrigerator cars from Pullman Car & Mfg. Corporation.

Buffalo, Rochester & Pittsburgh is now expected to inquire for 2000 freight cars, instead of 1000, as reported last week. In addition to 1000 box cars, it will probably ask for 1000 hopper cars.

Canadian National's car requirements are now stated to be 3300, of which about 2300 will be placed in Canada and the remainder in the United States.

Illinois Central will buy four electric switching locomotives.

Chicago & North Western is in the market for 400 low side gondola cars. Inquiries for additional cars will be made in a few days.

Detroit Scrap Market Continues Strong

DETROIT, Oct. 30.—Shipments of pig iron, which are approximately the same as for September, promise to be on a higher basis in November, when new automobile models get into production.

The market on old material continues strong.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel.....	\$13.00 to \$13.50
Borings and short turnings.....	9.00 to 9.50
Long turnings.....	8.00 to 8.50
No. 1 machinery cast.....	14.00 to 15.00
Automobile cast.....	19.00 to 20.50
Hydraul. comp. sheets.....	12.25 to 12.75
Stove plate.....	11.00 to 12.00
No. 1 busheling.....	10.00 to 10.50
Sheet clippings.....	8.00 to 8.50
Flashings.....	10.75 to 11.25

Non-Ferrous Metal Markets

Copper Again Advanced and Active, Tin Quiet and Strong, Lead and Zinc Unchanged

Copper.—Prices have advanced $\frac{1}{2}$ c. per lb. in the past week. Electrolytic copper was sold on Oct. 26 at 15.75c., delivered in the Connecticut Valley, and then went to 16c. on Oct. 29. This was followed on Oct. 30 by an advance in the export price by Copper Exporters, Inc., to 16.25c., European ports. Producers say that consumers have become anxious about future supplies and prices, and have caused the advances. They feel that many consumers have overbought. They assert, however, that there is or will be plenty

*Refinery quotation; delivered price $\frac{1}{4}$ c. higher.

of copper to go around and that anxiety is not well founded. Domestic consumers have been buying into January, with estimates that 80 per cent of their requirements for that month are covered. Some producers are now selling for February delivery. Sales to foreign consumers have been very heavy in October, with the total estimated at over 80,000 tons up to Oct. 30. Domestic consumers are practically covered through December, but foreign users must still buy some metal for this year, although they, too, have purchased considerable for January delivery. Lake copper is also active and higher at 16.12 $\frac{1}{2}$ c. to 16.25c., delivered, the latter price for delivery on the Atlantic seaboard.

Tin.—Sales for the week ended Oct.

27 were about 1000 tons, with dealers practically the only buyers. The market has been featureless and quiet, with consumers well covered to Dec. 31 and not buying. On Oct. 29, the London market advanced because of purchases of about 600 tons by a new tin company, recently organized, which has been active in selling stock. The market here on that day was very quiet, with only 100 tons sold. Tuesday, Oct. 30, there was more activity, about 250 tons changing hands at 49c. to 49.25c. for spot delivery, New York. London quotations Tuesday were £226 7s. 6d. for spot standard, £222 15s. for future standard, and £226 15s. for spot Straits. Arrivals thus far this month have been heavy at 6940 tons, with 6120 tons reported afloat.

Non-Ferrous Rolled Products

Mill prices on brass products were advanced $\frac{1}{4}$ c. on Oct. 25 and a similar amount on Oct. 27, while quotations on copper materials have been raised $\frac{3}{4}$ c. in the last week, $\frac{3}{8}$ c. on each of the above dates. Zinc sheets are quoted at 9.75c., base, and lead full sheets at 10c. to 10.25c.

List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over

(Prices Cover Trucking to Consumers' Doors in City Limits)

Sheets—		Base per Lb.
High brass.....	20.50c.	20.50c.
Copper, hot rolled.....	25.00c.	25.00c.
Copper, cold rolled, 14 oz. and heavier.....	27.25c.	27.25c.
Zinc.....	10.00c.	10.00c.
Lead, wide.....	9.75c.	9.75c.

Seamless Tubes—		
Brass.....	26.87 $\frac{1}{2}$ c.	
Copper.....	27.87 $\frac{1}{2}$ c.	
Brass Rods.....	18.25c.	
Brazed Brass Tubes.....	28.50c.	

Lead.—Better than normal buying has prevailed recently, with the main interest in prompt and November delivery. Consumers thus far have shown little desire to purchase December metal. In the West, prices are firm at 6.32½c., St. Louis, with the quotation of the leading interest unchanged at 6.50c., New York, as its contract price.

Zinc.—Producers report a fair amount of business each day, and it is expected that October will show a respectable total in sales. Prices continue steady at 6.25c., East St. Louis, or 6.60c., New York. The ore situation is unchanged. The price is still \$40, Joplin; production and shipments last week practically balanced.

Antimony.—The market is quiet and Chinese metal is unchanged at 10.50c. for spot and 10.25c. for futures, duty paid, New York.

Nickel.—Wholesale lots of ingot

nickel are quoted at 35c. with shot nickel at 36c. and electrolytic nickel at 37c. per lb.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Oct. 30.—Prices for copper and tin have advanced in an active market. The old metal market is stronger and sales are in good volume.

Prices, per lb., in carload lots: Lake copper, 16.75c.; tin, 49.75c.; lead, 6.40c.; zinc, 6.35c.; in less-than-carload lots; antimony, 11.50c. On old metals, we quote copper wire, crucible shapes and copper clips, 11.75c.; copper bottoms, 10.50c.; red brass, 10.50c.; yellow brass, 8c.; lead pipe, 4.75c.; zinc, 3.50c.; pewter, No. 1, 30c.; tin foil, 36.25c.; block tin, 45.25c.; aluminum, 12c., all being dealers' prices for less-than-carload lots.

Co.; open-hearth building, 2800 tons, to McClintic-Marshall Co., and merchant mill building, 3935 tons, to Hansel Elcock Co.

BLOOMINGTON, ILL., 400 tons, office building, to Mississippi Valley Structural Steel Co.

DECATUR, ILL., 900 tons, Staley Building, to Mississippi Valley Structural Steel Co.

WENATCHEE, WASH., 230 tons, plates, 18-in. pipe line, Beebe Orchard Co., to Beale Tank & Pipe Co.

OAKLAND, CAL., 100 tons, plates, Plummer ball joints, to Pacific Coast Engineering Co.

LOS ANGELES, 2000 tons, Bullock's department store, to Llewellyn Iron Works.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

ROCKLAND, ME., 100 tons, Nurses' Home. BOSTON, 1500 tons, Medical Arts building. BOSTON, Brighton district, 500 tons, high school.

PROVIDENCE, R. I., 150 tons, savings bank. NEW YORK, 5000 tons, apartment buildings for A. E. Lefcourt in Fifty-eighth Street near Sixth Avenue and in Fifty-ninth Street near Seventh Avenue.

NEW YORK, 2500 tons, apartment building at Third Avenue, Forty-seventh and Forty-eighth Streets.

NEW YORK, 1000 tons, public school No. 96.

NEW YORK, 900 tons, apartment building at Sixty-seventh Street and Central Park West.

NEW YORK, 900 tons, loft building at Fifth Avenue and Thirty-sixth Street.

NEW YORK, 700 tons, apartment building at Eighty-sixth Street and East End Avenue.

NEW YORK, 600 tons, apartment building at 237 East Twentieth Street.

NEW YORK, tonnage being estimated, apartment building at 602 East Eighty-fourth Street.

NEW YORK, tonnage being estimated, apartment building at Seventy-eighth Street and Amsterdam Avenue.

NEW YORK, tonnage being estimated, St. Vincent's Hospital at West New Brighton, S. I.

BROOKLYN, tonnage being estimated, apartment building at Prospect Park West and Garfield Place.

PHILADELPHIA, 2200 tons, plant for United States Gypsum Co.

PHILADELPHIA, 1000 tons, building for Philadelphia General Hospital; reported last week as 500 tons.

PHILADELPHIA, 900 tons, Institute for Mental Diseases.

NORFOLK & WESTERN RAILWAY, 500 tons, bridges.

NASHVILLE, TENN., 2000 tons, highway projects for State Highway Commission.

MEMPHIS, TENN., 900 tons, bank building. LOUISVILLE & NASHVILLE, 1000 tons, bridges.

STATE OF ALABAMA, 2000 tons, highway bridges.

BUFFALO, 2000 tons, manufacturing building for Curtiss Airplane & Motor Co.; James Stewart & Co., Inc., general contractor.

FLINT, MICH., 600 tons, auditorium.

BUFFALO, 350 tons, addition to State hospital.

CHICAGO, 3300 tons, office building at 2042 Lake Shore Drive.

CHICAGO, 1100 tons, store building on South State Street.

SAN FRANCISCO, 2300 tons, Methodist Book Concern Building; McClintic-Marshall Co., low bidder.

Fabricated Structural Steel

Awards Total 30,400 Tons With 6700 Tons for Steel Mill Extensions—33,500 Tons in New Projects

AWARDS of 30,400 tons included 6700 tons for extensions to the Indiana Harbor, Ind., plant of the Youngstown Sheet & Tube Co. and 6860 tons for a group of jobs at New York. New projects, amounting to 33,500 tons, were featured by a number of jobs of fair size. Awards follow:

EAST HAMPTON, MASS., 275 tons, bridge, to Boston Bridge Works, Inc.

BETHEL, VT., 184 tons, State bridge, to Boston Bridge Works, Inc.

NEW YORK, 6860 tons in the following awards as reported to the Structural Steel Board of Trade, Inc.: addition to St. George Hotel, Brooklyn, and service building for Willard Parker Hospital in East Tenth Street, to McClintic-Marshall Co.; loft building at 42 West Forty-eighth Street and apartment building at Park Avenue and Ninety-sixth Street, to Lehigh Structural Steel Co.

NEW YORK, 2500 tons, loft building at Madison Avenue and Fifty-second Street, to A. E. Norton, Inc.

NEW YORK, 700 tons, apartment building at 2780 Broadway, to Easton Structural Steel Co.

NEW YORK, 200 tons, building for Plaza Trust Co. at 655 Fifth Avenue, to La-Cour Iron Works.

NEW YORK, 100 tons, addition to office building at 58 Varick Street, to Structural Iron Works.

NEW YORK, 500 tons, theater at St. Mark's Place, Staten Island for Isle Theater Corporation, to Harris Structural Steel Co.

BROOKLYN, 1200 tons, St. John's Law School, to Hinkle Steel Construction Co.

BROOKLYN, 220 tons, pan house at Greenpoint plant of Improved Cinder Co., to Belmont Iron Works.

BROOKLYN, 160 tons, bank and office building in Wyckoff Street, to National Bridge Works.

CLINTON, N. Y., 500 tons, bridge for State Highway Department, to American Bridge Co.

MOUNT VERNON, N. Y., 166 tons, Junior beams for Terrace Arms apartment building, to Jones & Laughlin Steel Corporation.

JERSEY CITY, 1200 tons, Journal Square Theater, to Harris Structural Steel Co.; reported previously to unnamed fabricator.

KENVILLE, N. J., 150 tons, building for Hercules Powder Co., to Austin Co., Cleveland.

HARRISBURG, PA., 350 tons, Mystic Shrine Zembo Temple, to Jones & Laughlin Steel Corporation.

PHILADELPHIA, PA., 600 tons, addition to Trayler-Allerton Hotel, to Bethlehem Fabricators, Inc.

STATE OF VIRGINIA, 370 tons, Nottoway River bridge, to Virginia Bridge & Iron Co.

BIRMINGHAM, 450 tons, warehouse for Stockham Pipe & Fittings Co., to Southern Steel Works.

SOUTHERN RAILWAY, 600 tons, bridges, to American Bridge Co.

KALAMAZOO, MICH., 1000 tons, Kalamazoo Trust and Savings Bank Building, to American Bridge Co.

DETROIT, 1500 tons, building for United States Gypsum Co., to American Bridge Co.

CLEVELAND, 475 tons, Nickel Plate Railroad bridge, to Fort Pitt Bridge Works.

MUNCIE, IND., 100 tons, Junior beams, Nurses' Home, Ball Memorial Hospital, to Jones & Laughlin Steel Corporation.

SÃO PAULO, BRAZIL, 261 tons, Junior beams, General Motors Corporation assembly plant, to Jones & Laughlin Steel Corporation through Mahon Structural Steel Co., Detroit.

EVANSTON, ILL., 165 tons, cafeteria wing for Township High School, to Wend-nagel & Co., Chicago.

CHICAGO, 265 tons, canopy for La Salle Street station, to Edgers Schillo Co., local.

CHICAGO, 1125 tons, Trust & Savings Bank Co., to American Bridge Co.

INDIANA HARBOR, IND., 6735 tons, extensions for Youngstown Sheet & Tube

PERSONAL

GEORGE T. LADD, whose election as president of the United Engineering & Foundry Co., Pittsburgh, was announced in *THE IRON AGE* last week, designed and built the largest water tube boilers in the world, at the Fordson plant, Ford Motor Co., and has many and varied business and engineering interests. He was born at Edinburgh, Ohio, in 1871, and was

G. T. LADD

graduated from the Sheffield Scientific School, Yale University, in 1891. He then went to Pittsburgh and entered the employ of the Pittsburgh & Lake Erie Railroad, with which he was connected until 1893, when he entered Cornell University and two years later was graduated with a mechanical engineering degree. For the next three years he was a designer at the Brooks Locomotive Works, Dunkirk, N. Y., leaving that company to become mechanical engineer in charge of engine and boiler sales for the Bass Foundry & Machine Co., Fort Wayne, Ind. After 11 years in that capacity he engaged in private consulting engineering in Pittsburgh and in 1910 organized the George T. Ladd Co., a combustion engineering company. The Ladd Water Tube Boiler Co. was organized in 1925, and shortly afterward it was taken over by the International Combustion Engineering Corporation, which about the same time bought out the Heine Boiler Co. Mr. Ladd went with the International corporation, as president of both the Ladd and Heine companies. He also became works manager of the parent organization and a member of its technical advisory board. Mr. Ladd is chairman of the Pittsburgh Testing Laboratories and an official of the Woodings Forge & Tool Co., Verona, Pa., the Davis Brake Beam Co., Johnstown, Pa., and the Columbian Enameling & Stamping

Co., Terre Haute, Ind. He is a Lieutenant-Commander in the United States Naval Reserve.

MARO JOHNSON, assistant engineer of the Illinois Central Railroad, was elected president of the American Railway Bridge & Building Association at the thirty-eighth annual convention held in Boston last week.

JOHN W. HACKER, formerly superintendent of the coke plant of the Central Alloy Steel Corporation, Massillon, Ohio, has joined Dyer Engineers, Inc., Cleveland. His successor is JOHN M. KOMP.

JOHN P. BANKSON has been appointed Cleveland district manager of sales General Refractories Co., Philadelphia. He has been with the company for six years, most of that time in the Cleveland office.

RALPH M. BARNES has been appointed assistant professor of industrial engineering at the State University of Iowa, Iowa City.

HAROLD C. OSMAN, secretary Nugent Steel Castings Co., Chicago, and heretofore in charge of sales for that company, has been appointed works manager.

C. F. WILLIAMS has resigned as manager of sales for the Basic Products Co., subsidiary of the Allen S. Davison Co., Pittsburgh, to become sales manager of the Ward & Shaw Co., Cleveland, commercial printer. His successor is HUGH D. LARGEY, formerly Pittsburgh district manager of sales for the Colonial Steel Co., Pittsburgh. Mr. Williams, who is a graduate of the University of Illinois, class of 1910, was engaged in news-

C. F. WILLIAMS

H. D. LARGEY

paper and trade paper editorial work prior to joining the Davison company in 1917. Mr. Largey is a graduate of Pennsylvania State College and had a brief experience in the open-hearth department of the Allegheny Steel Co., Brackenridge, Pa., before engaging in sales work with the Colonial company in 1922.

JOHN N. CRITCHLOW, formerly Detroit district sales representative Oliver Iron & Steel Corporation, Pittsburgh, is now its general manager of sales. He has been located in Detroit

J. N. CRITCHLOW

for a number of years, first as district sales manager Pittsburgh Crucible Steel Co., Pittsburgh, and later as a manufacturers' agent handling the products of the Atlas Drop Forge Co. and the Bethlehem Steel Co., besides those of the Oliver corporation. Before engaging in sales work he had been an inspection engineer for the United Alloy Steel Corporation and the Bethlehem Steel Co.

FRANK N. SPELLER, director of the department of metallurgy and research, National Tube Co., was elected chairman of the metallurgical advisory board for the Carnegie Institute of Technology and the United States Bureau of Mines at a meeting of the board in Pittsburgh, Oct. 19. Mr. Speller, whose term is for three years, succeeds T. D. LYNCH, metallurgist Westinghouse Electric & Mfg. Co., East Pittsburgh.

CHARLES PACK has resigned as first vice-president and assistant general manager of the Doehler Die-Casting Co., New York, and has established a consulting office at 2720 Woolworth Building, New York.

LOWELL S. MONROE, formerly advertising manager Electric Controller & Mfg. Co., Cleveland, has joined the engineering staff of the Copperweld Steel Co., Glassport, Pa., and will be in charge of service data.

R. L. AGASSIZ, chairman Calumet & Hecla Consolidated Copper Co., New York, was reelected president of the Copper and Brass Research Association, 25 Broadway, New York, at the annual meeting held Oct. 25.

GEORGE H. ADAMS has been made director of sales for the Bunting Brass & Bronze Co., Toledo, Ohio. He has had a large and varied experi-

G. H. ADAMS

ence with the sales and engineering problems of the bearing industries, and prior to his connection with the Bunting company was automotive engineer of the SKF Industries, Inc., New York. He was also chief engineer of the Bock Bearing Co., Toledo.

DR. J. T. NORTON, JR., chief chemist Ludlum Steel Co., Watervliet, N. Y., will discuss Nitralloy at the meeting of the Cincinnati chapter of the American Society for Steel Treating on Nov. 1.

E. S. CARMAN has resigned as secretary and chief engineer of the Osborn Mfg. Co., Cleveland, to establish himself as a consultant on general industrial engineering under the name of Edwin S. Carman, Inc., with offices in Carnegie Hall, Cleveland. He continues to hold a stock interest in the Osborn company, and in his consulting capacity will give special attention to foundry problems.

WILLIAM D. BLISS, former professor of mechanical engineering at Marquette University, Milwaukee, has been appointed a professor in the mechanical engineering department of the Agricultural and Mechanical College of Texas, College Station, Tex.

R. J. McINTOSH has been appointed manager of the steel piling department, Bethlehem Steel Co., in charge of engineering and sales, with offices at Bethlehem, Pa.

TAYLOR ALLDERDICE, president National Tube Co., Pittsburgh, has been made a director of the Pittsburgh Hotels Corporation.

OBITUARY

WILLARD LAMB VELIE, president of the Velie Motor Corporation and of the Velie Monocoupe Aircraft Corporation, Moline, Ill., died at his home in that city on Oct. 24, following a brief illness. He was born at Moline in 1866, a grandson of John Deere, the founder of the agricultural implement manufacturing company of that name. He attended preparatory school at Andover, Mass., and was graduated from Yale University in 1888. For a time he was associated with Deere & Co., but in 1898, he founded the Velie Carriage Co. and five years later, the Velie Motor Corporation. The aircraft company bearing his name was founded more recently, but the factory had reached a daily capacity of six planes. A son, Willard Lamb Velie, Jr., is active in this branch of the family business.

ALFRED G. PLACE, chief electrical engineer Youngstown Sheet & Tube Co., Youngstown, died in that city on Oct. 25, following an operation. He was formerly vice-president of the American Institute of Electrical Engineers.

ROBERT H. CORBETT, chief erecting engineer Nordberg Mfg. Co., Milwaukee, and associated with this industry for more than forty years, died Oct. 16 after an illness of two months. He was born at Springfield, Ill., in 1858, but had lived in Milwaukee since boyhood.

JOHN E. LONERGAN, head of the John E. Lonergan Co., Philadelphia, founder and machinist, died suddenly at Sacramento, Cal., on Oct. 23, aged 87 years. He was born in Ireland and settled at Philadelphia in 1875, having been actively engaged in business in that city until the time of his death. He had patented several devices now used by the Southern Pacific Railroad. He was also president of the H. Brinton Co. and of the California Vineyards Co.

Considerable Increase in Productive Activity

Productive activity in the United States, estimated by *Electrical World* from monthly electrical energy consumption, is given as 134.5 in September, on a base of 100 as the average in 1923-1925. The latest figure shows a sharp increase from the 120.8 of August and is still further above the 118.4 of a year ago. For the first nine months the average has been 121.6, which represents a gain of more than 5 per cent over the 115.4 recorded for the first nine months of 1927.

JAMES A. SMITH, for the last 15 years superintendent of the Schenectady, N. Y., plant, General Electric Co., died Oct. 25, at his home in Schenectady, the victim of a stroke suffered the night before. He was born at Hartford, Conn., May 25,

J. A. SMITH

1873, and in 1888 was employed by the Pratt & Whitney Co., in Hartford, about a year later entering its apprentice shop. He was sent to Chicago to install the Pratt & Whitney exhibit at the World's Fair and, in 1900, was selected to install and demonstrate the company's exhibit at the Paris exposition. From 1901 to 1903 he was associated with the Niles-Bement-Pond Co., and, in 1905, was made superintendent of the Dutchess Tool Works, Fishkill Landing, N. Y., which position he held until he joined the General Electric Co. in 1910. At first he was assistant to the mechanical superintendent at the Schenectady plant and shortly became superintendent of one of the shops. He was appointed general superintendent in July, 1913. He was a member of the company's manufacturing committee and in this capacity was well known in the machine tool and machinery trade.

In the metal industries group the September advance has been still greater. Both the rolling mills and steel plants and the metal-working plants (ferrous and non-ferrous) showed between 125 and 126 in August. In September, however, the figures are 141.2 for the rolling mill group and 144.2 for the metal-working group. A similar advance is shown for the automobile industry, including parts, which went from 143.2 in August to 161 in September. For the first nine months the average of the metal industries group was 126.5, against 113.1 in the corresponding period of 1927.

Machinery Markets and News of the Works

October Business Fairly Large

Machine Tool Orders in the Month May Equal Those of August and September

MACHINE tool business in October may have equaled that of August or September, and in individual instances the sales of the past month probably exceeded those of September. Some machine tool plants are running at practically full capacity, with occasional night shifts, and a good many of the tool companies have enough orders on their books to carry production at the current rate through the remainder of the year.

Reports from Cincinnati are that fully half of the October business booked by plants in that district came from automobile companies or parts makers. In the Chicago district, tractor manufacturers have contributed a good share of the orders. Railroad buying has not been large, but an

improvement is expected in view of larger repair and car-building programs of the principal carriers. The Chicago, Milwaukee, St. Paul & Pacific has placed the final orders on a list totaling about \$80,000. Orders are expected soon against the large list of the Norfolk & Western.

The Industrial Rayon Co., which will equip a machine shop at Covington, Va., is inquiring for about 40 tools. The Briggs Mfg. Co., which is reequipping its Cleveland plant for the manufacture of bodies for Ford cars, has bought seven machines of various kinds. The White Motor Co., Cleveland, has begun the purchase of shop equipment for the manufacture of a new type motor.

New York

NEW YORK, Oct. 30.—Prospective business in machine tools continues large, and some sizable purchases have been made in the past week. The E. W. Bliss Co., Brooklyn, has closed on a part of its list of about 50 tools, including a gear cutter, grinder and turret lathes, new, and several items of used equipment. The total of the list may be reduced by the transfer of some tools to the airplane engine plant from other departments. The General Electric Co., Schenectady, continues an active buyer of equipment and has pending two 25-in. lathes and a 4-ft. radial drill. The New York Central has closed recently on two turret lathes, a radial drill, a milling machine and an engine lathe. The Norfolk & Western list is still open.

Niles-Bement-Pond Co., reports sales of 10 engines and bench lathes in the past week. Other sales by this company included a No. 1-A jig boring machine, four No. 2 jig boring machines, No. 4-A universal die sinker, automatic grinder for thread milling cutters, 6 x 120-in. thread milling machine, two 6-in. and one 12-in. vertical shapers, duplex hand centering machine, 40 x 16-ft. planer, 36 to 44-in. side-head boring mill, two No. 108 Ransom grinders, Cincinnati high-speed tap-

ping machine, No. 2 universal grinder, and a 24-in. super-heavy duty shaper.

Bids have been asked by Miller Parlor Frame Co., 266 Maujer Street, Brooklyn, for new two-story plant, to cost about \$140,000 with equipment. S. J. Fox, 66 Court Street, is architect.

Sturges Multiple Storage Battery Co., Van Wyck Avenue, Jamaica, L. I., plans rebuilding part of plant destroyed by fire Oct. 22, with considerable loss to building and equipment.

Atlantic Gypsum Products Co., 40 Recor Street, New York, will build a one-story crushing plant with storage and distributing facilities, to cost about \$35,000.

Cleveland Container Co., 10630 Berea Road, Cleveland, has leased space in Hoboken Factory Terminal Building, Hoboken, N. J., for new Eastern factory branch and distributing plant. Company recently acquired plant and business of Tulip Container Corporation, Flushing, L. I., which will be removed to new location.

Rizzuto Motor Co., Peekskill, N. Y., has plans for new one-story service, repair and garage building, to cost about \$100,000 with equipment. Fletcher-Thompson, Inc., 542 Fairfield Avenue, Bridgeport, Conn., is architect and engineer.

Electric Storage Battery Co., West End Avenue and Sixty-fourth Street, New

York, has leased two-story building at 201 West Sixty-fourth Street, and will remove to new location and increase capacity. Headquarters are at Philadelphia.

Charles Pfizer & Co., 11 Bartlett Street, Brooklyn, manufacturers of chemicals, have awarded a general contract to Barney Ahlers Construction Co., 110 West Fortieth Street, New York, for a seven-story factory, to cost \$320,000 with equipment.

Dwight P. Robinson & Co., Inc., 125 East Forty-sixth Street, New York, has filed plans for an eight-story automobile service, repair and garage building at 205-13 East Sixty-fourth Street, to cost approximately \$500,000 with equipment.

Charles Freshman Co., 240 West Fortieth Street, New York, manufacturer of radio equipment, has leased space at Bush Terminal, South Brooklyn, for expansion in storage and distributing division.

H. E. Magnuson, 420 Lexington Avenue, New York, architect, has plans for a new automobile service, repair and garage building at Brooklyn, to cost about \$100,000 with equipment.

Ramapo-Ajax Corporation, Hillburn, N. Y., manufacturer of railroad frogs, switches, etc., is reported planning construction of new plant at Seattle, 100 x 200 ft., to cost over \$200,000, for occupancy by its subsidiary, Racor Pacific Frog & Switch Co.

Controlling interest in Fokker Aircraft Corporation, Hasbrouck Heights, N. J., and Wheeling, W. Va., has been acquired by Pacific Coast interests, headed by James A. Talbot, president Richfield Oil Co., Bartlett Building, Los Angeles, and Harris M. Hanshue, president of Western Airways, Inc., same city. Company will be reorganized with capital of about \$4,000,000. Plans are under way for expansion in two plants noted and for new plant near Los Angeles to manufacture aircraft of commercial, military and other types. Last noted reported to cost more than \$500,000. Anthony G. H. Fokker, heretofore head of company, will remain with new organization as designer and technical expert.

Union Sign Co., 825 East Jersey Avenue, Elizabeth, N. J., is having plans drawn for one-story plant, 50 x 100 ft., on adjoining site, to cost about \$25,000 with equipment. Jacob Wind, Jr., 1450 North Broad Street, Hillside, is architect.

Pollak Mfg. Co., Inc., Kearny, N. J., manufacturer of oil and fuel tanks for aircraft, airplane parts, etc., is concluding purchase of plants and businesses of Universal Screw Machine Products Co. and Progress Sheet Metal Works, 541 Devon Street, same place, and will consolidate with organization. Plans are under way for general expansion. Purchasing company is disposing of 400,000 shares of stock for purchases and extensions. Leo L. Pollak is president.

Armour & Co., Union Stock Yards, Chicago, meat packers, are completing plans for new multi-story plant and abattoir at Jersey City, N. J., to cost about \$1,000,-

The Crane Market

ACTIVITY in other branches of the machinery business has not yet been reflected in the field of overhead and locomotive cranes. A fair volume of inquiry continues to accumulate including several lists calling for four to six overhead cranes. One of these lists is from the Waterfront Service Co., Brooklyn, N. Y., and asks for bids on six 5-ton, 67-ft. span gantry cranes for installation on a dock. Engineers are Moore & Dunford, 110 East Forty-second Street, New York. Inquiries for locomotive cranes are scattered among contractors and industrial users.

000 with machinery. J. D. Andrews is chief engineer for company.

Dalton Tool & Machine Corporation, with executive offices at 8 West Fortieth Street, New York, is now manufacturing at its plant at Bridgeton, N. J., all tools formerly made by Dalton Tool Corporation. Eugene P. Herrman, president, and Edwin H. Jonson, treasurer, are also affiliated with Stewart Steel Products Co., manufacturer of fire alarm apparatus, iron castings and general line of metal products.

Aerial Machine & Tool Corporation, New York, has removed from 79 Grand Street, to larger quarters at 591 Hudson Street.

South Atlantic

BALTIMORE, Oct. 29.—Contract has been let by Crown Cork & Seal Co., 1511 Guilford Avenue, Baltimore, to Consolidated Engineering Co., 20 East Franklin Street, for one, two and four-story addition, 150 x 600 ft., at Highlandtown plant, to cost about \$275,000 with equipment. L. R. White, Hearst Tower Building, is architect. Charles E. McManus is president.

Celanese Corporation of America, Inc., Amcelle, near Cumberland, Md., has awarded contract to Hughes-Foulkrod Co., Schaff Building, Philadelphia, for new boiler plant and machinery building at rayon mill, to cost \$250,000 with equipment. Other additions are planned to cost about \$400,000 with machinery.

Bartgis Brothers Co., Hamburg and Bush Streets, Baltimore, manufacturer of paper board products, has acquired property of Thistle Cotton Mills, Inc., Ilchester, Md., on 90-acre tract, and will remodel for new plant to cost over \$200,000 with machinery. Fred L. Smith, 21 East Fortieth Street, New York, paper mill engineer, will prepare plans and place equipment awards.

Chemical Warfare Service, Edgewood Arsenal, Md., is asking bids until Nov. 6 for 27,000 springs, circular 51; until Nov. 5 for 10,000 aluminum die castings, angle tubes, circular 48, and 10,000 flutter valves, circular 47; until Nov. 7 for 6200 sq. ft. wire cloth, circular 50, and 4700 sheets of perforated tin, circular 51.

Carolina Power & Light Co., Raleigh, N. C., has construction under way on new hydroelectric power plant on Pigeon River, near Waterville, N. C., for initial capacity of 67,000 hp. to be increased later to 100,000 hp. Extensions will be made in transmission lines. Entire project will cost more than \$800,000. Company is disposing of preferred stock, portion of pro-

Among recent purchases are:

Lockwood, Greene & Co., engineers, 1 Pershing Square, New York, 15-ton, 31-ft. 11-in. span, 1-motor, overhead crane for Rome, Ga., from Box Crane & Hoist Corporation.

Phoenix Utility Co., 71 Broadway, New York, 60-ton, electric overhead crane for a power station in the West from the Cleveland Crane & Engineering Co.

National Analine & Chemical Co., 40 Rector Street, New York, 15-ton, gasoline operated crawl-tread crane from the McMyler-Interstate Co.

ceeds to be used for construction and improvements.

McClaren Rubber Co., Charlotte, N. C., will make extensions and improvements in automobile tire plant to increase capacity about 25 per cent. to cost more than \$85,000.

General Purchasing Officer, Panama Canal, Washington, is asking bids until Nov. 15 for cable and wire, filing machine, motors, pumps, switches, scoop shovels, cable clips, turnbuckles, wire lath, wire cloth, pipe and pipe fittings, and other kindred products, Panama Schedule 1915.

Southern Lime Products Co. recently organized as subsidiary by S. J. Groves & Sons Co., Cordele, Ga., general contractor, has work under way on new quarrying and crushed stone plant at lime rock properties near city; later second unit will be built. Project is reported to cost more than \$40,000.

Plant of Atlanta Plow Works, 1200 Marietta Street, Atlanta, Ga., was damaged by fire on Oct. 18. Losses were confined to forge room and machinery departments. Rebuilding will begin at once.

Philadelphia

PHILADELPHIA, Oct. 29.—Contract has been let by Huck-Gerhardt Co., Inc., Lucerne and G Streets, Philadelphia, to Paul Broz, 2515 West Huntingdon Street, for two-story addition to millwork plant, 51 x 200 ft., to cost about \$75,000 with machinery. Clarence E. Wunder, 1520 Locust Street, is architect.

J. L. Langsdorf, Philadelphia, has awarded general contract to Lam Building Co., 1001 Wood Street, for one-story machine shop, to cost about \$25,000 with equipment.

Union Battery Co., Philadelphia, has purchased tract, 335 x 420 ft., heretofore held by Six Wheel Co., as site for new factory, to cost more than \$75,000 with equipment.

United States Gypsum Co., 300 West Adams Street, Chicago, has awarded general contract to Morton C. Tuttle Co., 31 St. James Avenue, Boston, engineer and contractor, for new plant at Philadelphia, to manufacture wallboard, building tile, etc.

Arthur L. Shay and James D. Evans, 2055 Washington Avenue, Philadelphia, receivers for Schuylkill Railway Co., Schuylkill Traction Co. and Lakeside Railway Co., will receive bids until Nov. 7 for all or part of electrical machinery, copper and steel, poles and miscellaneous equipment of companies in Schuylkill County.

Taylor-Wharton Iron & Steel Co., High Bridge, N. J., 25-ton special design locomotive crane from the Industrial-Brown-hoist Corporation.

Miehle Printing Press Co., Chicago, two 3-motor, 10-ton, overhead electric cranes from Milwaukee Electric Crane & Mfg. Corporation.

International Harvester Co., Chicago, three electric cranes for tractor plant from Harnischfeger Corporation.

Chicago, Rock Island & Pacific, Burr Oak, Ill., two 15-ton overhead electric cranes from Harnischfeger Corporation.

Atlantic Refining Co., 260 South Broad Street, Philadelphia, has arranged for increase in capital from \$70,000,000 to \$120,000,000, a portion of fund to be used for general expansion, including oil refinery and pipe line construction in Texas.

Borough Council, Mount Ephraim, N. J., has authorized installation of pumping plant in connection with sewage expansion program to cost about \$100,000, for which bids will soon be asked by Remington & Vosbury, 509 Cooper Street, Camden, N. J.

Whiskette Mfg. Co., Terre Hill, Lancaster County, Pa., recently formed by John M. Wenger, Terre Hill, and associates with capital of \$25,000, is said to be planning early operation of local plant to manufacture steel wool specialties. R. G. Jolly, 3240 North Thirteenth Street, Philadelphia, and Paul B. Malebranche, 136 East Essex Avenue, Lansdowne, Pa., are interested in new company.

Board of Trustees, Lafayette College, Easton, Pa., has asked bids on general contract for three-story mining engineering building, to be known as John Markle Engineering Hall, to cost more than \$200,000 with equipment. C. Z. Klauder, 1429 Walnut Street, Philadelphia, is architect.

John S. Smith, Salisbury, Md., formerly operating Salisbury Shipyard, has taken over idle plant of Seaford Boat Works, Seaford, Del., and will expand. Work will soon begin on one-story unit, 30 x 72 ft.; later new shipways will be built and other construction and repair shops erected. Seaford Chamber of Commerce is interested in project.

Holland Furnace Co., 5154 Catherine Street, Philadelphia, with main plant at Holland, Mich., has leased three-story building at 2721-5 Edgemont Street, for new storage and distributing plant.

E. M. Hanson & Co., 130 North Fourth Street, Philadelphia, have been appointed distributors in Philadelphia territory for chucks, chain hoists and trolleys made by Union Mfg. Co., New Britain, Conn.

Cleveland

CLEVELAND, Oct. 29.—Machine tool business is good and October sales will probably show a gain over September. Orders are plentiful for single machines largely from makers of automotive parts. Quick deliveries are usually desired and some manufacturers are losing orders because they cannot meet these demands. One local manufacturer of

automatic machines cannot promise delivery before February on one size and some other machine tool builders are well filled with orders for the remainder of the year. Manufacturers regard the outlook favorable for a good volume of business until the close of the year.

Briggs Mfg. Co., shut down for some time, and which is re-equipping its Cleveland plant to manufacture bodies for Ford cars, purchased seven machines during the week, including drilling machines, lathes and hack and band saws. Industrial Rayon Corporation, Cleveland, sent out an inquiry for about 40 machines for equipping a machine shop, maintenance department and pattern shop in a new plant it will build at Covington, Va. Machine shop will be used to manufacture special machinery. Inquiry includes three 12 to 36-in. lathes, milling machines, upright and radial drills, pipe machines and hack saws. White Motor Co., Cleveland, which will require additional machinery to manufacture a new type of motor, purchased two multiple-spindle drilling machines the past week.

Some local machine tool plants are operating overtime and report a scarcity of skilled labor.

C. & G. Cooper Co., Mount Vernon, Ohio, has purchased manufacturing department of Hope Engineering Co., Mount Vernon, including plant and engine designs. Cooper company has for some time found it necessary to go outside of Mount Vernon for manufacturing capacity and this acquisition will permit it to further expand its facilities in that city. Hope line of vertical gas engines and compressors will fill out the Cooper line, which has consisted of slow speed horizontal types, chiefly in larger sizes. Hope Engineering Co. hereafter will concentrate more on pipe line and construction end of its business, which has become its major interest.

General Motors Corporation, Detroit, has bought plant and business of Guide Motor Lamp Co., 2130 West 110th Street, Cleveland, at a reported price of \$913,690. Plant has been transferred to Delco-Remy Co., a General Motors subsidiary and will be operated with present personnel. H. J. Monson has been president of Guide Company.

Cold Metal Process Co. has moved its equipment from 2318 Logan Avenue, Youngstown, to enlarged quarters in part of plant formerly occupied by Youngstown Boiler & Tank Co., at Mahoning and Glenwood Avenues. Company manufactures shim steel under special patents and will fabricate this metal. L. A. Beeghly, president of Standard Slag Co., Youngstown, and associates, are principal interests in Cold Metal Process Co. which has been in operation for several years. Much of this time its work was experimental, but it is now engaged in commercial production.

Bids will be received by Board of Education, Sixth and Rockwell Streets, Cleveland, until Nov. 12, for one-story foundry for vocational school on Eagle Avenue, to cost \$40,000 with equipment. G. M. Hopkinson is school architect.

Goodyear Tire & Rubber Co., Akron, Ohio, is arranging financing for an expansion and improvement program to cost about \$10,000,000, including new units at local mills, new tire manufacturing unit in South, and other work.

Cloyes Gear Co., 1614 Collamer Avenue, Cleveland, has awarded general contract to Mitzel Co., Keith Building, for one and two-story units, 32 x 140 ft., to cost over \$50,000 with equipment.

Small & Rowley, Terminal Tower Build-

ing, Cleveland, architects, have plans for one-story automobile service, repair and garage building to cost \$150,000.

Sunlight Electric Mfg. Co., Warren, Ohio, manufacturer of electric motors, etc., has filed plans for two-story plant, 40 x 120 ft., to cost about \$40,000 with equipment.

Royal Brass Mfg. Co., 1420 East Forty-third Street, Cleveland, has awarded general contract to Super-Built Construction Co., 1836 Euclid Avenue, for one-story addition, 35 x 130 ft., to cost about \$37,000.

Chicago

CHICAGO, Oct. 29.—Most Chicago machine tool dealers report October sales close to, if not exceeding, the best month of the year. Fresh inquiry bulks large, but is more widely scattered than heretofore in the absence of large lists from tractor plants. Agricultural implement manufacturers, however, are not dormant. They are making miscellaneous purchases in good volume and new lists are expected before the end of the year. Punch presses are in active demand and many types of used machine tools are eagerly sought. Some sales are being made for delivery after Jan. 1.

Chicago, Milwaukee, St. Paul & Pacific has closed last items on an \$80,000 list and Emerson-Brantingham Co., Rockford, Ill., has also made purchases. International Harvester Co. has ordered some new equipment for its Chicago tractor plant, and a screw machine parts manufacturer has purchased a 14-in. x 6-ft. lathe. Nash Motors Co., Milwaukee, has added an 18-in. lathe to its machine tool equipment.

F. Thomas, 616 East North Street, Decatur, Ill., will build a machine shop addition, 24 x 60 ft.

W. J. Spengler, 2320 Milwaukee Avenue, Chicago, will build a one-story brick machine shop, 50 x 109 ft.

Despatch Oven Co., 116 First Avenue North, Minneapolis, maker of all types of ovens, has plans for new manufacturing building to take care of increased business.

Plans have been filed by Stewart-Warner Speedometer Corporation, 1828 Diversey Parkway, Chicago, for 10-story factory unit, 88 x 103 ft., to cost about \$300,000 with equipment.

General Engineering Works, 340 West Huron Street, Chicago, manufacturer of screw machine products, will soon take bids for one-story addition to cost about \$85,000 with equipment. Weiss & Niestadt, 53 West Jackson Boulevard, are architects.

Albertson Co., Sioux City, Iowa, manufacturer of automobile tools, etc., has awarded general contract to W. A. Klinger, Inc., Wamoch Building, for four-story and basement unit, 42 x 150 ft., to cost more than \$65,000 with equipment.

Allis-Chalmers Mfg. Co., West Allis, Wis., is said to have plans under way for new plant at Springfield, Ill., to manufacture tractors, including parts and assembling divisions, to cost more than \$100,000.

Power equipment, conveying and other machinery will be installed in new plant to be built by W. F. Hall Printing Co., 4600 Diversey Avenue, Chicago, to cost more than \$600,000.

Minneapolis Threshing Machine Co., Hopkins, Minn., has awarded general contract to C. F. Haglin & Sons Co., National Building, Minneapolis, Minn., for one-

story addition, to cost \$100,000 with equipment.

Western Harvester Co., subsidiary of Caterpillar Tractor Co., San Leandro, Cal., will establish plant on 75-acre tract at East Peoria, Ill., opposite Caterpillar factory, to manufacture Holt combine harvester and provide for expansion of Caterpillar production. New plant will cost about \$1,000,000. Details of construction are now under way.

International Harvester Co. has awarded contract to Priester Construction Co., Davenport, Iowa, for two-story factory unit, 88 x 550 ft., at Rock Island, Ill., to manufacture engines and castings for tractors.

Super-Maid Aluminum Ware Co., Chicago, has purchased plant of Roseland Can & Wire Goods Co., 612 Harrison Avenue, Rockford, Ill., and is transferring equipment to that place. Roseland company will probably establish plant elsewhere. Chicago company operates foundry and two factories in Chicago and Rockford plant is first branch established.

Rockford Pattern Works, 2414 Eleventh Street, Rockford, Ill., maker of wood and metal patterns, has changed name to Rockford Standard Pattern Works, 250 Mill Street, Rockford.

La Salle Aircraft Corporation, Ottawa, Ill., has been organized to manufacture airplanes. Company intends to build plant and has leased local 71-acre tract for airport and factory site. When work begins it will be in market for materials and equipment.

New England

BOSTON, Oct. 29.—The local machine tool market is dull. October sales by dealers in this district will probably fall considerably below those of September, but will run slightly ahead of October, 1927. Manufacturers of metal-working equipment, as a whole, did better this month than in September, and exceeded October, last year.

Inquiry for used equipment is much better than that for new, particularly for presses and other tools the supply of which is limited. Dealers in foundry equipment have had the best month so far this year, molding machines being in especially good demand. Local representatives of manufacturers of such equipment have not only booked a good business in New England but have taken some excellent Canadian orders. Certain types of conveying equipment also have sold well the past month. Mead-Morrison Mfg. Co., East Boston, is well booked on handling equipment for coke manufacturers, and is figuring on a large order for new coke ovens to be built outside of New England.

Warren Telechron Co., Ashland, Mass., has awarded contract for a plant addition. Fay, Spofford & Thorndike, 44 School Street, Boston, are engineers.

Claflin Sumner Coal Co., 32 Pleasant Street, Worcester, Mass., has awarded contract for a scale house and service station. Handling equipment will be purchased. Cutting, Carlton & Cutting, 44 Front St., Worcester, are architects.

Fisk Rubber Co., Chicopee Falls, Mass., has started work on a plant addition.

Brown & Sharpe Mfg. Co., Promenade Street, Providence, R. I., will soon begin work on an addition and alterations to its foundry. Jenks & Ballou, 1035 Grosvenor building, Providence, are engineers.

C. Leslie Weir, 41 East Forty-second Street, New York, will close bids Nov. 5 on a one-story, 125 x 150 ft., ice manufacturing plant at Malden, Mass., for Boston Ice Co., 11 Deerfield Street, Boston.

Derryfield Co., Inc., Manchester, N. H., on Nov. 7 will sell its personal property, including equipment, stock in trade and finished material.

Plans are being drawn by Capital Parlor Frame Co., 470 Tolland Street, East Hartford, Conn., for one-story factory to cost about \$50,000 with equipment. G. Zunner Co., 182 High Street, Hartford, is architect.

Bellows Falls Hydro-Electric Corporation, Bellows Falls, Vt., operated by New England Power Association, Worcester, Mass., is disposing of a bond issue of \$9,000,000, fund to be used in connection with hydroelectric power development at Bellows Falls and Walpole. Project is estimated to cost \$13,000,000, and remainder of fund will be secured through sale of stock issue. Frank D. Comerford is president.

Boston Filter Co., Broadway, Chelsea, Boston, has acquired two-story factory at 43-47 Harvard Square, Charlestown, for new plant.

Atlas Mfg. Co., 125 Water Street, New Haven, Conn., manufacturer of hardware products, wire goods, etc., has acquired Ansonia Novelty Co. Ansonia, Conn., manufacturer of metal specialties and will merge with its organization. Ansonia business will be removed to New Haven, where expansion will be carried out.

Swift & Co., 60 North Market Street, Boston, meat packers, have plans for two-story plant at Malden, Mass., with refrigerating department and other mechanical facilities, to cost about \$85,000.

Arthur H. Abbott, Inc., 88 Broad Street, Boston, has been appointed New England district sales agent for Roller-Smith Co., 233 Broadway, New York.

Buffalo

BUFFALO, Oct. 29.—Contract has been let by Precision Die Casting Co., Syracuse, N. Y., to J. D. Taylor, Syracuse, for one-story unit at Cleveland, to cost about \$100,000 with equipment.

New York Power & Light Corporation, Johnstown, N. Y., has secured permission to carry out expansion and improvement program at Truxton, Home, Cortlandville and Fabius and other points, including transmission lines, power substations, etc., to cost \$838,000.

H. I. Sackett Electric Co., 251 Pearl Street, Buffalo, electrical equipment and supplies, has acquired a four-story building with about 21,000 sq. ft. of floor space for new storage and distributing plant.

Continental Can Co., Syracuse, N. Y., has authorized increase in capital from 750,000 to 2,000,000 shares of stock, no par value, a portion of fund to be used for expansion.

Curtiss Aeroplane & Motor Co., Kail Street, Buffalo, has awarded general contract to James Stewart & Co., 17 East Forty-second Street, New York, for initial units of new plant at Tonawanda, N. Y. Company has secured contract for quantity of airplanes for Chile totaling about \$900,000.

Hickok Mfg. Co., Rochester, N. Y., has purchased five-acre tract at St. Paul and Scranton Streets, and will begin work immediately on new plant. Building will be of one-story, with about 100,000 sq. ft. of floor space. For a time company will

use both old plant on State Street and new factory, but later it expects to concentrate manufacturing operations in new plant.

Betson-Jewell, Inc., Rome, N. Y., maker of refractory materials, has been merged with Cyclone Grate Bar Co., Buffalo, and offices of combined company will be located in latter city. Earlier in year machinery of the Betson-Jewell organization was removed from Rome to North Bend, Ind. Frank J. Jewell, president of Rome company, will continue to represent company in home territory in a sales capacity, but has severed his connection as manager.

Niagara Sprayer & Chemical Co., Inc., Middleport, N. Y., has been organized to take over properties and business of Niagara Sprayer Co. and affiliated company, Niagara Chemical Co., Inc. Business will be continued without essential changes in personnel or policy. Company also has plants at San Francisco, Jacksonville, Fla., and Burlington, Ont.

Cincinnati

CINCINNATI, Oct. 29.—Machine tool sales the past week have deviated little from the level maintained in the early part of October, and from the standpoint of fresh orders the month is assured of a place alongside August and September. There are individual instances of decreased bookings in the past 30 days, but in great measure these are offset by an equal number of companies which this month are bettering their September record. It is safe to say that approximately 50 per cent of the business booked in the last two months has originated in the automobile industry.

While a slight slackening in sales is anticipated in the immediate future, as a natural consequence of recent heavy buying, machine tool builders are of the opinion that business will continue good during the remainder of the year. Meanwhile, production shows no signs of falling off and the volume of unfilled orders precludes such a possibility in the next month.

Contract has been let by Delco-Remy Corporation, First and Madison Streets, Dayton, Ohio, to Hillsmith & Co., Dayton, for one-story addition, 75 x 120 ft., to cost about \$50,000 with equipment. Company contemplates new seven-story unit to cost about \$200,000 and will soon have plans drawn.

City Council, Troy, Ohio, George L. Smith, service director, plans addition to municipal electric light and power plant to double present capacity, including installation of turbine unit and auxiliary equipment, to cost about \$85,000.

Board of Education, Hamilton, Ohio, contemplates installation of manual training equipment in new two-story junior high school, to cost about \$500,000. F. J. Mueller, Rentschler Building, is architect.

H. Blockman & Co., 376 North Front Street, Memphis, Tenn., paper goods, plan new four-story storage and distributing plant, to cost more than \$80,000 with handling and other equipment.

Smith-Mills Coal Mines Co., Henderson, Ky., plans rebuilding part of tippie and boiler plant recently destroyed by fire.

Air Corps, Material Division, Wright Field, Dayton, Ohio, will receive bids until Nov. 6 for one universal bench saw, rip, cut-off, and miter, with motor drive, circular 168; 50 field instrument testing frames, circular 157; until Nov. 7 for 2000 connecting rod bearing and cap as-

semblies, circular 170; until Nov. 12 for aircraft supplies including extension assemblies, cowling assemblies, radiators, pulleys, fasteners, bolts, windshield assemblies, etc., circular 147.

W. L. Smith, head of Jefferson Investment Co., Exchange Building, Memphis, Tenn., and associates plan automobile service, repair and garage building, 150 x 156 ft., to cost more than \$100,000 including tools and equipment.

Johnson Flying Service, Dayton Airport, Vandalia, Dayton, Ohio, E. A. Johnson, president, plans construction of new hangar with repair facilities.

Jones Sand Co., 277 East Long Street, Columbus, Ohio, steel molding sand, has changed its name to Industrial Minerals Co.

Detroit

DETROIT, Oct. 29.—Contract has been let by Frost Gear & Forge Co., South Horton Street, Jackson, Mich., to North-Moller Co., local, for one-story addition, 100 x 160 ft., with extension, 50 x 100 ft., to cost about \$110,000 with equipment.

Michigan Steel Tube Products Co., Holbrook and Buffalo Streets, Detroit, manufacturer of electric-welded tubing, has engaged Christian W. Brandt, Kresge Building, architect and engineer, to prepare plans for an addition, to cost about \$300,000 with equipment.

Ajax Bolt & Screw Co., 6623 Gratiot Avenue, Detroit, will rebuild part of plant destroyed by fire Oct. 22, with loss reported over \$300,000 including equipment.

Cadillac Sales & Service Co., 121 Wayne Street, Pontiac, Mich., will ask bids in about 60 days for new four-story service, repair and sales building, to cost about \$130,000 with equipment. Fisher Brothers, 24 West Huron Street, are architects.

Monnier Brothers & Co., Algonac, Mich., manufacturers of boat hoists, etc., plan new unit to cost more than \$40,000 including equipment. It is understood that present works will be removed to new location and capacity increased.

Murray Body Corporation, Russell and Aberle Streets, Detroit, is arranging for increase in capital from 300,000 to 900,000 shares of stock, no par value, a portion of proceeds to be used for expansion.

Erb Joyce Foundry Co., Vassar, Mich., has plans for one-story foundry addition, to cost more than \$40,000 with equipment.

American Ship Building Co., Detroit, has placed its local plant on market, consisting of 15 acres at foot of Orleans Street, on Detroit River, previously known as Detroit Drydock & Engine Works. Company will concentrate operations in future at shipyards at Lorain and Cleveland, Ohio, where increased output will be developed. W. H. Gerhauser is president.

Michigan Steel Corporation, Ecorse, Mich., is disposing of bond issue of \$1,250,000, a portion of fund to be used for expansion. George R. Fink is president.

Briggs Mfg. Co., 11631 Mack Avenue, Detroit, manufacturer of automobile bodies, has asked bids on general contract for two and three-story addition, 550 x 700 ft., to cost more than \$450,000 with equipment. Albert Kahn, Inc., Marquette Building, is architect and engineer.

Federal Screw Works, 3401 Martin Street, Detroit, has acquired plant and business of Chelsea Screw Co., Chelsea, Mich. Purchased property will be known

as. Chelsea Division, with operations in charge of M. J. Dunkel, heretofore president of company, who will continue as vice-president of such division.

Russel Wheel & Foundry Co., Detroit, engaged in fabrication and erection of steel structures and in heavy machine work, has changed name to Russel Steel Construction Co.

Pittsburgh

PITTSBURGH, Oct. 29.—A well sustained demand is commonly reported by machine tool dealers, most of whom find sales to be small individually, but fairly numerous. As yet the Westinghouse Electric & Mfg. Co. has bought only a few of the items in its fourth quarter list.

J. C. and Christ Rieger, Fulton Building, Pittsburgh, architects, have plans for three-story automobile service, repair and garage building at Turtle Creek, Pa., to cost about \$85,000 with equipment.

United States Engineer Office, Pittsburgh, will soon take bids for river improvements in local district to cost more than \$1,000,000, including emergency dam, lock-operating machinery, power plant equipment for Deadmans Island fixed dam. Bids will be asked in about 60 days for lock buildings, including power station and other machinery.

West Virginia Hydro-Electric Co., Charlottesville, Va., is planning construction of hydroelectric power station on New River, near Hinton, W. Va., to cost over \$400,000.

In connection with expansion program at New Kensington, Pa., Aluminum Co. of America, Inc., is also considering additions in fabricating plant, to cost \$500,000 with machinery, not included in main program.

Board of Public Education, Forbes and Bellefield Streets, Pittsburgh, is asking bids until Nov. 8 for machine shop equipment for Liberty junior high school; wood-working machinery for Osceola school; drafting tables for South Hill high school; cast iron boilers, etc.; specifications at office of George W. Gerwig, secretary.

J. I. Thomas, Lewistown, Pa., is establishing a new plant at South Juniata and West Charles Streets, Hollywood district, to manufacture sheet metal products, brass and copper specialties, etc.

St. Louis

ST. LOUIS, Oct. 29.—Contract has been let by Meeker Advertising Co., Third and Michigan Streets, Joplin, Mo., manufacturer of advertising novelties, etc., to Albert Woods, 2802 Joplin Street, for new unit to cost about \$100,000 with equipment.

Board of Public Service, St. Louis, will receive bids until Nov. 20 for 10-ton electric box crane for municipal fire department.

American Eagle Aircraft Corporation, 2330 Harrison Street, Kansas City, Mo., is disposing of a stock issue of \$675,500 for expansion, including new plant at Fairfax airport, Kansas City, Kan. Crescent Propeller Co., a subsidiary, will also increase output for manufacture of propellers for Eagle aircraft, as well as other specialties.

Chamber of Commerce, Norman, Okla., is at head of project to construct and operate municipal airport, including hangars, repair shops and other units, to cost about \$50,000.

Corona Silica, Inc., care of H. R. McKnight, Tulsa, Okla., president, recently

formed by Mr. McKnight and associates with capital of \$750,000, plans development of silica properties near Rogers, Ark., including construction of grinding and refining mill. Project will cost over \$400,000.

E. J. Rodda Motor Co., 200 South Lawrence Street, Wichita, Kan., is having plans drawn for new service, repair and garage building, to cost about \$145,000 with equipment. S. S. Voight, 524 South Lawrence Street, is architect.

Sinclair Pipe Line Co., Sinclair Building, Tulsa, Okla., has plans for one-story and basement machine shop to cost about \$20,000 with equipment; company also plans similar unit at Drumright, Okla., to cost approximately like sum. Work will soon begin on 10 pumping plants for pipe line from Tulsa district to Chicago, to cost about \$200,000 with equipment.

American Foundry & Mfg. Co., Ninth and Wright Streets, St. Louis, will rebuild part of plant unit destroyed by fire Oct. 20.

Board of Education, St. Louis, has authorized call for bids for five-story vocational high school at Grand Boulevard and Windsor Place, to cost about \$3,000,000 with equipment. R. M. Milligan is commissioner of school buildings in charge.

Missouri Carriage Works, Inc., 1915 Broadway, Kansas City, Mo., has awarded general contract to Morley Brothers, Dwight Building, for two-story addition to cost about \$40,000 with equipment. Hans Von Unwerth, Finance Building, is architect and engineer.

Gulf States

BIRMINGHAM, Oct. 29.—Contract has been let by Wackman Welded Ware Co. of Texas, Inc., Sawyer Street, Houston, Tex., to Forrest W. McNeir, 2603 Chartres Street, for one-story plant, 92 x 200 ft., to cost about \$55,000 with equipment. Headquarters are at Seventh and Victor Streets, St. Louis.

Dallas Power & Light Co., Dallas, Tex., has authorized expansion and improvement program to increase capacity about 50 per cent, and to cost about \$2,750,000.

American Battery Products Corporation, Wichita Falls, Tex., C. V. Chermendy, head, is contemplating new plant to cost about \$50,000 with equipment.

Asiatic Petroleum Co., Ltd., 65 Broadway, New York, is completing plans for storage and distributing plant on 60-acre tract at Port Tampa, Fla., including pumping plant and power station, to cost more than \$100,000 with equipment.

City Council, Waco, Tex., plans municipal airport on 200-acre tract, including hangars, repair and reconditioning shops and other units, for which appropriation of \$75,000 has been approved. E. E. McAdams is city manager.

Shell Pipe Line Co., affiliated with Roxana Petroleum Co., Shell Building, St. Louis, plans construction of new pipe line from McCamey, Tex., to new refinery on ship channel near Houston, Tex., to cost more than \$1,000,000. A storage and distributing plant will be built at McCamey, with steel tanks of 80,000-bbl. capacity, pumping stations and auxiliary equipment.

Linde Air Products Co., 30 East Forty-second Street, New York, and 504 Dolores Street, San Antonio, Tex., has awarded contract to Sumner-Sollitt Co., San Antonio, for one-story plant on Cassiano Street, to cost about \$40,000 with equipment.

City Council, Brownsville, Tex., plans extensions and improvements in municipal

electric light and power plant and waterworks, with installation of additional equipment, to cost \$150,000, for which bonds will be issued.

Texas Co., Texas Building, Houston, Tex., has acquired property at San Antonio, Tex., for new oil refinery, and will carry out project in connection with similar plant on site recently purchased at El Paso, Tex. Plants are reported to cost about \$1,500,000, including pipe line construction, and are scheduled for completion next summer. A third refinery at Amarillo, Tex., with rating of 90,000 bbl. a month, is also planned.

National Portland Cement Co., Houston, Tex., care of C. S. Atkinson, 3406 La-Branch Street, secretary and treasurer, recently organized with capital of \$250,000, plans operation of local works to manufacture special white cements. It has acquired plant and business of Gates Chemical Co., Mary and North San Jacinto Streets, and will operate as unit.

Aransas Compress Co., Corpus Christi, Tex., plans construction of third unit to cotton compress plant to cost about \$140,000.

Carlos B. Schoeppl, Consolidated Building, Jacksonville, Fla., architect, is completing plans for automobile service, repair and garage building, to cost about \$145,000 with equipment.

Indiana

INDIANAPOLIS, Oct. 29.—Acme Tool & Machine Co., 924 Fort Wayne Avenue, Indianapolis, has awarded general contract to Leroy Wakefield, 5805 Morris Street, for one-story machine shop, 40 x 115 ft., to cost about \$25,000.

City Council, Columbia City, has awarded general contract to G. A. Walters, Columbia City, for municipal power plant, to cost about \$50,000 with equipment.

Commercial Testing & Engineering Co., 37 West Van Buren Street, Chicago, engineer, has plans for two-story addition to boiler plant at Progress Laundry, 428 East Market Street, Indianapolis, to cost about \$30,000.

V. L. Wright, Anderson, and associates are organizing company to establish plant to manufacture aircraft motors, of radial air-cooled, five-cylinder type, 100 and 159 hp. D. J. DesChamps will be engineer, in charge of production.

Klieber-Dawson Machine Co., 316 North State Street, Indianapolis, has awarded general contract to Austin Co., Cleveland, for one-story machine shop, to cost about \$30,000 with equipment.

New Jersey, Indiana & Illinois Railway Co., 1508 West Division Street, South Bend, has awarded general contract to John Nelson Co., Monroe Building, for new engine terminal, with engine house, repair shop, etc., to cost about \$50,000.

Crown Machine Co., 4301 Newton Avenue, Indianapolis, has filed plans for one-story machine shop, 54 x 140 ft., to cost about \$28,000 with equipment.

Pacific Coast

SAN FRANCISCO, Oct. 24.—General Petroleum Corporation of California, Higgins Building, Los Angeles, is completing plans for first two units of new oil refinery at Hermosa Beach, near Los Angeles, where 1000-acre site is available. Plant will have initial capacity for handling 30,000 bbl. per day, with storage and distributing facilities of 1,200,000 bbl., to cost about \$2,000,000.

Standard Pipe & Supply Co. 4437 Santa Fe Avenue Los Angeles has awarded general contract to John Flick, 6820 Seville Avenue, Huntington Park, for one-story storage and distributing plant, 50 x 240 ft., to cost over \$50,000 with equipment.

San Francisco Aircraft Specialties Corporation, San Francisco, care of J. R. Gilbert, 408 Warren Road, San Mateo, Cal., recently formed by Mr. Gilbert and associates, is planning new works for airplane production, including parts production and assembling, to cost about \$60,000 with equipment.

Pacific Gas & Electric Co., 245 Market Street, San Francisco, has plans for new equipment storage and distributing plant in Mission district, including repair department, to cost about \$100,000 with equipment. Engineering department of company is in charge.

Reed Roller Bit Co., 1317 Esperanza Street, Los Angeles, has awarded contract to Union Iron Works, 5125 Santa Fe Avenue, for addition to machine shop.

State Highway Commission, Sacramento, Cal., is considering new equipment maintenance and repair shops near Eureka, Cal., to cost more than \$75,000 with equipment. G. B. McDougal, Sacramento, is State architect.

Puget Sound Glass Co., Anacortes, Wash., is said to be planning new plant at Seattle, to cost more than \$200,000 with machinery. W. H. Nichols is president.

Pacific Coast Cement Co., 3801 East Marginal Way, Seattle, has awarded general contract to Pacific Coast Engineering Co., Seattle, for one-story addition to cost \$175,000; also contract to MacDonald Engineering Co., Seattle, for addition to storage and distributing plant to cost approximately \$75,000.

Power and refrigerating machinery, conveying and other equipment will be installed in one and two-story and basement plant, 125 x 140 ft., of Rocky Mountain Packing Corporation, Murray, Utah, to cost \$200,000.

Kay Steel Co., Alhambra, Cal., is completing plans for one-story unit, 80 x 240 ft., to cost over \$60,000 with equipment; a crane runway will be installed. Emmett G. Martin, Chester Williams Building, Los Angeles, is architect.

Norman S. Wright, with offices at San Francisco, Los Angeles and Seattle, has been appointed Pacific Coast agent for products of Bayonne Bolt Corporation, 117 Liberty Street, New York.

Canada

TORONTO, Oct. 29.—Machine tool sales hold at a good level with a steady flow of one or two unit orders from diversified sections. Both dealers and builders report good orders from automobile manufacturing districts, garages and repair shops. Second-hand and rebuilt tools are moving freely. Small tools also are in good demand.

Plant of Rideau Power Co., Merrickville, Ont., was damaged by fire to extent of \$80,000. Equipment was almost a total loss. It is planned to rebuild immediately.

Board of Water Commissioners, Oshawa, Ont., has instructed city engineer, W. C. Smith, to obtain prices on installation of a complete auxiliary pump for city pumping station.

Avon River Power Co., Windsor, N. S., having acquired Stewiacke Electric Light & Power Co., Ltd., plans construction of

a plant at Falls River, N. S., to supply power to municipalities in district. With transmission lines it will cost about \$160,000.

Norton Co. of Canada, Ltd., 3 Beach Road, Hamilton, Ont., manufacturer of grinding wheels, etc., has awarded contract to W. H. Cooper, 6 Hughson Street, North, for an addition to cost \$25,000.

Firth Brothers, 144 James Street North, Hamilton, Ont., is erecting a four-story and basement plant, 84 x 149 ft., to cost \$250,000. John Poag & Son, 9 Westinghouse Avenue, has general contract. A number of sub-trades have been let.

City Engineer's Department, Montreal, is preparing plans for a power plant to cost about \$100,000. H. A. Terreault is engineer.

Western Canada

Restmore Mfg. Co., Ltd., 1000 Parker Street, Vancouver, B. C., manufacturer of woven wire springs, furniture, has awarded contract to E. J. Ryan Contracting Co., for four-story addition, 33 x 260 ft., to cost \$25,000. J. E. McKenzie, 5 Fairfield Building, is architect.

Barrett Roofing Co., foot of Oak Street, Point Grey, B. C., has awarded contract to Dominion Construction Co., for one and one-half story addition, 50 x 75 ft.

Regal Oil Refining Co., Ltd., Calgary, Alta., has awarded contract to Foster Construction Co., 918 Eighth Avenue West, for one-story oil refinery, 42 x 60 ft., and pump house, 18 x 24 ft.

Foreign

PLANS are being arranged by Lysaghts, Ltd., Newcastle, Australia, for expansion and improvements in iron and steel mills, including new buildings, to double present capacity.

Administracion General de Las Usinas Electricas del Estado, Canelones, Uruguay, has completed plans for new electric power plant at Montevideo to cost about 3,000,000 pesos (about \$3,060,000), and will take bids soon on general contract.

South African Railways, Johannesburg, are asking bids until Nov. 15 for one overhead runway system for new cargo shed.

L. & N. Brown Coal Co., Ltd., London, England, subsidiary of Sensible Heat Distillation, Ltd., same city, has arranged with Australian Shale Corporation, Hobart, Tasmania, for new coal carbonization plant in Tasmania, with capacity for handling 100 tons of coal per day. Plant will be operated by Australian company under direction of Brown Coal company.

A phosphate manufacturing company at Dunedin, New Zealand, has approved plans for expansion and improvements, including modernization of present works, and has arranged fund of about £120,000 (approximately \$600,000) for project, including new equipment.

Council, Wellington, New Zealand, is asking bids until Dec. 3 for one plate bending machine.

Ruhr Gas Co., Essen, Germany, is planning construction of pipe lines from Ruhr coal fields to distant and neighboring centers, including line to Hanover, about 125 miles, latter to cost more than \$2,000,000 with compressor plants. Company is arranging for sale of bonds totaling \$10,000,000, large part of fund to be used for program.

National Aeronautical Research Laboratory of City of Berlin, Germany, has plans for new airport in vicinity of

Tempelhof, consisting of hangars for commercial and research planes, machine and repair shops, testing laboratories, oil storage and distributing buildings and other units, to cost about \$250,000. Three similar airports are planned in other districts, one at former Zeppelin field at Stanken, to include training schools and aircraft production facilities.

New Trade Publications

Surge Tanks.—Chicago Bridge & Iron Works, 37 West Van Buren Street, Chicago. Booklet of 20 pages illustrating and describing Johnson differential surge tanks for hydraulic power plant regulation. The pamphlet sets forth advantages following the use of such equipment, compares different types and illustrates such tanks located in many parts of the country.

Nickel Steel.—International Nickel Co., New York. Pamphlet No. 12 on nickel steel and its applications is entitled "Alloy Steel for Boiler Construction." It is reprint of a paper by Charles McKnight of that company, delivered at the semi-annual meeting of the American Society for Steel Treating at Montreal, Canada, in February, 1928.

Heat Treatment.—Stanley P. Rockwell Co., Hartford, Conn. Bulletin No. 2808 discusses the importance of time control in heat treatment where distortion is detrimental.

Tramrails.—Cleveland Electric Tramrail Division, Cleveland Crane & Engineering Co., Wickliffe. Catalog No. 4, describing and illustrating completely for the first time the company's standardized overhead conveying equipment. The design of the tramrail rails is described, together with illustrations of installations. Also covered are hand-propelled carriers operating on tramrails, rack carriers to operate on tramrail systems, tramrail systems for molding machines, and sand riddles, chain hoist carriers, furnace chargers, gantry and jib cranes, transfer bridges and various accessories.

Measuring Labor Operations.—Haynes Corporation, First National Bank Building, Chicago. Pamphlet of 56 pages devoted to the Mani system of measuring labor and comparing its efficiency, man by man, operation by operation, or department by department. The system is said to have been in use for six years and to provide economies and added information regarding the progress of the business.

Valves.—Merco Nordstrom Valve Co., Engineers Building, Cleveland. Catalog No. 6 of 142 pages illustrates and describes Nordstrom valves, which are of the plug-cock type, lubricated. A wide variety of patterns is shown, with dimensions for the different sizes under each type. Elevations and plans supplement the halftones, while there are a number of sectional views.

Compressors.—Chicago Pneumatic Tool Co., 6 East Forty-fourth Street, New York. Four bulletins devoted to compressors of various types. No. 700 of 24 pages illustrates and describes duplex air compressors driven by power, giving details of construction as well as installation views. No. 720 of 24 pages illustrates and describes straight-line air and gas compressors driven by steam or other power. No. 786 of eight pages covers vertical duplex compressors, and No. 788 of eight pages covers vertical simplex air compressors.

THE IRON AGE

New York, November 8, 1928

ESTABLISHED 1855

VOL. 122, No. 19

Time Saved on Multiplicity of Parts

Mechanical Handling in Plating Department of Cash
Register Plant More Than Doubles
Turnover of Material

BY BURNHAM FINNEY*

WHEN a product is made up of many small parts, one of the puzzling problems for the manufacturer to work out is the most economical means of handling the units within and between various departments. When the number of parts totals 42,000, as it does in the plant of the National Cash Register Co., Dayton, Ohio, the problem becomes far more difficult than in the average metal-working factory. Furthermore, success in keeping down costs necessarily depends upon the efforts exerted in that direction by each individual department, if the plant

in its entirety is to benefit to the greatest possible degree.

Recently attention has been centered on solving most efficiently the mechanical handling problem in plating departments, and in this direction the National Cash Register Co. has been able to make a substantial saving. The greatest expense in manufacturing is said to be the time material is idle between operations. In cutting down this idle time about 60 per cent, a distinct advance over previous handling methods has been made in the plating department.

In the process of making cash registers more than 32,000 individual parts pass through the plating department. Many of the parts cannot be scheduled for plating at stated inter-

*Resident editor at Cincinnati for THE IRON AGE.

PARTS Received and Shipped by the Department Pass Through a Central Overhead Station in Charge of One Man, Who Dispatches Tote Boxes to Their Proper Destinations

Conveyors leading down to floor below. At C is copper plating machine delivering to buffing. Plating racks are loaded at F. G is one of several small hoists marked with crossed lines. E is a railroad track; belts are stippled

PARTS to Be Cadmium Plated Are Racked by Hand Ready for Passage to Automatic Cleaning and Electroplating Conveyor (F on Plan). Some racks hold 42 parts, others double that number

vals, further complicating the problem of arranging equipment to the best possible advantage. The manner in which the company has met this situation is detailed in this article.

Overhead Conveyors Save Floor Space

To conserve space and to use most profitably the present quarters occupied by the department, roller and belt conveyors have been installed overhead. All material received comes in through a central overhead receiving station, in charge of one man, from which gravity conveyors go out to the various stations. Wherever the carrying out of the system of gravity conveyors would interfere with the headroom needed by workmen, because of the necessary downward slope, a combination of gravity and belt conveyors has been used. The gravity type extend from the central station to the point where the desired minimum height above the floor is reached; there the conveyor deposits material on a belt conveyor which takes it to its destination.

In certain instances conveyors have top and lower runs because all finished parts are sent out of the department as well as received through the central overhead station, which is adjacent to elevators passing all floors in the building. However, in other cases it has been found desirable to have separate incoming and outgoing conveyors paralleling each other. From the conveyors, branch spurs lead to spiral roller conveyors, down which the material passes to the station where it is to be used. When plated parts are ready to be dispatched to the next operation, they are placed on a small vertical elevator which carries the material upward to a roller conveyor just under the ceiling, which passes it to the central station.

All parts are transported in tote boxes. When the dispatcher at the central overhead station receives a box, he looks at the route card accompanying it and shunts the material to the station to which it must go. He follows the same procedure when plated parts arrive at the station, the tote boxes being deposited by him on the elevator to go to the department where the next operation is to be performed.

Cadmium plating of parts is done automatically by means of a cleaning and electroplating conveyor, which is closely linked with a sprocket and chain overhead conveyor on which cash register parts are racked. Standard racks made of brass and steel, covered with rubber, hold 42 parts each, although some racks have double that capacity. Parts are taken from tote boxes and put on a table by workmen. From the table the parts are placed by hand on the racks, which, when filled, are suspended by hooks from the overhead conveyor. This conveyor bounds a rectangular space in which the tote boxes are stored.

Loaded racks move along the conveyor to the point where the cadmium plating process begins. There they are transferred to the plating conveyor by hand. After passing through the plating process, which returns them to the position from which they started, the plated parts are removed from the racks and are placed in tote boxes by the same workman who started them on their journey. The empty racks then are put on the overhead sprocket and chain conveyor, which carries them again to the workmen at the loading station.

Cadmium plating consists of nine operations. Parts first are dipped in a potash soaking and cleaning bath for a period of 7 min. and then pass through an electric cleaner and cold water rinse. Next they are submerged in a hydrochloric pickle dip for 2½ min., after which they go through two cold water rinses. The parts then are submerged in the cadmium plating bath for 6 min. This is followed by a cold water rinse, a hot water rinse and passage for 6 min. through a hot air drying oven. During the entire process the conveyor moves at a speed of 48 in. a minute.

Nickel plating of cash register parts, also, is done with the aid of an automatic cleaning and electroplating conveyor, the consecutive operations being as follows:

1. Soaking and electric cleaning.
2. Cold water rinse.
3. Hydrochloric pickle.
4. Cold water rinse.
5. Cyanide dip (hooded).
6. Cold water rinse.
7. Cold water rinse.
8. Nickel plating (42½ min.).
9. Cold water rinse.
10. Hot water rinse (hooded).
11. Hot air drying oven (6 min.).

With the exception of the fact that there are no electric cleaning and no cyanide dip, the process used in copper plating parts is similar to that of nickel plating.

Each automatic plating machine is equipped with a 3-hp. motor and a 6-volt, 2500-amp. generator, electrically driven for the plating tank, while the electric cleaning solutions collectively are taken care of by a 12-volt, 5000-amp. generator. Power for the operation of the belt conveyors is supplied by one 5-hp. motor, two 3-hp. motors and one 1-hp. motor.

Keys Are the Main "Production" Item

Cash register keys are the only part that comes to the plating department regularly and for which a definite daily schedule is planned. Keys are racked by hand, in the same manner as the parts for cadmium plating, and move by an overhead chain and sprocket conveyor to the copper plating conveyor, to which the racks are transferred. After the keys are copper plated, the racks are transferred back to the overhead sprocket chain conveyor, which carries them a short distance to buffing machines to be copper buffed. Here the movement of the racks is timed to conform with

PLATED Parts to Be Dispatched to Next Operation Are Placed on a Small Elevator (G on Plan Is an Example) Which Carries Material Upward to Conveyor, Along Which It Moves to Central Station

the needs of the machine operators. Each workman who removes a rack from the conveyor buffs all of the keys on the rack before returning it to the conveyor.

From this point the racks of keys go on the conveyor to the nickel plating machine, where the handling process is the same as that in connection with copper plating. After being nickel plated, the keys, still on the racks, go again to the buffing operators, who nickel buff them and deposit them in tote boxes. When the tote boxes are filled, they are lifted by hand on to the vertical elevator nearby, which carries them to the overhead belt conveyor for passage to the overhead central station and thence out of the department.

All small parts, except those which are to be nickel plated, are lacquered. They are racked by a workman who then dips the rack in a pot of lacquer. He suspends the rack on a cross bar over the pot to let the excess lacquer drip off, after which he puts the rack on a cross bar in a gas baking oven designed and built by the Detroit Sheet Metal Works, Detroit. The rack containing the parts normally completes a revolution in the oven in 15 min., although the speed can be changed to meet varying conditions. The oven has a temperature range from 130 to 450 deg. Fahr., to handle either lacquered or japanned work.

On a large number of parts entering the manufacture of cash registers, it is often found convenient and necessary to localize the carbonizing and hardening on certain mechanisms: (1) where the part must be strong and ductile to withstand shocks; (2) where machining operations must be performed after the part is hardened; (3) where deformation or warping of the part is likely to take place during the heat treatment. When large quantities of small parts are to be treated, the most convenient and least expensive method is to copper plate them in bulk, to prevent

carburezing of the parts where such a process is not needed. Such parts are copper plated in horizontal plating barrels. Since the average carbonization is 0.020 in., a minimum thickness of copper of 0.0005 in. is required. However, the thickness of copper varies to some extent according to the depth of the carbonization required. After being copper plated, the parts are machined at the points where they are to be hardened.

For localized carbonizing and hardening, barrel-plated copper has been found to be superior to still tank plating. The success of this method of plating is attributed to the dense, compact plate obtained by the burnishing effect of the parts rolling over each other in the barrel.

Work in Process Reduced 60 Per Cent

While the new system of handling parts in connection with the cadmium, copper and nickel plating has been in operation only a few weeks, its merits already are manifest. The time of the work in process has been reduced 60 per cent, or—to put the results in another way—the turnover of material in the department has been more than doubled. By utilizing what was heretofore waste space overhead for the movement of materials, the department has been able to increase its output, even though utilizing a smaller working area. In addition, the necessity for handling parts by hand, except for racking and unracking, has been virtually eliminated and labor costs have thereby been reduced.

In thus revamping the plating departments, the company has proceeded one step beyond the earlier changes in handling its enameling work. These were described in THE IRON AGE of June 14, page 1672. Attention was there directed to the elimination of congestion, the more uniform results obtained with decreased handling, reduction by 80 per cent in stock in process and a substantial increase in output.

Business to Reach Peak in 1929, According to Forecaster

BUSINESS will continue to expand until it reaches a peak in 1929, according to the long-time forecaster of the Simonds Saw & Steel Co., Fitchburg, Mass. Discussing this forecast in the Nov. 1 issue of *Looking Ahead*, Alvan T. Simonds, president of the company, says in part:

In May, 1926, speaking before the financial section of the American Management Association, my assistant, John G. Thompson, basing his forecast upon the accompanying chart, which is our long-time forecaster, declared that business had reached its peak in the spring of 1926 and would decline in its general movement until the latter part of 1927, and then revive through 1928 to its next peak in 1929. Up to date this forecast is correct. It may be found in the printed report of the meeting. He now declares that business is moving to its next peak in 1929, from which it will decline in its general movement until about the middle of 1930, according to how long commercial money rates continue their present general upward movement. He is again basing his forecast upon the chart above. This chart is prepared simply to show trend and that one line moves up and down similarly to the other. No attempt is made to decide upon and show a normal for either line.

I am not going to forecast. I ask each reader of *Looking Ahead* to study the chart for himself. The long dot line represents major movements in interest rates on prime commercial paper in New York as reported in the *Federal Reserve Bulletin*; the solid line represents major movements in the volume of manufacture, as reported by the Harvard

Economic Service; the round dot line represents approximately the line that the volume of manufacture will follow in the immediate future if the sequences shown by the chart up to date are to continue, i.e., if increasing

money rates are to be followed as they have since 1919 by declining volume of manufacture.

The chart shows three downward movements in money rates (remember money rates are reversed on the chart) followed by three upward movements in the volume of manufacture. Today we are in the third of these upward movements in the volume of manufacture, following the downward movement in money rates from November, 1926, to January, 1928. The chart also shows four upward movements in money rates. The first three of these are followed by downward movements in the volume of manufacture. Will the fourth, as shown on the chart from January, 1928, to date, be followed by a downward movement in the volume of manufacture as shown by the round dot line on the chart? The chart shows the facts as found by two reliable reporters of business conditions. Decide for yourself whether the immediate future is to be like the past since the war in the correlation of movements in money rates with movements in business. Certain it is that credit in the United States is in an unhealthy condition. We have lost nearly a half billion of our gold reserves, and at the same time a mania for speculation, based largely upon credit, has developed. In some way or other, sooner or later, we shall have to pay for our spree.

Mass Production Welding Operations

Oblique Welder Prevents Surface Markings—Flash Welder Eliminates Hand Labor—Portable Welders Simplify Jigs—Trolley Conveyor Guarantees Steady Production

BY JOSEPH W. MEADOWCROFT*

A COMPARISON of the various methods used on all-steel automobile bodies (a manufacture designed with welding as its main operation) shows that the following changes have taken place from 1914 to 1928. Arc welds on each assembled body have decreased from 5 to 1 per cent; oxy-acetylene welds have decreased from 48 to 30 per cent; spot and flash welds have increased from 47 to 69 per cent. The reduction in arc welds is due to the change of methods. For instance, the outside door panel was tacked to the assembled inside frame of an all-steel door, but the arc "tacks" required filing off metal at points of contact, this building up being due to the continuous striking of a new arc.

Fig. 1 shows a machine developed especially for this operation. The entire inner panel is energized while the single die makes the weld. This machine, known as the oblique spot welder, due to its indirect means of welding, is designed and built in our own plant. The transformer is of Budd split type, only four bolts need to be loosened to remove the coils. The strands for energizing the inside

panel are of sufficient size to carry the ampere load, and of sufficient flexibility and properly counterweighted to permit the entire welding of the door with one handling. The work is shown in Fig. 2, exactly as it comes from the machine. At the left is the inside, showing spot welds; at the right is shown the clean surface of the outside panel.

Flash welding has been applied in recent years for making long seams in sheets. Fig. 3 shows a machine of standard design, used for flash welding of all two-piece cowls of earlier design, and all roof panel joints in the newer closed bodies. Between the clamps can be seen a roof panel in horizontal position and a quarter panel standing upright. The machine takes 125 kw., is power driven, and fully automatic.

Fig. 4 shows the interior view of the machine used to flash weld the seams of a tonneau. It is also of standard design, equipped with a Budd sizing fixture, and has two individual welding units mounted on one bed plate. Each unit is equipped with one 200-kw. welding transformer, has

*Assistant Works Manager, Edward G. Budd Mfg. Co., Philadelphia. Extracts from an address before the American Welding Society, Oct. 9.

Fig. 1 (at Left)—Oblique Welder. When current comes in through upper electrode it makes a spot weld on flange and flows out through terminal clamped to inner frame. Lower die is insulated and carries away no current

Fig. 2—Unretouched View of Work from Oblique Welder. At left is inner side of seam, showing electrode marks. At right is outer view of door panel, showing not even heat marks at the spot welds

Fig. 3 (Lower Left)—Flash Welder for Roof Panel Joints. If illustration is viewed upside down it will be clearly seen that the work clamped in place is a quarter side panel and roof panel for a coupe

Fig. 4 (at Right)—Looking Down Into the Clamping Fixtures of Flash Welder for Joining Sides to Rear of Steel Auto Body

Fig. 5 (Lower Right)—Toggle Clamps Shown on Floor Are Eliminated by Use of Portable Spot Welders for Assembly Operations

a capacity of 70 in. of 0.043 standard auto body stock and operates by a 2 hp. motor. The weight of the assembled machine is approximately 52,000 lb. The welding dies are of aluminum bronze, to withstand the extreme pressures required to prevent slippage at the weld line. The pressure developed across the face of the dies amounts to approximately 32 tons.

I will give some illustrations of spot welding assembly for front ends. This unit is standard on a line of coupe, sedan, cabriolet and delivery cabs, thus demanding exceptionally high production. Various difficulties have been eliminated by our manually operated "welding conveyor."

The most important operation of the entire assembly is to locate properly the partly assembled outside shell to the interior strengthening or supporting framework. This was

accomplished by jiggging the sub-units in an assembly fixture by means of loose toggle clamps. An improvement in this feature has been the installation of portable spot-welding machines of standard manufacture. Two of these in the hands of operators are shown in Fig. 5; the toggle clamps on the floor are no longer needed. A few spots are placed at fixed points by each operator and the piece is removed. We have found a decided improvement in applying the portable spot welding machine in the line, as it has eliminated a large number of toggle clamps along with the maintenance that they ordinarily require. Another advantage to be found in this assembly method is that once the

pieces have been properly alined and tacked in place by means of the portable welding machine, no further attention is required, as it will undoubtedly be in perfect alinement when completed.

Fig. 6 shows the unit passing through one of a number of operations on the high production side of the conveyor. The length of track is 296 ft., and accommodates 19 standard upright welding machines. Space is provided between the welding machines, allowing one or more pieces to hang in a neutral position, where any small parts are assembled by jigs to the main unit. The hanger shown is very flexible, allowing the unit to be turned into any required position. This is characteristic of all other operations, as no helpers are required. The trolleys support a sheave wheel or pulley permitting the unit to be placed at such different heights as the various operations may require. The figure also shows that the operator has freedom of both hands. The welding operator along the conveyor is assigned to a certain task and his entire efforts can be localized to this task, in that he is not hampered by a helper moving the piece in a directly opposite position to that desired; neither are his thoughts distracted by the following piece, as ample space is provided between each machine to accommodate at least one piece in a neutral position.

All obstacles encountered in the welding line are overcome in the following manner:

1. Sufficient machines are provided along the conveyor to split up or divide any operation by time study so that the amount of production expected from each operator is equalized.
 2. The piece is carried along on hangers that permit any position to be attained. Where a desired position is not possible, the machine is reconstructed.
 3. Space is provided, where necessary, between the welding machines where the setter up is located. He applies the jig and piece, and the jig is returned by the operator. Enough jigs are provided.
 4. A minimum amount of floor space is required on high productions as no bank of material exists between operations.
 5. A minimum amount of handling eliminates damage and dents in the completed unit.
 6. A ceiling switch leads to a duplicate line of machines, the one side manned by a skeleton crew. From the latter experienced operators are drawn to keep the main line in full operation (110 units per hour) at all times.
- In this explanation of our welding line conveyors I have attempted to illustrate the mass production by welding and

Fig. 6—One of the 19 Machines Required to Assemble Front Ends of Auto Bodies. Slight pressure on foot treadle starts an automatic cycle which completes one spot weld

the difficulties encountered in the handling of a bulky piece. Our method of spot welding is the ordinary one established many years ago, but our application in this respect is entirely new. Large production has been handled by this method for the past two years and it is needless to say that our first thought, in lining up new production, is to establish a welding line conveyor. By means of this production device we have solved the following problems:

1. The sequence of operation.
2. The production per welding machine.
3. The many positions of the piece during welding.
4. The jiggling or locating of small parts to the assembled unit.
5. Minimum floor space.
6. The handling of the unit in a manner that will keep it free from floor marks and other defects.
7. The failure of operators to report each shift.

Standard Thermometer and Pyrometer Points

SINCE the determination of absolute temperatures according to the thermodynamic scale is accompanied by great experimental difficulties, the United States Bureau of Standards, the (British) National Physical Laboratory and the German Physikalisch-Technische Reichsanstalt have agreed upon certain fixed points and methods of interpolation for reproducing the theoretical scale for practical purposes. Details of the methods of determination and interpolation are given in Research Paper No. 22 of the Bureau of Standards, by George K. Burgess, director. The primary points all at one atmosphere pressure, are as follows:

Boiling point of oxygen	— 182.97 deg. C.
Melting point of ice	0.000
Boiling point of water	100.000
Boiling point of sulphur	444.60
Melting point of silver	960.5
Melting point of gold	1,063

For temperatures below 660 deg. C. the platinum resistance thermometer is to be used for standard; from 660 to 1063, the platinum thermocouple; above 1063, measurements of black body radiation.

Points intermediate to the above are recommended for calibration of secondary thermometers, as follows:

Carbon dioxide sublimates	— 78.5 deg. C.
Mercury freezes	— 38.87
Transformation of sodium sulphate	32.38
Naphthalene condenses	217.96
Tin solidifies	231.85
Benzophenone condenses	305.9
Cadmium solidifies	320.9
Lead solidifies	327.3
Zinc solidifies	419.45
Antimony solidifies	630.5
Copper solidifies	1,083
Palladium solidifies	1,555
Tungsten melts	3,400

Making of Bolts on a Large Scale

Methods Employed for Mass Production
at the Lebanon, Pa., Plant of
Bethlehem Steel Co.

BY GEORGE A. RICHARDSON*

A PREVIOUS article described the initial steps in the manufacture of bolts and nuts at the Lebanon, Pa., plant of the Bethlehem Steel Co. and continued with the processes required in the semi-finishing and finishing departments for the production of the many varieties of nuts. This article traces the steps taken in the finishing of bolts.

The hot bolt department of the Lebanon plant is largely a jobbing one, for in addition to the usual run of bolts varied heading and upsetting operations are carried on. Rivets to special and Government specifications are made here; likewise all special jobs, such as long guy rods which have to be upset on one end.

The nature of the work here is such that automatic machines cannot be used to advantage, and hence the equipment is hand fed and of a comparatively standardized type. Whenever possible, special machinery is used, a recent development being the installation of drop-in die forging machines, on which the gathering can be done in two or three operations on one heat. For instance, in the case of two

operations, the head will be formed in the first and chamfered in the second. The arrangement of a machine of this type is such that three dies can be mounted on the header, one above the other. Grooves or slots in the side of the frame in front of the header are so located that they are opposite to the dies. The operator takes the heated bar, and, as he pushes it forward against the header, uses one of the slots or grooves as a guide. As the header goes back for the second stroke he drops his rod in the second position and thence to the third position. This speeds up production considerably.

Bolts from 3/16 in. diameter to 2 in. diameter are made in this shop, square and hexagon heads predominating. The bar stock is sheared to the required length on its arrival, heated and upset.

Automatic Machines for Cold Bolts

In direct contrast to that of the hot bolt department, the work in the cold bolt department is carried on entirely with automatic machines. The nature and volume of the work readily lend themselves to this type of production.

*Bethlehem Steel Co., Bethlehem, Pa.

VARIOUS Types of Machines Are Used for Pointing Bolts, Depending Partly on the Size of the Bolts. The semi-automatic pointing machines (below) take care of short bolts up to 3 in. diameter

THE Work in the Cold Bolt Department (Above) Is Done Entirely With Automatic Machines, Which Turn Out from 70 to 125 Bolts per Min., According to Size

Bolts from 3/16 in. diameter to 5/8 in. diameter, inclusive, can be made from stock in cold-drawn coils.

Machines of various types are used, some of the variations depending upon the size of the stock. Equally important are the kind and amount of upsetting required. For instance, in one row there are single-stroke, two-stroke and triple-stroke machines. In a single-stroke machine the operations are as follows: Gripping dies open and as the stock advances, close again tightly, while the material is sheared to length. The sheared piece of stock is then moved side-wise opposite the header, which comes forward and forms a head. The gripping dies then open, the bolt is pushed out and drops on to a belt conveyor which carries it to the container. In the case of the double-stroke machines there are two dies mounted on the header. On the first stroke an upsetting die comes forward and upsets the end of the material. During the back stroke the header rises so as to bring the second die in position, and on the next forward stroke the final heading is done. The header then drops to its initial position and the operations are repeated. In a triple-stroke machine there are three dies and three strokes in all.

Rivets from 3/16 in. to 1/2 in. are regularly made and 5/8 in. diameter rivets are occasionally made on a single-blow machine. Rivets are always annealed. For the general range of bolt-making operations, the double-stroke machines are used, but where large, thick heads are required the triple-stroke machine gives the best results.

Annealing is done after cold heading to remove forging strains. All bolts and rivets are annealed or heat-treated.

Some idea of the production of machines of this character can be gained from the following figures: Speed of operation of machines making bolts: 1/4 to 5/16 in. diameter,

125 bolts per min.; 3/8 to 1/2 in., 86 bolts per min.; 1/2 to 5/8 in., 70 bolts per min.

Miscellaneous Work Done in Threading Shop

No. 3 threading shop can be called the rod and turnbuckle department, for here are made rods, turnbuckles, clevises, etc., mostly for bridge, dock and wharf work. The miscellaneous nature of the operations involved intimately ties up the routine of this department with that of a number of others. A few examples give an idea of this:

Billets for turnbuckles are sheared at the mill and drop-forged in the forge department. The flash or fin formed during the forging operation is trimmed, both inside and out on a cold press or cold punch machine in the threading department, where the necessary drilling and tapping is also done.

Rods are rolled at the 10 in. or other mills and sheared to desired length in the threading department. All remaining operations such as upsetting, threading and placing nuts, turnbuckles or clevises are done here.

Clevises are made on a large hammer in the smith shop, trimmed hot and then sent to the threading department for drilling. They then go back to the smith shop to be "set" or "formed" to customers' requirements and return a second time to the threading department for final finishing.

The equipment of the threading department consists of standard types of forging and threading machines. The nature of the work precludes the use of automatic machinery. Facilities are provided for threading jobs up to 4 in. diameter. In addition to the specialties already mentioned, sleeve nuts, street railway tie rods, both round and flat, various types of guy rods, straps, eye-nuts, etc., are made here. An interesting example of the special jobs which go

through here is a four-part tie rod for dock use, having a clevis on each end and two turnbuckles between.

Material that is to be finished in the finishing department is transferred by rail. All materials are assembled in individual containers in a room set apart for this purpose and loaded on buggies hauled by an electric locomotive on a narrow-gage track.

The remainder of the work of the finishing department has to do with finishing bolts. Although this work is divided, large bolts being handled in the middle bay and smaller bolts in the south bay, the general nature of the operations is the same, and one description will suffice for two separate and distinct units. As mentioned, large bolts are those $\frac{5}{8}$ in. in diameter and upward. All material comes in at the upper or west end of the bays, where it is unloaded and despatched by crane to machines for the first of the operations which are described in their relative order, as follows:

Trimming.—The nature of the trimming operation depends on whether the bolts have been made cold or hot. Bolts up to $\frac{5}{8}$ in. diameter are made cold and have a round flat upset for a head. This is trimmed to a hexagon or square, as desired. In the case of bolts made hot, the flash or fin formed in the forging operation has to be removed. In the middle bay most of the bolts, by reason of size, have been made hot.

Two types of trimming machines are in use. Standard bolts are trimmed on automatic machines; special bolts on hand fed machines of simpler design. The hand fed machines are semi-automatic in their action, and are made in

several sizes. A revolving drum is provided. Near each end and properly spaced around the circumference are holes which serve as position locks. Trimming dies are mounted around the circumference of the middle of the drum, and in the course of rotation the bolts are set shank downward in the dies by hand. At the top point of travel spindles come down into the locking holes and hold the drum in position. At the same time a punch comes down and pushes the bolt through the die. The bolt in turn drops out on a scrap separator where the scrap is removed. On the smaller machines of this character handling bolts up to $\frac{1}{2}$ in. diameter by 6 in. long, as a maximum. One man can trim 35,000 bolts per day.

Bolts Trimmed by Automatic Machines

Bolts to be trimmed are brought to each automatic machine by crane in containers and dumped into the large storage bin located directly above the operating mechanism. They feed down into an open hopper in the middle of which a knife-like device moves up and down. This blade is known as the center board, and is made up of two plates kept apart by separators so that there is a slot in the top edge. The width of this slot depends upon the size of the bolts that are to be handled, and different center boards are provided for each size. As the center board moves up through the hopper, some of the bolts fall into the slot and hang on the edges by the head. A continuation of the upper travel makes the slope of this slot great enough so that the bolts slide down to the lower end by their own weight, and enter a small chute or track which serves as a

AUTOMATIC Heading Machines (Right) Facilitate Rapid Production. On some machines of this type the head will be formed in the first and chamfered in the second

AUTOMATIC Vertical Pointing Machines, Equipped With Two Rotating Spindles, Point a Maximum of 80 Bolts per Min. for Each Spindle (Left). Nine of these machines, operated by two men, point about 300,000 bolts per day

continuation of the slot. At the junction of the slot with this track a mechanical monitor stops the progress of all bolts not properly delivered and returns them to the hopper. From the lower end of the track, the bolts are transferred one at a time to the header by a series of mechanical motions that appear almost human. A cut-off clevis holds back the descending blanks and at the proper instant by a rocking motion separates and releases the lowermost bolt, allowing it to fall into the spring jaws of a carrier or transferring finger device. This finger picks up the bolt which is hanging downward with the head up, turns it through an angle of 90 deg. during the transfer period and places it in a header in a horizontal position with the head out. The header then comes forward and pushing the bolt

TWO Types of Trimming Machines Are Used, the Automatic, Shown in the Illustration, and Hand Fed Machines of Simpler Design for Special Bolts. About 18,000 bolts per day can be trimmed on these machines, two of which are operated by one man

through the trimming die causes the head to be trimmed and the bolt ejected at the front of the machine. Scrap drops underneath.

About 18,000 bolts per day can be trimmed on these machines, two of which are run by one man. The slowness in operating speed is offset by the improved quality of the work, resulting from the fact that the punch does not run into the die.

Work of a miscellaneous character is also handled in the trimming department. Normally, boat and dock spikes, etc., are pointed hot while making. Occasionally, however, pointing cold is called for and in this case the work is done here with a punch type press provided with a taper die. Machines adapted to this use are also used for bending U-bolts.

Tumbling.—All bolts are tumbled after trimming for cleaning and to get rid of burrs and sharp edges. Sawdust is used for cleaning, and a riddle at the discharge end of the tumbler separates all scrap from dirt. The bolts themselves drop on an inspection belt.

Pointing and Threading.—These, of course, are important operations. The types of machines are numerous. Their use depends partly on the size of the bolts and partly on other conditions. Some are automatic, some semi-automatic and a few are hand-operated. For simplification these descriptions will be grouped on the basis of type as follows:

(a) **Automatic Vertical Pointer.** These machines are provided with two rotating spindles moved alternately up and down by a rotating cam. On the ends of the spindles are heads containing the pointing dies. Bolts feed automatically and as the spindle comes down the pointing is done. On the up stroke a slide comes down and pushes the bolt out of the machine. A maximum of 80 bolts per min. can be pointed by each spindle. There are nine of these machines in all, operated by two men. The average production is in the neighborhood of 300,000 bolts per day within size limits $\frac{1}{4}$ to $\frac{5}{8}$ in. diameter x $\frac{3}{4}$ in. to 4 in. long.

(b) **Automatic Vertical Threader.** The only point of difference from the above machine lies in the dies. Spindles rotate at a speed of 450 r.p.m.; oil pressure 60 lb. Two men and eleven machines average 110,000 bolts per day. Size limits $\frac{1}{4}$ to $\frac{3}{8}$ in. diameter x $1\frac{1}{2}$ to 4 in. long.

(c) **Automatic Pointing and Threading Machine.** Both operations are performed on the same machine. Bolts feed down a runway and are carried over to the die head by a conveyor. At this point, a jaw-grip holds the bolt steady while it is raised in a horizontal position. The pointing tool comes up against it first and is followed by the threading head. Sixteen of these machines average 70,000 bolts a day. Only $\frac{1}{2}$ -in. bolts are handled in lengths ranging from $2\frac{1}{4}$ to 6 in.

Semi-Automatic and Special Machines

(a) **Pointing Machines.** Special job lots are pointed on hand-operated machines, which have a capacity of about 20,000 bolts a day. Short bolts up to 3 in. in diameter are taken care of on semi-automatic machines which handle about 30,000 a day. Large work is pointed on a rotating turret, 18,000 a day being an average output.

(b) **Pointing and Threading.** Among the special machines are some designed for handling long bolts. The pointing is done first, followed by the threading; 9000 bolts a day can be machined, lengths ranging from 6 to 36 in.

(c) **Thread Rollers.** In addition to the cutting method of threading, many bolts are threaded on thread rolling dies. Standard cold-made bolts $\frac{3}{8}$ in. diameter and smaller are threaded on hand fed roll threaders. Thirteen machines, each with a capacity of about 30,000 bolts per day, can handle almost any length in diameters ranging from $\frac{3}{16}$ in. to $\frac{7}{8}$ in. All of the threading is done cold. Thread rollers of greater capacity will thread cold bolts from $\frac{1}{2}$ to $2\frac{1}{4}$ in. in diameter.

(d) **Gimlet Pointing.** Some orders call for gimlet points. The machines used for this purpose have a stationary die which is moved forward by hand at an angle against the revolving bolt. About 12,000 a day can be pointed, diameter range $\frac{1}{4}$ in. to 1 in.; maximum length, 46 in.

(e) **Miscellaneous.** Miscellaneous jobs are threaded on hand fed threaders. Quite a few varieties of miscellaneous work are done in this same department. For instance, any drilling required for cotter pins can be done economically on a production basis. Turned and finished bolts and bolts made of special steel are worked up and threaded on stud machines and turret lathes. Stud bolts can be threaded all over; accuracy of threading is obtained by use of a lead screw. Head shaving machines are provided to meet the needs of work of that character.

All cold bolts are treated and blued, the process used cleaning the surface, increasing the strength, relieving strains set up in heading and giving a black finish that prevents rust. One of the advantages of this process is that a clean bolt is obtained for packing.

Special Steels for Special Purposes

Requirements of the Aircraft Industry Are Broad and Exacting—Alloy Steels for Rust and Heat-Resisting Purposes

THERE were two papers presented at the thirty-fourth general meeting of the American Iron and Steel Institute in New York on Oct. 26 on special steels for special purposes. One was a paper by Dr. W. H. Hatfield as noted below. It was read by title only because

it was not possible for the author to be present. Doctor Hatfield delivered the Campbell memorial lecture before the American Society for Steel Treating at Philadelphia on Oct. 10 and in THE IRON AGE of Oct. 18 a brief biographical sketch of him was published.

Steel Requirements of the Aircraft Industry

BY H. J. FRENCH

WHILE the tonnage requirements for steels used in the construction of actual flying equipment will probably remain small, quality steels are used, whose value per unit of weight is relatively high. The business secured during the first seven months of 1928 from the aircraft industry has led one steel manufacturer to conclude that the demand during 1929 will be not less than 1500 tons of alloy steels for engine parts, 3000 tons of alloy steel for tubing, 100 tons of alloy steel for bearings and 50 tons of alloy steel sheet and strip. The total has a market value of about one million dollars.

Stated in terms of airplanes the recorded and estimated production is as follows:

Year	Number of Planes	Value
1926.....	1,200	\$8,900,000
1927.....	1,828	14,130,000
1928.....	7,000	

Over 10,000 engines will be built in 1928, one manufacturer producing 160 per month.

Disregarding the steel demanded for manufacturing plants, tools and equipment, and for hangars, flying field and service stations, the technical requirements fall into two natural groups: (a) for engines and (b) for aircraft structure.

There are three general requirements for steels used in the construction of actual flying equipment. They should have (1) high strength per unit of weight to permit lightness in the craft; (2) high quality to insure reliability and satisfactory performance; (3) ease of fabrication; and sometimes (4) the ability to meet special performance or maintenance requirements.

As shown in the table, hard drawn wire has the highest strength per unit of weight of any of the commonly used materials of construction. The strength-weight factors of heat-treated alloy steels are about the same as some of the light alloys. However, the latter have a higher bulk modulus; for equal weight and strength the aluminum alloy parts will have a greater thickness and therefore have greater rigidity (stiffness) than the corresponding steel parts.

Aircraft steels must have a high order of purity, cleanliness and uniformity. Inspection can make or mar the reputation of the products. In individual cases each bar of steel, for such parts as piston pins, may be analyzed chemically and the treated parts each examined for flaws and hardness. Crankshafts and connecting rods are generally etched at some stage of manufacture to assist in the detec-

tion of minute imperfections, and finally ground or polished all over. For some time, one steel manufacturer has examined microscopically for inclusions all alloy steel billets intended for high-strength aircraft engine parts such as crankshafts. The commercial production of such super-clean steels requires modifications in mill practice and the trend has been toward the electric furnace product, since it is difficult to meet these requirements regularly with open-hearth steels. In some cases cleanliness has been obtained at the expense of other desirable properties. The super-clean steels are generally coarse grained and are difficult to heat treat without cracking. Impact values of the quenched and tempered steels also may be low and the forging ranges are narrow.

Strength-Weight Factors and Elastic Moduli of Wrought Metals Used for Aircraft

(Approximate Values in Tension)

Materials	Elastic Moduli, Million Lb. per Sq. In.	Strength, Lb. per Sq. In.	Specific Gravity	Strength per Unit of Weight Divided by 1000
Music wire, $\frac{1}{8}$ -in. diameter	27 to 30	325,000	7.85	42
Structural alloy steel, heat treated.....	27 to 30	100,000 to 200,000	7.85	13 to 25
High nickel-chromium corrosion - resistant steels	27 to 30	100,000 to 150,000	7.85	13 to 19
Duralumin (4 Cu, 0.5 Mg, 0.5 Mn, 0.25 Si, balance Al).....	10	55,000	2.85	19
Magnesium alloy (4 Al, 0.4 Mn, balance Mg) ..	5 to 6	35,000 to 45,000	1.77	23
Mild steel, normalized. .	27 to 30	55,000	7.85	7
Aluminum, annealed....	10	12	2.7	4.4

At present there are two schools of thought, one holding that present good commercial qualities should be utilized; the other contends that the best is none too good for this stage in aircraft development, when standards of performance and reliability are being developed. The latter school seems to be in the majority, and if the steel manufacturer will look upon the aircraft industry as a testing laboratory and utilize the lessons it will teach in obtaining cleanliness, uniformity and special properties, at least a part of the older industry will learn much about steel making and about the application to quantity production of some of the information now available but not applied.

Corrosion is one of the most important problems to be defeated, especially in equipment operating over or near salt water. The use of protective coatings may enable the designer to use methods and products which would otherwise

not serve satisfactorily. Corrosion of duralumin gives concern at times, especially near the lower wing hinges on sea-planes. The structure here is somewhat open and may be splashed or covered with salt spray when floating. Corrosion by inter-crystalline attack causes the metal to become quite brittle; frequently this is concentrated near the rivets.

Corrosion in parts working under rapid reversal of stress is especially damaging. Heat-treated nickel-silicon steel, when properly protected, has an endurance limit of 108,000 lb. per sq. in., but when wet with mildly corrosive liquids the piece will endure alternations of stress no higher than 12,000 lb. per sq. in. When corrosion and repeated stress both come into play, only the high-chromium steels can be considered to be in competition with duralumin (with its corrosion-fatigue limit at about 8000 lb. per sq. in.) on a strength-weight fatigue basis. This illustrates why duralumin and stainless steels (not carbon steels) are the competing materials in the airships which the British are reported to be building in parallel. Performance records for these two ships should throw much light on the relative efficiency of duralumin and stainless steel construction.

Slightly over 50 per cent of the weight of an air-cooled motor is steel. Nearly all of it is alloy steel, except the cylinders. Those of the Gnome engines, manufactured in the United States about 1916, were made of about 0.5 per cent carbon steel forgings normalized after forging. Liberty engine cylinders, produced during the early part of the World War, were formed hot from seamless steel tubing or pierced and drawn from forged blanks of steel containing about 0.4 per cent carbon and then heat treated. Steels containing about 0.45 per cent carbon are used in the cylinder barrels of modern air-cooled engines, such as the Whirlwind, Wasp and Hornet. One manufacturer is using nickel steel castings, another is using welded chromium-molybdenum steel, and there is a possibility that the nitrided special steels will find application in cylinder construction. Recent experiments in France showed that the latter work in contact with ordinary carbon steels and aluminum alloys without excessive heating. The wear of pistons and rings was reduced, and oil consumption did not increase as rapidly with continued operation as with ordinary carbon steel cylinders.

Steels used for engine forgings are shown in the table—medium-carbon, nickel-chromium analyses are favored. However, there is no standardization. So long as the required mechanical properties can be secured by simple heat treatment, the chemical composition is of much less importance

than the quality of the steel and the ease of forging and machining. Flaky fractures, hair line seams or cracks, inclusions and lack of uniformity are viewed with suspicion and have probably caused more rejections than chemical requirements.

Exhaust valves are an example of severe performance requirements. Operating conditions vary with the engine but temperatures up to 1600 deg. Fahr. are encountered. Hollow stems filled with oil, mercury or salt have been used to reduce the operating temperatures, and this device, as well as other features of design, has been helpful in prolonging the life of valves. However, there is still need for improved valve steels that will better resist erosion from the hot exhaust gases, have a low rate of oxidation, maintain their hardness at exceedingly high temperatures and permit easy fabrication and the production of hard strong stems.

Valves frequently fail by a portion of the head burning away, by mushroomed stems, by excessive scaling and by cracked heads. Of the many steels used, those shown in the table seem now to have the preference.

The wooden propeller has now been replaced quite largely by the metal, which does not chip and split when operating in snow and sleet. However, metal propellers are subject to fatigue and special attention must be given to the surface finish. Most are made of a forged aluminum alloy containing about 4.5 per cent copper, 0.75 per cent manganese, 0.75 per cent silicon, and the remainder aluminum. Steel propellers have been produced and, according to some writers, are entirely satisfactory for fast planes. However, they have not yet been used to any great extent in America.

There is still a wide difference in materials and methods for fuselage and wing construction, not only due to the different requirements of a small messenger plane and a huge bombing sea-plane, but also due to the practices of the different countries.

In England there has been a tendency to retain wood construction and, where metals are employed, to use steels where possible. Aluminum alloys have gained considerable favor in Germany and France, while in the United States steel and duralumin construction are both widely used.

Even in cases where the required stiffness can be obtained, steels have apparently less chance of successful application in small equipment than in large, since for equal strength and weight the steel parts are so thin that manufacturing difficulties are encountered and corrosion in any degree becomes dangerous. In this country practice varies

†Some makers use 0.60 per cent Cr instead of about 1 per cent.

BORN in New York, H. J. French was graduated in 1915 from the School of Mines of Columbia University. From 1915 to 1918 he was successively a chemist in the Murray, Utah, plant of the American Smelting & Refining Co. and metallurgical engineer for the General Vehicle Co., Long Island City, N. Y. From 1918 to 1919 he was chief metallurgical inspector in the Philadelphia territory for the bureau of aircraft production, United States Army, and subsequently was transferred to supervise tubing work in the Pittsburgh district. He joined the metallurgical staff of the United States Bureau of Standards about 1920, and since that time has been engaged largely in metallurgical investigations relating to both the ferrous and non-ferrous metals industries.

widely, but fuselage and control surface construction is generally either of steel or duralumin, while the wing structure is most often made of wood or duralumin with steel fittings and wires. Steel is used for spars, especially in large units, but the wing ribs are usually of duralumin or wood. The landing gear and engine mounts are generally made of steel but aluminum alloy construction is also found.

Steel construction is generally based on seamless steel tubing with welded joints. Duralumin construction requires riveted joints in formed sheets or tubes, as it is impracticable to secure satisfactory welded joints, and hence requires much handwork. Composite construction ordinarily requires from 25 to 33 per cent of its weight of steel for fittings and wire.

Only a few steels have been generally adopted for stressed members of aircraft. These comprise mild carbon steels in the form of sheets, bars and tubing, medium-carbon steel for forgings and tubing, high-carbon steels for springs and tension wires, chromium-molybdenum steel sheets, bars and tubing. Typical compositions are shown in the table.

The popularity of chromium-molybdenum steel for welded structures is due to a combination of desirable properties. The steel may be readily cold drawn to small-size seamless tubes. Sound welds can readily be produced and, due to the air hardening properties of the steel, the strength of the welds without any subsequent heat treatment is nearly on a par with that of wrought steel. It decarburizes very rapidly and it is the practice to make the steel with somewhat higher carbon than that desired in the finished parts. For this reason difficulties have been encountered in securing the desired mechanical properties on heat treatment, due to excessive surface decarburization which lowers the average carbon content of the relatively thin sections. In light-gage sheets and tubes, as in many engine parts, a high degree of uniformity is necessary, if cracking is to be

avoided in built-up fittings which are now so widely used. Uniform mechanical properties parallel and, at right angles to the direction of rolling, are greatly desired.

Stainless steels have not yet been used extensively for aircraft construction but offer promising possibilities. For example, water-tight pontoon construction is difficult to obtain with duralumin, which tends to corrode at welded joints unless heat treated after fabrication. As heat treatment is generally impracticable, riveted and caulked joints are now used. Satisfactory joints have been obtained in experiments with soldered stainless steels, and this practice is simpler and cheaper than that required with the present aluminum alloys. A limited application of stainless steels is found in engine exhaust pipes and exhaust line valves.

Views of Different Commentators

RAPID expansion in demand for aircraft and the large number of small manufacturers now engaged in building them have been responsible for the diversity of metals and alloys demanded, in the opinion of John F. Hardecker, chief draftsman United States Naval Aircraft Factory, Philadelphia. He decried much of this, pointing out that it involved difficulties and extra expense in purchasing, stocking, and production. If each steel is carried in the range of sizes, shapes, and finishes used by several well-known models, the multiplicity approaches the impossible. Both the Army and Navy realized this situation some time ago and have led the way in reducing the number of different alloys used, without attempting to get ideal steel for every part. Cooperation of commercial builders is now necessary, even if only to standardize the methods of inspection and test to insure an "aircraft" grade of quality which will be suitable for the various uses.

E. C. Smith, assistant general superintendent, Central Alloy Steel Corporation, Canton, Ohio, emphasized that por-

tion of Mr. French's paper which showed that little more than half the metal in an airplane engine is steel. Whether this percentage is to grow or to diminish was, in his opinion, a matter of the relative ability of the steel and the non-ferrous industry to develop the required alloys for such specialized purposes. Consequently it is of the utmost importance that the steel supplied now be nothing but the very best, and capable of passing the rigid military requirements by a comfortable margin. The present steels used are little different from the grades supplied to automobile manufacturers; aircraft required more metal on the order of 200,000 lb. per sq. in. tensile strength. The new carbide tools would probably aid in solving the troublesome machine work on such hard, strong steels. He also felt that the austenitic stainless steel (described by Doctor Hatfield in the same meeting) would be very useful, because of its weldability.

Mr. Smith also gave a detailed discussion of the steel requirements for crankshafts of the multiple-throw and single-throw engines now being constructed. The former requires a longer and bigger forging, therefore a bigger billet and a higher starting temperature. The super-clean steels described by Mr. French, when used for such forg-

ings, must be heated under pyrometric control; otherwise the roller or hammer man would probably overheat them, especially should he rely upon the usual criterion: viz., ease with which the steel fills the roll pass or die.

Drawing a parallel with the electrical industry, Dr. Zay Jeffries, consulting engineer Aluminum Co. of America, said that undoubtedly aircraft will become one of the major influences on the steel industry. Fifty years ago, a prophet would have said that the steels consumed in electrical and magnetic equipment would not likely amount to a large percentage of the total; yet the iron consumed in manufacturing plants and equipment, in generating stations, substations, and transmission towers is a very respectable tonnage. Likewise Doctor Jeffries feels that the chief outlet for steel will be not so much in the aircraft and engines, which will probably favor light alloys, as in manufacturing plants, service stations, airways and landing fields.

He also pointed out that since it is worth about \$40 to save a pound in weight in a plane, the cost of the best steel is justified. Furthermore, since service failures are so liable to cause loss of life, the trend will be to design aircraft for a certain number of safe hours service, and junk them completely at the end of that period.

Rust, Acid and Heat-Resisting Steels

BY DR. W. H. HATFIELD

IN Britain and in Germany substantial progress has been made since the discovery of stainless steel for cutlery, 13 years ago by Brearley, and there are now available chromium and chromium-nickel steels of such mechanical and corrosion-resisting properties that a very wide range of requirements can be fulfilled. Six classes of steels as shown in the accompanying table are the ones now most widely used.

Chromium steels 1, 2 and 3 are of the same class, and if heated to a temperature of 1740 to 1830 deg. Fahr., they harden in proportion to the carbon content. In practice, they are hardened, and then can be subsequently softened by tempering to the requisite condition of mechanical strength desired. These are martensitic steels.

Chromium-nickel steels 4, 5 and 6 are in a separate class. If they are heated to a high temperature and quenched they do not thereby become hardened, but instead are put into a very ductile condition, i.e., they are austenitic steels.

The chromium-steel 2, which is used for general high tensile engineering purposes, is put into the mechanical condition indicated in the table by hardening followed by suitable tempering, in which form it is supplied. In the condition given, it may be machined with reasonable ease and is widely used with success for parts required to resist atmospheric corrosion, superheated steam and many other conditions. It is clear that the next mechanical condition of rustless steel required by the engineering and the industrial world was that in which it could easily be deformed

cold to shape, and the steel given as 3 indicates the degree of success attainable by lowering the carbon content.

However, it was found that the chromium-nickel austenitic steels 4, 5 and 6, fulfilled more completely this particular demand of the industrial world. The heatings sometimes necessary in manipulation do not lead to air-hardening difficulties.

From the mechanical testing point of view, the distinctive feature, apart from their high ductility, is their high impact value, which is generally in excess of 100 foot-pounds (Izod test, British standard conditions).

Particularly noticeable is also the increased coefficient of expansion, and the thermal conductivity; these factors must be taken into consideration where elevated temperatures are encountered. Another outstanding and marked characteristic is the nonmagnetic nature of such materials.

It is quite clear that the service conditions should be thoroughly explored with a view to determining whether the corroding influences at work are such that the steels can be reasonably expected to give a good account of themselves. In the first place the advisability of supplementing laboratory corrosive tests by actual works tests cannot be emphasized too strongly. This is necessary because, in manufacturing processes and under service conditions generally, it is only rarely that pure substances are used, and small amounts of impurities may make a big difference to the corrosion resistance of the steel. For example, in the manufacture of some organic acids, relatively small amounts of mineral acids are also present at times and this may quite easily lead to corrosion. It must not be imagined, however, that small or even large amounts of impurities are always harmful to the steel: they may even be beneficial. To illustrate this, copper sulphate or ferric sulphate when present in certain proportions has the power of preventing the solution of austenitic chromium-nickel steel in solutions of sulphuric acid. Such conditions exist in certain mine waters.

This point is also brought out by the corrosion of certain types of stainless chromium steel in acetic acid solution of the same strength as vinegar and in citric acid solution of the same strength as lemon juice, while remaining totally unaffected by actual vinegar and lemon juice, thus once more illustrating the modification in corrosion resistance brought about by small amounts of an impurity. Substances which may cause corrosion when boiling under normal pressure may be quite harmless if boiled under reduced pressure at a correspondingly lower temperature.

Correct heat treatment is very important. One of the things which has to be aimed at in producing a corrosion-resistant material is homogeneity and incorrect heat treatment may easily destroy this, with consequent setting up of electrolytic corrosion.

Heat-Resisting Steels

Demand is being made for steel of such a nature that its strength does not become impaired as the temperature rises. Ordinary steels have already lost a substantial proportion of their strength when they attain temperatures in excess of a black heat, *i.e.*, 500 to 600 deg. C. While alloys of nickel and chromium have been very successful both in America and Europe, it has been found that, by suitably modifying the composition, the weakening is postponed until very much higher temperatures. In a good heat-resisting steel, however, this maintenance of strength at higher temperatures must be accompanied by resistance to scaling.

In the Campbell Memorial Lecture given earlier in the month before the American Society for Steel Treating the author showed how both characteristics can be controlled. While high-chromium, chromium-nickel and chromium-silicon steels show the advantage from a scaling point of view, the strength at high temperatures is not particularly good, whereas in the case of nickel-chromium steels to which

tungsten or silicon has been added (particularly the former) great gain in strength is obtained without impairing the resistance to scaling.

Theory of Corrosion

Why does iron rust? May it not be that iron protects itself by immediately forming the protective film when brought in contact with certain oxidizing media, and that failure to resist, *i.e.*, progressive "oxidation," results from the puncturing and local destruction of this film through various causes, such as the presence of particles of foreign matter leading to damage through local electrolytic effects and from local concentration of corroding media in dew effects? Incidentally a continuous protective film presupposes a continuous metallic surface for it to form upon, and what with the dispersion of oxide or silicate inclusions of indeterminate composition, and the actual unsoundness of the bulk steel produced, it cannot be considered that such a condition is fulfilled. The author is of the opinion that even ordinary commercial steel can, in itself, be much improved as regards its resistance to corrosion by manufacturing materials free from oxides and gas holes.

In reheating and during rolling, the external oxide layer is formed upon the steel; and attention to the time-temperature effect, coupled with control of the nature of the furnace atmosphere, cannot be without influence upon the characteristics of the surface as regards resistance to attack.

It is difficult to be certain as to the cause of pitting corrosion in all cases, but it seems reasonable to assume that the two conditions required are, firstly, a medium which either does not, or which only just attacks the chief constituent of the metal when pure and under anaerobic conditions, and, secondly, some factor or factors leading to local acceleration of attack. If the first condition is not satisfied, any tendency to pitting will be more or less masked by general attack; and if the second does not apply, the attack will be even. It remains to fix the cause or causes of the local acceleration, and the following, in the light of present knowledge, are suggested as probable:

1. Small areas less accessible to oxygen than the surrounding material will become anodic to the rest of the material, and a condition favorable to pitting will exist. Small surface defects and extraneous foreign bodies may cause trouble in this way.
2. If a metal is normally covered by a protective oxide film, small defects in this film, however caused, may produce local decrease in resistance, leading to pitting.
3. Local concentration of corroding medium (moist crystals, etc.).
4. If a material has small areas differing in some way, either chemically or physically, from the mass of the material, then such areas may supply the accelerating force by electro-chemical means, if they are not so chemically resistant to the medium.

The influence of chromium is now believed to be that of producing the necessary resistance through the spontaneous creation of a satisfactory oxygen-containing passivity-producing film, thus bringing the resistance of these new steels into association with the old phenomenon of passivity, and it is the facility of the chromium of producing, by oxidation through atmospheric and like oxidizing influences, the protective film, which is the explanation of their excellent properties.

Magnetic Changes in Fatigue Specimens

M. F. Fischer reports his studies on the magnetic properties of steel during alternating stresses in the *Bureau of Standards Journal of Research* for November. While magnetic changes were observed, they appear to be due to relief of internal stress, and are of such magnitude as to obscure those magnetic changes directly resulting from a fatigue crack. He concludes, therefore, that a rapid method of determining the endurance limit by means of magnetic analysis cannot be expected.

Blooms Routed in Four Directions

Special Transfer Table Handles Large Quantities According to Analysis in New Tube Plant

QUANTITY production of alloy steels covering a wide variation in analyses involves several problems in the routing and treatment of material. Having once reached the bloom stage, different steels require different treatments before further processing. This gives rise to problems concerning the most economical method of routing large quantities of material, coming from a single source, to any one of several destinations.

For example, in the new plant of the Timken Steel & Tube Co., Canton, Ohio, blooms coming from the shear must be routed, according to analysis, directly to the next rolling operation in the 28-in. mill, to continuous reheating furnaces, to thermal conditioning pits, or to a point where they can be pickled and ground, or chipped, before reheating and rolling. In other words, large quantities of material

coming from one operation must be diverted to any one of four others, with as little possible obstruction to the production stream, either preceding, or subsequently.

In this particular case the solution has been arrived at by means of a chain transfer table. The table, which has an overall length of 81 ft., and a width sufficient to accommodate either two rows of 9-ft. blooms, or a single row of 18-ft. blooms, was built with special regard to the service desired. It is located at right angles to the shear runout table, so that it can handle all blooms coming from the shear, regardless of their ultimate destination.

Table Is Simply Constructed

The construction of the table proper is simple. It consists of a series of heavy rails, acting as skids, supported by a structural steel framework con-

sisting of heavy transverse channel members about 6 ft. apart, which in turn are supported at the ends by structural uprights, which, for greater rigidity, are braced by cross members extending from the top of one column to the base of the adjacent ones on each side. Further rigidity is given to the individual supports by gusset plates at the joining angle of the transverse and upright members. The table has a total rise of 6 ft. from the charging to the discharge end, with a level point about 15 ft. from the end nearest the hot shear, where the runout table leading to the 28-in. mill is located. This arrangement gives the operator a clear view of the blooms on the table during the whole course of their travel over it, from his pulpit over the charging end.

Bloom travel is accomplished by four endless chains, provided with carrying dogs, which extend 4 in.

Transfer Table From the Operator's Control Station

above the surface of the skid rails. The chains are driven from four sprockets mounted on a common shaft at the delivery end of the table, and run over four spring sheave take-up sprockets at the shear table end. The drive consists of a 90-hp. 220-volt compound wound, mill type motor, which drives the sprocket shaft through a reduction unit which gives a chain speed of 150 ft. per min. The motor is provided with a solenoid brake to insure quick stopping when blooms are to be spotted on the run-out tables that deliver them to various destinations.

The four sprockets at the drive end are mounted on a common shaft, which is coupled directly to the main gear shaft of the reduction unit. The sprocket shaft in reality consists of two sections of about equal length, coupled together. Thus either section may be removed, if desired, without disturbing the rest of the assembly. The shaft is supported by five pillow blocks, so located as to give it the greatest possible rigidity. They are equipped with roller bearings. The

mountings are simple, the two bearing cones being pressed on the shaft, and the cups located by a shoulder on the inside of the plate which forms the outer closure, adjustment being obtained by means of shims. The pinion and gear shafts of the reduction unit are also mounted in roller bearings.

The mounting of the take-up sprocket bearings is quite different. The sprocket bearings are located inside the sprocket hub proper, the cups being pressed against shoulders inside the hub, and the cones given a light fit on the shaft. The cones are located by a sleeve which fits around the shaft inside the square sliding block, and are locked in place by nuts on the end of the shaft. The outer closure is formed by a collar on the shaft, that is held against the hub by the outer block.

Operation Is Controlled from One Point

The whole operation, not only of the transfer table, but of the two runout tables connected with it, is

controlled from one point near the juncture of the table with the shear runout table. Thus it is possible for one operator to route blooms coming from the shear to any one of three destinations, according to the treatment they require.

Those intended for rolling without treatment can be sent directly to the rolling mill by a live roll table which crosses the transfer table at a point about 15 ft. from its beginning. Those which require reheating travel to a second live roll table located at the extreme end of the transfer table, which carries them to the entrance of the reheating furnaces. And those which are to be thermally conditioned, or chipped, are carried over the end of the transfer table, and deposited in cradles in which they are carried by cranes to their ultimate destinations. The proper handling of blooms is facilitated by the fact that the operator has a clear view of the whole table from his control station, and can act immediately in accordance with the demands of any situation that may arise.

American Companies to Use Krupp Patent

Ludlum, Firth Sterling and Central Alloy Will Cooperate With German Company in Promoting Chrome Nickel Alloy

AN announcement has been made by representatives of the Krupp Steel Works, Essen, Germany, of the formation of the Krupp Nirosta Co., Inc., which will be the agent in the United States for the Krupp interests, in cooperation with the Ludlum Steel Co., the Firth Sterling Steel Co. and the Central Alloy Steel Corporation, in the production and promotion of chrome nickel alloy.

The announcement was made by Rudolf Preussing and Heinrich Artz, directors of the Krupp Steel Works, before they sailed for Germany on Nov. 1, following their attendance at the fall meeting of the American Iron and Steel Institute.

"The main object of the Krupp Nirosta Co., Inc.," a statement read, "is not to act simply as a patent holding company, but to be helpful as a service company and as a medium for the exchange of helpful ideas along the lines of development. Arrangements have been made so that the licensees, including the Central Alloy Steel Corporation of Massillon, Ohio; the Firth Sterling Steel Co. of McKeesport, Pa.; the Ludlum Steel Co. and others will have an important voice in the direction of its affairs."

The executive committee of the new company consists of J. M. Schlendorf, vice-president Central Alloy Steel Corporation; H. G. Batcheller, vice-president Ludlum Steel Co.; Richard Prosser and Otto van Schrenk. Edwin Corning, president of Ludlum Steel Co., will be chairman of the board and Mr. Batcheller will be president. The directorate will include F. J.

Griffiths, chairman Central Alloy Corporation; Henry E. Cooper, vice-president Equitable Trust Co., New York, and Harold O. Baker of the New York Stock Exchange firm of Jesup & Lamont.

Announcement was also made by the Krupp representatives of the arrangement made with the General Electric Co. for the manufacture in the United States of carbonyl.

H. G. Batcheller, president Krupp Nirosta Co., says that the Ludlum Steel Co. has taken an active part in the formation of the new company because of a belief that concerted action is necessary for the proper development of the chrome nickel alloy to which the Krupp laboratories have so largely contributed.

"For several years," he adds, "we have been interested in the production of the alloy steels, which for lack of a better term are usually described as 'stainless steel.' We have done a great deal of work with the alloys described by Brearley, Strauss, Armstrong and others. The more we study the corrosion resistant problem, the more we become convinced that there is need for great improvement in production methods and that the best results can only be secured by giving great attention to the selection of the proper alloy for each specific purpose. It has also been our experience that such selection must be based not only on complete laboratory tests, but in many instances on actual service tests.

"Several months ago we received an invitation from the Krupp company to send one of our metallurgists to in-

spect its plant and laboratories at Essen. We were much impressed by the remarkable development in Germany of the chrome nickel alloys in which the Krupps have specialized, and we also received many helpful suggestions regarding methods of production.

"Until the happy day arrives when the metallurgists discover an alloy that will cover the whole field of corrosion resistance, we believe that free exchange of ideas is necessary between the various mills producing the several alloys that have come into common use and we hope that the formation of the Krupp Nirosta Co. will represent an important step in this direction."

The Firth Sterling Steel Co. states that its cooperation in the formation of the Krupp Nirosta Co. will enable it to manufacture in this country a type of stainless steel similar to the "Staybrite" steel made for a number of years by Thomas Firth & Sons, Ltd., Sheffield, England.

"This 'Staybrite' type," says the Firth Sterling company, "is highly resistant to the corrosive effects of some of the agencies which affect to a greater or less extent our other stainless steels. The Krupp Nirosta Co.'s patents cover this type of material.

"The other arrangement made between Krupp's representatives and the General Electric Co. covers a new cutting material, and under the arrangement we shall now be able to put on the market our 'Dimondite,' which has a cutting capacity far in excess of any high-speed steel. We expect to announce shortly the details of this new development on which our laboratory has been working for some time, but the marketing of which has been delayed owing to the fact that basic patents were held by Krupps and the General Electric Co."

Surface Grinder Equipped with Oilgear Feed

GRAND RAPIDS No. 5 hydraulic feed surface grinder equipped with Oilgear feed has been designed by Gallmeyer & Livingston Co., Grand Rapids, Mich., to provide more rapid means of doing extremely accurate

movable pointer can be set for convenient readings.

When it is desired to get very accurate readings for grinding to close limits, the fine adjustment comes into play. Turning the smaller hand-wheel

***F**EEDS Up to 55 Ft. per Min. Are Obtainable by Turning a Handle at the Front of the Machine (at Left)*

***T**HIS Steel Frame Shear (at Right) Cuts 3-In. Angles and Weighs 93 Lb.*

work. As gearing of every nature has been eliminated in the movement of the saddle and table, the ground surface cannot show "gear tooth marks." The Oilgear mechanism makes possible practically any longitudinal table speed up to 55 ft. a minute. The feeds may be set so that the entire working surface of the table will be covered in $3\frac{1}{2}$ min.; on the other hand, they may be set so slow that it will take 9 hr. to cover the same surface.

Rigid foundation is provided by a one-piece base casting, which weighs over 1600 lb. The spindle head is a heavy casting fitted to the vertical ways and carrying an extra heavy spindle with a minimum of overhang for the wheel. The spindle runs in heavy bronze bearings, the front being 2 in. in diameter by 8 in. long and the rear $1\frac{1}{4}$ in. in diameter by 5 in. long.

The cross-feed engine may be set to operate at both ends of the reciprocating table stroke or at one end only. It may feed either in or out. The machine may be driven by belt with countershaft or by motor with self-contained drive. It may be arranged for either wet or dry grinding.

Aside from the method of operating the table, the most unique feature is in raising and lowering the wheel head. For rapid adjustment in raising or lowering a considerable distance a large hand-wheel is used. This gives direct action to the elevating screw through a worm and worm gear. The wheel is graduated to 0.00025 in. The

or knurled hand knob in the center of the large hand-wheel provides a back-gear action to the elevating mechanism. The graduated dial ring on the disk in the center of the hand-wheel can be set at zero with relation to the pointer. Both inner and outer wheels turn, but the graduations on the inner wheel read on this pointer with vernier effect. By this means, readings of adjustment may be made in tenths of a thousandth, successive graduation marks being over $\frac{1}{8}$ in. apart.

This size of machine has a table with working surface 10 x 36 in. The automatic table travel is 12 in. transverse and 38 in. longitudinal. Vertical movement of the wheel head is $13\frac{3}{4}$ in., while maximum distance from wheel to table varies from $12\frac{1}{4}$ in. under a 10-in. wheel to $13\frac{3}{4}$ in. under a 7-in. wheel—the minimum size recommended. A motor of 5 hp. is standard. The net weight of the machine with motor, but without accessories or liquid, is 4250 lb.

A code for testing water cooling equipment, such as cooling towers and spray installations, has been drafted by the committee on power test codes of the American Society of Mechanical Engineers and will be presented at a public hearing to be held at the headquarters of the society in New York, Dec. 4, at 2 p. m. Copy of the tentative code may be obtained from C. B. Le Page, 29 West Thirty-ninth Street, New York.

Angle Shear is Operated by Hand

HAND-OPERATED and made with a steel-frame, the angle shear here shown is designed to be light in weight. It is built by the Hendley & Whittemore Co., Beloit, Wis. It will shear angles up to $3 \times \frac{1}{4}$ -in. or $2\frac{1}{2} \times \frac{5}{8}$ -in. It is $14\frac{3}{4}$ -in. high, 15-in. wide, $7\frac{1}{2}$ -in. deep and it weighs 93 lb. without the operating lever.

The shear is provided with two eccentrics and it can be operated either directly, with the hand lever applied to the main eccentric, so that light angles are cut off in one stroke; or it can be operated through the compound leverage, so that heavy angles can be cut with minimum effort. The eccentrics are packed in grease. Shear blades and eccentrics are made of hardened tool steel.

When operated through the compound leverage the hand lever is worked up and down without being

detached or moved from one socket to another. Dogs are provided to take up slack between each stroke and to hold all the cut gained by each stroke.

Paint for Zinc Coatings

A paint for galvanized iron known as "Gun Metal Liquid" is being marketed by Liquid Metal Products, Inc., 231 South La Salle Street, Chicago. It is said to bond instantly with newly galvanized metal, and produce a surface which is corrosion resistant in itself. At the same time it may serve as an undercoat for other paint. It may also be used on metal advertising signs, as paste adheres to it firmly.

A concession for chromium mines at Eski-Shehir and vicinity, Turkey, is being sought by Swedish interests. The ore runs 43 to 50 per cent metal and the bed is crossed by the Anatolian railroad, which is expected to help reduce the cost of mining.

Adapts Friction Saw for Longitudinal Cutting

IN making guard rails the Interborough Rapid Transit Co., New York, employs the special high-speed friction saw illustrated, which is arranged to cut a strip 33 ft. long from a portion of the base of discarded 100-lb. standard rails.

The machine was built by Joseph T. Ryerson & Son, Inc., Chicago. A 56-in. diameter, $\frac{1}{4}$ -in. thick, special steel friction saw blade is used, and cutting is at the rate of $4\frac{1}{2}$ to $6\frac{1}{2}$ ft. per min., depending upon the speed

of the feed motor employed. It is stated that a clean cut is made through the entire length of the rail in 5 to 7 min.

The machine has an arc welded steel frame and runway upon which the saw carriage travels. The carriage, also arc welded, carries the 100-hp. friction-saw motor and blade, as well as the 3-hp. motor and reduction unit for propelling the carriage back and forth on the runway. A 70-gal. pump driven by a $7\frac{1}{2}$ -hp. motor supplies

water at 150 lb. pressure for cooling the blade. As the machine moves back and forth on the runway, the pump picks up water from a trough at the side of the frame. Water from the saw blade is collected by a concrete installation and returned to the trough through a system of baffle plates.

The operating power, direct current varying from 550 to 650 volts, is taken from two overhead poles. Two trolley poles are employed so that the machine itself is not used as a return for the motor current. With this arrangement the motor bearings and other movable parts of the machine are not required to carry the current and the possibility of accident is avoided. The machine itself is grounded but a separate return wire from the motor carries the current back to the overhead trolley.

Rails to be cut are held by means of five individual air clamps which are arranged so that the rails can be pulled down into them from skids without the assistance of overhead crane equipment. Rollers are provided on the skids so that the rail can be moved forward or backward after the cut to remove it from the clamps. The clamps are powerful enough to straighten the rail during the cutting operation. The operator rides along on the carriage, from which he can watch the work conveniently. All controls are located within easy reach from the operating position.

Horizontal Boring, Drilling and Milling Machine

A NEW table type horizontal boring, drilling and milling machine, designated as the No. 50, of increased range and capacity, has been brought out by the Giddings & Lewis Machine Tool Co., Fond du Lac, Wis.

The bed is of massive box-type construction, the weight of the standard bed being in excess of 15,000 lb. The ways are 13 in. wide, are relieved in the center, and measure 48 in. over the outer edges. The Giddings & Lewis method of bolting, tonguing and doweling the column to the bed unit has been employed on this machine, a large tongue being machined integral with the bed for this purpose. The column is of heavy box section, well ribbed in both directions.

Although considerably heavier, the table and saddle unit is of the same general design as that of the company's No. 45 machine. For making adjustments between the table and the saddle two taper gibs are provided, one at each end. The screw for cross feed of the table is mounted on ball bearings and is arranged with adjustable graduated dials on each end. The Bowen system of lubrication is standard equipment for oiling the ways, gears and bearings of this unit. One stroke of the plunger supplies lubricant to all parts, regardless of the position of the table.

The spindle head is massively built and the main casting is of one piece to

furnish solid support for all moving parts. The head unit has been made compact to permit close observation of small work. This unit is automatically lubricated, a constant flow of oil being furnished to all parts by a positive-driven pump located in the head.

Speeds and feeds are obtained through sliding gears and jaw clutches

contained in separate units mounted on the bed and running in oil. Changes in speed and feed are accomplished through levers easily accessible from the normal operating positions. All gears are of chrome-nickel steel, case hardened, are of wide face and have the teeth rounded to facilitate meshing. Bevel gears in the speed train are of spiral tooth form. The main

Increased Range and Capacity Are Features of the New Machine

shafts of the speed box are mounted in ball bearings. Power is furnished to the machine through two "twin disk" friction clutches, which makes the machine adapted to tapping operations. A gear change quadrant is included in the feed gear train so positive leads can be had for tapping and threading. The machine can also be supplied with the G&L precision measuring device.

Some of the principal specifications are: Longitudinal travel of spindle,

64 in.; vertical adjustment of the head on standard column, 64 in.; working surface of the table, 60 x 96 in.; maximum distance from face of spindle sleeve to end support with standard bed, 120 in.; and cross travel of 60 x 96-in. table, 86 in.

Spindle speeds, in either direction, number 24 and range from 5 to 245 r.p.m. The number of feeds per revolution of spindle is 18. The approximate net weight of machine is 45,500 lb.

Hot Strip Shear Makes 30 Cuts a Minute

A DIRECT-CONNECTED hot strip shear, which exerts a pressure of 250,000 lb. between the knives and is designed to cut a hot steel strip 48 in. wide by $\frac{1}{4}$ in. thick, is a late development of the United Engineering & Foundry Co., Pittsburgh. It has a

at the proper point in the cycle to stop the shear at the end of its return stroke. The top knife block, which is operated through an eccentric shaft and pitmans, has adjustable bronze shoes for taking up the wear in the housing slides. The drive, entirely in-

Each Cut on This Shear Is Made by Starting the Motor, Which Stops After the Cut Has Been Made

stroke of $3\frac{1}{2}$ in. and is geared to run at a speed of 30 cuts a minute. "Direct-connected" means that no clutch is used; the motor is connected by a flexible coupling direct to the drive, each cut being made by starting and stopping the motor.

This is done through an electrical control which, in the case of this shear, is said to work perfectly. The operator presses a push button to start the motor. A limit switch coupled to the eccentric shaft then controls the shear for the remainder of its stroke, throwing out the coils and allowing the friction brake to function

closed, is provided with continuous oiling.

Motor-driven pinch rolls, controlled by a solenoid, are placed on the entering side of the shear. The drive for these pinch rolls, also entirely inclosed and connected with the continuous oiling system, is beneath the main motor base, at the left of illustration. The pinch rolls are connected with the drive by spindles and couplings.

Neither motor is shown, as all electrical equipment for operating the shear is usually supplied by the purchaser.

Adds Small Machine to Line of Bending Rolls

RAPID operation is a feature of a new vertical type bending roll which has been placed on the market by the Buffalo Forge Co., Buffalo. The machine is designated as the No. 0, and is the smallest of a line of similar machines made by the company.

The frame of the machine is a one-piece steel casting and the legs and table are of arc-welded steel construction. The rolls may be adjusted conveniently by means of three hand-

operated cranks, and the arrangement is such that they may be changed in a few seconds. Bronze bushings are employed throughout and lubrication is by means of the Zerk system. A quick-acting clutch facilitates operation. For motor drive a 2-hp. 1200-r.p.m. motor, with switch box and push-button control, is used. The machine can be arranged also for belt drive.

Capacities are as follows: Angles, leg out, $1\frac{1}{4}$ x $\frac{3}{16}$ in., minimum di-

ameter 7 in.; smallest angle, leg out, $\frac{1}{2}$ in. x $\frac{1}{8}$ in., minimum diameter 6 in.; flats, on edge, $1\frac{1}{2}$ x $\frac{3}{8}$ in., minimum diameter 7 in.; flats, on edge, 2 x $\frac{3}{8}$ in. to $2\frac{1}{2}$ x $\frac{1}{2}$ in., minimum diameter 6 in.; rounds, $\frac{7}{8}$ in.; squares,

The Frame Is a Steel Casting and the Legs and Table of Arc Welded Steel

$11/16$ in., minimum diameter 6 in.; copper tubes, No. 12 gage, 1 in.; copper tubes, No. 16 gage, $1\frac{1}{4}$ in.; standard pipe, $\frac{3}{4}$ in., minimum diameter 6 in.

The length of the machine is 3 ft. 10 in. and the width and height are 2 ft. 6 in. The weight is 75 lb.

Portable Grinder with $\frac{1}{2}$ -Hp. Motor

ONE-HALF horse-power portable grinders and buffers, equipped with ball bearing motor and Timken roller bearing grinding spindle, have been added to its line of electrical portable tools by the Hisey-Wolf Machine Co., Cincinnati. They are built for 110 and 220-volt current supplies,

Portable Grinder Carries 6-In Wheel

and for 1-phase or 2-phase currents as well as direct current. The size of wheel taken is 6 x $1\frac{1}{4}$ in., with a $\frac{3}{4}$ -in. hole.

Employment in the metals industry in the Middle West showed an increase, but employment on the whole showed little change for the period of Aug. 15 to Sept. 15, according to a report by the Federal Reserve Bank of Chicago. The metals group showed an increase of 1.9 per cent in the number of workers, whose earnings increased 1.2 per cent.

Two New Oxy-Acetylene Shape Cutters

TWO new devices for cutting irregular shapes in steel plate have recently been placed on the market. One is introduced by the Linde Air Products Co., New York, and known as the Oxweld shape-cutter. Speed ranges from 3 to 20 linear in. per min. depending on the thickness of the metal being cut; and it is said that accurate, smooth cuts requiring a minimum of machining can be made in slabs 12 in. thick. In this machine the cutting blowpipe is mounted on a carriage which is moved in any desired direction by means of an electric motor. For routine production it will operate automatically from templets made of strip metal. The driving mechanism is similar to one illustrated to greater scale in *THE IRON AGE*, Aug. 30, page 521. Where only a few parts are to be cut out, a hand tracing device can be attached and used to follow the outline of a full sized sketch or blueprint.

Another device which is designed to minimize lost motion in transmitting the required direction to the cut-

ting blowpipe has been recently developed by General Welding & Equipment Co., Boston. A substantial base 1 and a short column 2 support a well balanced track system 3. By means of a roller and ball bearing system it can easily turn around this column. On this track are mounted two carriages 5 and 6 of equal weight, one carrying in its center the tracing and driving element and the other the cutting torch. The carriage centers are set equidistant from the main center, and two racks 7 and 8 engaging a gearwheel 9 will always keep the carriages equidistant from center when moving in and out.

The combination of the straight movement of the carriages with the turning movement of the track system enables the tracer to follow any path, which in turn compels the tool to reproduce this same movement correctly. By running the long racks over two coupled gearwheels of different diameters, the machine can proportionally enlarge or reduce the pattern to any desired proportion.

THE General Welding & Equipment Co. Cutting Machine Has a Rack and Pinion Drive

OXWELD Shape Cutter Automatically Drives Oxy-Acetylene Blowpipe Around Any Full Sized Pattern (Below)

Compact Welding Set for Isolated Service

A SELF-CONTAINED gas engine-driven arc welding set, designed particularly for pipe line construction, structural steel work, railroad con-

Welding Set Mounted on Skids, for Field Service

struction and general welding service in isolated places where electric power is not available, is a late Westinghouse development. Its overall dimensions are: length, 73 in.; width, 25 in.; height, 46½ in. The approximate net weight is 1700 lb.

The complete set consists of a model P-20 Continental gas engine, direct-connected with a new type Westinghouse 200-amp. arc welding generator, with direct-connected exciter overhung from the generator bracket. To provide greater compactness, the generator has a special bracket which fits into the engine housing. Protective covers over the generator, commutator and engine head make the complete equipment weather proof without a canopy. The engine and generator, complete with all controls, are mounted on an all-welded channel base. The equipment may be made suitable for either stationary or portable use.

The four-cylinder engine is rated at 24 b.hp. at 1450 r.p.m., the generator speed. A Zenith carburetor with friction-type choke is operated by a positive centrifugal-type governor. The lubricating system is pressure fed by a gear-type pump. A centrifugal water pump and liberal radiator capacity provide efficient cooling.

The generator is a special type S.K., constant current, differentially compound wound machine. It is rated at 200 amp., 1 hr., 50 deg. C. rise, on a resistance load at 25 volts, in accordance with N.E.M.A. standard practice. The field rheostat, ammeter and voltmeter are all mounted in a control cabinet on top of the generator frame. The welding range is from 60 to 300 amp.

For determining the condition of acid pickling tanks, an inexpensive device known as the H. K. chemical test set is being marketed by the Research Mfg. Co. of the Ellwood Ivins' Tube Works, Oak Lane Station, Philadelphia.

Harbison-Walker Make Plant Improvements

During the past year the Harbison-Walker Refractories Co. embarked upon an extensive building program which will require several years for completion. Three plants have been completely remodeled, the clay brick plants at Templeton and Clearfield and the silica brick works at East Chicago, Ind.

The last mentioned is of special significance, in that it has a tunnel kiln of German design that has been successfully used in burning silica brick at Düsseldorf, Germany. It is 550 ft. long, fired with producer gas, and is of the regenerative type. It was designed for a daily output of 30,000 9-in. bricks or the equivalent. A pyrometric system serves to secure accurate control of the temperatures in every part of the kiln. A large proportion of the brick in this plant is made in a machine especially designed for the molding of silica brick.

At the Templeton and Clearfield works there are two 444-ft. Dressler open-fire tunnel kilns at each plant, together with Boyd presses, remodeled grinding, screening and storage units and wet pans with a new type of disintegrators to prepare clay for the presses. The plants have been electrified, with speed reducers for elevators, conveyors and car pullers, and equipped with overhead monorail for handling coal and ashes, automatic stokers for firing coal, and vacuum cleaners for cleaning kiln cars.

To Build New Brass Plant in Cleveland

Chase Brass & Copper Co., Waterbury, Conn., will erect a brass and copper manufacturing plant in Cleveland to supply its mid-Western trade. This company produces brass pipe, sheets, rods, wire tubing and other brass and copper products and distributes these products through a system of warehouses, one of which is located in Cleveland.

Scrap Institute Continues Organizing Chapters

An international organization of scrap iron dealers was urged by Henry Rothschild, senior member of J. Adler, Jr., Inc., large German dealers, at a meeting of the New York chapter of the Institute of Scrap Iron and Steel, at the Hotel Astor, Oct. 30. Mr. Rothschild said that the scrap iron dealer of Germany was the first to resume business relations with the former enemy countries, because of the necessity of providing the basic material for the steel mills. He said that the Institute of Scrap Iron and Steel might be used as the basis of formation of such an international organization.

At a meeting of New Jersey scrap iron and steel dealers in Newark, N.

J., Oct. 29, a fifth chapter of the institute was organized with Michael V. Bonomo, Schiavone & Bonomo Brothers, Jersey City, president, and A. Isaac, Elizabeth, N. J., chairman of the executive committee.

Chase Company to Build Cleveland Mill

The Chase Brass & Copper Co., Waterbury, Conn., has selected Cleveland as the site of a brass and copper plant to serve the Midwestern territory, according to an announcement by F. S. Chase, president. Suitable location has been secured and the first buildings of a brass mill will be erected shortly. The Chase company acquired the U. T. Hungerford Brass & Copper Co. in 1927 and the Ohio Brass & Copper Co. a few months ago. New warehouses have been added from time to time and new Cleveland mill will be located to serve them more promptly with manufactured products.

To Vote Simplification for Welded Chain

A general conference of manufacturers, distributors and users of welded chain will be held at the Department of Commerce, Washington, Nov. 15, under the auspices of the Division of Simplified Practice, Bureau of Standards. Manufacturers representing a large percentage of production have formulated a program calling for a reduction of about one-third in the number of sizes and varieties now catalogued. The conference will be held to act upon the proposals and to adopt a simplified practice recommendation. R. L. Lockwood, of the Division of Simplified Practice, will represent the Department of Commerce.

Railroad Bearing Bronzes Studied by Standards

To simplify specifications for railroad bearing bronzes and to study the properties of those bearing bronzes, an investigation was undertaken at the Bureau of Standards of the wear and mechanical properties of the bronzes at various temperatures. Results show that no one of the selected laboratory tests, consisting of wear, tension, impact and pounding, can be expected to yield information that is adequate for general comparisons.

The bronzes tested fall into certain general classes as regards wearing and mechanical properties, and each group shows superiority for certain types of service. As far as can be judged, existing specifications can be simplified. This simplification, it is urged, should include a reduction in the number of types with more generous limits in some cases in chemical compositions.

Aluminum Cartel Continued for Three Years

The European aluminum cartel, formed in 1926 for a two-year period, has been prolonged for three years, implying endorsement of the organization and its advantages in price-fixing and production allocation, according to a report received by the Department of Commerce from W. T. Daugherty, trade commissioner at Berlin. The production, in metric tons, of member countries in 1927 and 1926 respectively is reported as follows: Germany, 27,400 and 29,600; Switzerland, 21,000 and 22,000; France, 25,000 and 24,000; Norway, 22,000 and 24,400; Great Britain, 7900 and 7300; Italy, 2000 and none.

Canadian Tariff Plea Is Modified

The Algoma Steel Corporation, Sault Ste. Marie, Ont., has amended and somewhat modified its application for tariff protection. It now asks on flat spring steel a preferential tariff of 10 per cent, and for intermediate and general tariffs, 17½ per cent. On structural steel, the duty per ton suggested is \$2 preferential, \$2.75 intermediate and \$3 general tariff; on pig iron, \$1.50 preferential, \$2.50 intermediate and \$2.50 general; on billets, blooms and slabs, the proposed tariff is \$3 preferential, \$4 intermediate and \$5 general. New items proposed for protection are iron in pigs and iron kentledge; the company seeks a \$2 preferential rate and \$3.50 per ton intermediate and general tariff on these.

Canadian Plate Mill to Be Operated

The Dominion Foundries & Steel, Hamilton, Ont., has announced that it will soon start up its large plate mill which was erected in the closing months of the war at a cost of \$1,000,000 but never operated. The mill has been completely renovated, and preparations for production on a large scale are nearly completed. The company plans to make the first delivery of plate on Nov. 15. The mill is one of the latest high-speed type. It is the only universal plate mill in Canada and is designed to roll also sheared plate and carbon or alloy blooms for re-rolling. Canadian users of steel spent \$5,000,000 in the United States for plates in the last fiscal year.

The Fort Pitt Spring & Mfg. Co., McKees Rocks, Pa., has been sold to interests headed by Ralph H. Tate, Pittsburgh, Henry S. Sherman, Cleveland, and C. H. Collins, New York. The name will be changed to Fort Pitt Spring Co. The new owners take over the plant Nov. 1, and William McBride, president, will retire on that date.

Metals Lead in New England Manufacture

Government Survey Shows That Such Lines Overshadowed Textiles in Values Added by Fabrication

INDUSTRIES in which metals are the principal material were of more significance to New England in 1925, as a source of income, than all the textile manufactures. The metals industries, including the various kinds of machinery, iron and steel, transportation equipment, nonferrous metals and jewelry, overshadowed textiles by \$138,353,000 in the value added by manufacture, and made up 31.9 per cent of the New England total. Omitting transportation equipment the difference is reduced to \$58,000,000.

This little recognized fact is pointed out in a survey of the New England marketing area which has just been completed and published by the Department of Commerce under the title of "New England Manufactures in the Nation's Commerce." The survey was initiated by and conducted with the cooperation of the New England Council.

The number of establishments in the metal and related industries is given as 3662, constituting 20.2 per cent of the total of the 18,173 New England establishments listed and exceeding any other line of industries. The cost of materials used by the metals industries was \$676,365,000, or 21 per cent of the total for New England. The value of products was \$1,613,126,000, or 26.2 per cent of the total, while the value added by manufacture was \$936,761,000, compared with \$798,408,000 added by manufacture in the textile industry whose cost of materials was \$1,212,488,000, or 37.6 per cent of the total. The value of textile products, which like the cost of the industry's materials, led all other values, was \$2,010,896,000, or 32.6 per cent of the total. The number of establishments in the textile industries was 2579.

Wage earners in the metals industries totaled 317,025 or 28.2 per cent of the total, while the payroll was \$427,183,000, or 31.9 per cent of the total. Wage earners in the textile industry exceeded those of any other industries, as did their aggregate income. The number was 412,544, or 36.8 per cent of the total, and the payroll amounted to \$435,736,000 or 32.5 per cent of the total.

Values Added by Manufacture in Metals Greater Than in Textiles

The figures on cost of materials disclose a conspicuous contrast between the metal industries and the textile group and bring out strikingly the difference in the expenditures for materials for fabricating the product in these two major groups. The total for metals was only slightly more than half the cost of the materials for the textile industries, yet the metals industries contributed considerably more to the New England in-

come from manufacturing than did the textiles. The value added by manufacture in the metal industries was considerably greater than its cost of materials, the latter representing about 42 per cent of the total product, while the value added in the process of manufacture was 58 per cent. With textiles the condition was reversed, the cost of materials being much greater than the value added by manufacture. Materials comprised about 60 per cent of the total value of the product, while the process of manufacture contributed only 40 per cent.

Director Julius Klein of the Bureau of Foreign and Domestic Commerce said that vigorous and intelligent application of greater precision and more scientific planning in business management will yield better profits for the producer, higher wages for the worker and an improved product for the consumer at a lower cost. Dr. Klein referred to what was termed the

Iron and Steel Meeting at Chicago

A national iron and steel meeting is to be held at the Palmer House, Chicago, Nov. 14 and 15, under the auspices of the Iron and Steel Division of the American Society of Mechanical Engineers, George T. Snyder, chief engineer National Tube Co. at Lorain, Ohio, chairman. The program, which includes visits to several plants of the Chicago district, covers in part the following papers:

"Heat Economy Progress in Steel Mills," by F. H. Willcox, vice-president, and Gordon Fox, electrical engineer, Freyn Engineering Co., Chicago.

"Sheet Rolling," by Leon Cammen, consulting engineer, New York.

"Powdered Coal Cupolas," by D. H. Meloche, executive officer, American Radiator Co., New York.

"Hot Blast Cupola," by F. K. Vial, vice-president and chief engineer, Griffin Wheel Co., Chicago.

"Manufacture of Nickel Steel Plate," by Charles McKnight, development and research department, International Nickel Co., New York.

"Non-Ferrous Bearing Metals," by L. E. Christopher, Buckeye Brass & Mfg. Co., Cleveland.

"Lubrication of Steel Mill Equipment," by L. P. Tyler Vacuum Oil Co., Pittsburgh.

There will be a banquet on Wednesday evening, Nov. 14. The speakers announced at this writing are Prof. W. Trinks, Carnegie Institute of Technology, Pittsburgh, who will speak to "Some Observations on European and American Steel Plants," and H. V. Coes, Ford, Bacon & Davis, consulting engineers, New York, whose topic is "Taking Care of Depreciation and Obsolescence." The presiding officers

staggering losses in the nation's business from inefficient distribution, a figure estimated at approximately \$8,000,000,000 annually, representing about 20 per cent of the net value of the total manufacturing production of the United States.

The declared purpose of the New England and other marketing studies being carried on by the department is to develop, for the first time, the vitally important basic facts with which the business community, with the aid of the Government, can eliminate some of this enormous and unnecessary waste.

The income of the people of New England from manufacturing activity in 1925 was approximately 11 per cent of the total national income from this source, the total value contributed by all its manufacturing processes, outside of the cost of materials, having been \$2,936,153,000. This net income is to be distinguished from the gross value of all products of New England manufacture, including the cost of materials, the value of products having been \$6,161,009,000, and comprised 9.8 per cent of the gross value for the entire United States.

for the three technical sessions are: John W. Shepherdson, chief engineer Morgan Construction Co., Worcester; J. Fred Mowat, chief engineer Joliet Works, Illinois Steel Co., Joliet, Ill., and A. J. Boynton, vice-president H. A. Brassert & Co., consulting engineers, Chicago.

To Direct the Institute of Weights and Measures

Nominations as follows have been made to fill eight vacancies on the council of the American Institute of Weights and Measures, 115 Broadway, New York, to serve until December, 1931:

C. R. Burt, vice-president, Pratt & Whitney Co., Hartford.

W. D. Faucette, American Railway Association and chief engineer, Seaboard Air Line Railway Co.

Fred A. Geier, president, Cincinnati Milling Machine Co.

Edwin M. Herr, president, Westinghouse Electric & Mfg. Co. and past president, American Manufacturers Export Association.

W. R. Ingalls, consulting mining engineer and past president, Mining and Metallurgical Society of America.

Henry M. Leland, past president, Society of Automotive Engineers.

Henry D. Sharpe, treasurer, Brown & Sharpe Mfg. Co.

H. Nelson Street, secretary, Retail Dry Goods Association of New York.

Twenty more cities within the past few weeks have announced their intention of establishing municipal airports, according to the Aeronautics Branch of the Department of Commerce.

Mechanical Engineers to Hold Large Meeting

WITH more than 25 technical sessions covering all departments of mechanical engineering, the annual meeting of the American Society of Mechanical Engineers, which will be held at the Engineering Societies Building, New York, Dec. 3-7, will be of wide scope. The program is well balanced, with a wealth of timely material for both the plant executive and the designing engineer.

Machine shop practice will have a prominent place. A session will be devoted to presentation and discussion of a paper on the "Principles of Jig and Fixture Practice," by Prof. J. W. Roe, and there will be a symposium on methods of motor application and control. At the latter, four papers, devoted to motor application and control on lathes, planers, precision grinders and special drilling and tapping machinery, respectively, will be discussed. The third session, on finishes in the machine shop, will have a paper on "Carbide and Tungsten Carbide Tools," by S. L. Hoyt, and another on "Mechanical Application of Chromium Plating," by W. Blum.

"Cooling and Lubrication of Cutting Tools," a report of the subcommittee of the A.S.M.E. special committee on cutting metals, will be one of three papers at a session on lubrication.

The progress report of the materials handling division of the society will be a feature of the first session under the auspices of that division. A second meeting, with six prepared papers, will be devoted to skid handling of interplant shipment.

Two management sessions will be held jointly with the American Management Association. "A Basis for Evaluating Manufacturing Operation," a paper by L. P. Alford and J. E. Hannum, will be a feature of one of these meetings, papers at the other being: "The Executive Function in Industry," by R. T. Kent; "Management Engineering in the Smaller Plant," by J. E. Dykstra; and "Outstanding Economic and Technical Factors Involved in Engineering of New Manufacturing Equipment," by J. R. Shea.

A paper on "Preliminary Findings of a Study of Intensive Types of Technical Education" will be presented by R. H. Spahr at a session devoted to education and training for the industries of non-college type.

Proper illumination will be discussed at a joint meeting of the A.S.M.E. and the Illuminating Engineering Society. Papers include: "Light as a Factor in Production," by C. C. Monroe and H. A. Cook; "Designing Buildings for Daylight," by H. H. Higbie and W. C. Randall; and "Artificial Lighting Provision in Building Design and Process Layout," by Ward Harrison.

An iron and steel session has been arranged by the iron and steel division of the society. In addition to a progress report of the work of the divi-

sion, a paper on "Heavy-Duty Anti-Friction Bearings," by S. G. Koon, will be discussed. "Effect of Alloying Elements Upon the Stability of Steel at Elevated Temperatures," by A. E. White and C. L. Clark, will be a feature of a meeting devoted to industrial power.

Two sessions will be held by the applied mechanics, hydraulic and railroad divisions, respectively. Other meetings will be devoted to mechanical springs, aeronautics, oil and gas power, fuels, central station power, boiler feed water studies, fluid meters, printing industries and wood industries. There will also be a joint meeting with the American Society of Refrigerating Engineers.

The business meeting, followed by open house, will be held on Monday evening, Dec. 3. The presidential reception and dance will be on Tuesday evening and the annual dinner, at the Hotel Astor, on the evening of Dec. 5. College reunions are scheduled for Thursday evening.

Automotive Production Meeting in Detroit

AN unusually full program has been arranged for the production meeting of the Society of Automotive Engineers, which will be held at the Book-Cadillac Hotel, Nov. 22 and 23. Thirteen papers and seven committee reports will be presented at five technical sessions. There will also be two luncheon conferences, devoted to the selection and utilizing of machine tools and maintenance, respectively, and a production dinner meeting of the Detroit section of the S.A.E.

Papers at the first session include: "How the Ford Motor Co. Gets Its Phenomenally Low Production Costs," by John Younger, Ohio State Uni-

versity; "Production from the Accounting Point of View," by L. A. Baron, Stutz Motor Car Corporation of America, and "The Relation of Time Study to Manufacturing," by L. W. Haskell, Dodge Brothers, Inc.

"The Barnes Gear Shaver Process," by H. D. Tanner, Pratt & Whitney Co.; "Integral Contact Gearing," by A. B. Cox; and "Honing Progress," by C. G. Williams, Barnes Drill Co., are among the papers planned for the second session. At the production dinner, to be held on the evening of Nov. 22, addresses will be made by K. T. Keller, vice-president in charge of manufacturing Chrysler Corporation, and E. P. Blanchard, Bullard Machine Tool Co.

Materials handling will be discussed at the opening meeting of the second day, Nov. 23. Papers include: "Assembly Plant Layout for Material Handling," by N. H. Preble, Mechanical Handling Systems, Inc.; "Selection of Conveyor Power Units," by C. E. Broome, Gears & Forgings, Inc.; and "Possibilities and Limitations of Conveyor Chain Curvature," by J. B. Webb, J. B. Webb Co.

"Power Transmission Engineering as Affecting Production and Cost," a paper by W. W. Nichols, D. P. Brown Co., will be presented at the afternoon meeting, Nov. 23. There will also be prepared discussion relating to chain and other types of drive and savings obtained by proper belting. At the final session of the meeting, Paul Geyser, General Motors Truck Co., will speak on the "Development of Production Engineers and Executives."

Subcommittee reports on process and equipment, production expense, time study, production standards, inspection methods, materials handling and production meetings will be presented at the various technical sessions.

Coming Meetings

November

American Management Association. Nov. 12 to 16. Fall meeting, Palmer House, Chicago. W. J. Donald, 20 Vesey Street, New York, managing director.

American Institute of Steel Construction. Nov. 13 to 17. Sixth annual meeting, Biloxi, Miss. Charles F. Abbott, 285 Madison Avenue, New York, executive secretary.

American Society of Mechanical Engineers. Nov. 14 and 15. Iron and steel division, Chicago. Thomas Wilson, 7 South Dearborn Street, Chicago, chairman local section.

International Acetylene Association. Nov. 14 to 16. Annual meeting, Congress Hotel, Chicago. A. Cressy Morrison, 30 East Forty-second Street, New York, secretary.

Open-Hearth Committee, American Institute of Mining and Metallurgical Engineers. Nov. 15 and 16. Pittsburgh.

Second International Conference on Bituminous Coal. Nov. 19 to 24. Carnegie Institute of Technology, Pittsburgh.

Society of Automotive Engineers. Nov. 22 and 23. Production meeting. Book Cadillac Hotel, Detroit. C. F. Clarkson, 29 West Thirty-ninth Street, New York, general manager.

December

American Society of Mechanical Engineers. Week of Dec. 3. Annual meeting, 29 West Thirty-ninth Street, New York. Calvin W. Rice, 29 West Thirty-ninth Street, New York, secretary.

National Exposition of Power and Mechanical Engineering. Week of Dec. 3. Seventh annual meeting, Grand Central Palace, New York. Charles F. Roth, Grand Central Palace, New York, manager.

German Steel Lockout Affects Market

Nearly Quarter-Million Men Out of Work—British Markets Dull—French Advance Prices—Russian Output Gains

(By Cablegram)

LONDON, ENGLAND, Nov. 5.

CLEVELAND pig iron markets are quiet, but as the present limited output is going directly to local steel works, any increase in demand probably would necessitate restarting additional furnaces. Export inquiry is improving and some small sales have been made to Italy and Norway. Hematite is active and stocks are low, but demand as yet is insufficient to raise prices. Foreign ore is quiet.

Finished steel markets generally are dull, especially as regards heavy material for shipbuilding. Clyde output in October represented 13 vessels launched, aggregating 70,000 tons gross register. New orders are in poor volume, hence the winter outlook is unfavorable.

The South Durham Steel & Iron Co., Ltd., Stockton-on-Tees, is amalgamating with the Cargo Fleet Iron Co., Ltd., Middlesbrough, by exchange of shares. The arrangement contemplates purchase of the Cargo Fleet company by the South Durham company, which will increase its capital obligations by issuing 600,000 new £1 shares, for the purpose. The combined assets of the two companies are about £5,000,000.

Tin plate is quiet and some makers are starting to work off immediately the restriction period agreed upon some time ago, shutting down their works for some weeks. Consumers

are buying only limited quantities, but it is believed that a revival of interest may develop, if the strength of the tin market is maintained.

Galvanized sheets are inactive, but prices are firm, on well filled order books. Black sheets, in general, are quiet.

On the Continent of Europe

Continental markets are under the influence of the German labor crisis. Already more than 210,000 men in northwestern Germany are locked out.

In consequence, business generally is suspended and prices are advancing.

French production in September was 821,000 (metric) tons of pig iron and 759,000 tons of steel (ingots and castings). Belgian output was 325,000 tons of pig iron and 322,000 tons of steel. Fifty-six Belgian blast furnaces were active on Sept. 30. Luxemburg output in September was 231,000 tons of pig iron and 209,000 tons of steel. Saar output was 158,000 tons of pig iron and 162,000 tons of steel.

French Advance Semi-Finished Steels

Prices of Billets and Blooms Adjusted to Higher Level of Finished Products—Export Pig Iron Higher

PARIS, FRANCE, Oct. 22.—Domestic business continues quite active and, with the shortage of skilled workmen still acute, the introduction of some foreign labor is contemplated. French metallurgical coke has been advanced 5 fr. (20c.) per ton to 135 fr. (\$5.27), and prices of semi-finished material have been raised 25 fr. (98c.) per ton. The increased cost of raw materials to rolling mills is viewed with some pessimism by certain producers, which believe that too rapid an advance may prevent the revival expected in the business of mills that buy their supplies in the open market.

Pig Iron.—Domestic consumption of phosphoric foundry iron has been

smaller in October than had been expected, so that at the recent meeting of producers it was decided to forego the proposed increase in price of 10 fr. (40c.) per ton, which was to be charged on an additional 6000 tons made available for October delivery. The increase has been applied, however, to iron for delivery in November and December, for which months 38,000 tons each has been set aside for domestic consumers. At the latest meeting of hematite iron makers it was agreed that the price should be increased on all grades by 10 fr. (40c.) per ton, effective Oct. 18. The new quotations are 575 fr. (\$22.43) per ton, f.o.b. Lille, for foundry grade

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works with American equivalent figured at \$4.86 per £ as follows:

Durham coke, del'd.....	£0 17¾s.		\$4.31
Bilbao Rubio ore*.....	1 2	to £1 2½s.	5.35 to \$5.48
Cleveland No. 1 foundry..	3 8½	to 3 9½	16.64 to 16.89
Cleveland No. 3 foundry..	3 6		16.04
Cleveland No. 4 foundry..	3 5		15.80

(a) Nominal.

and 530 fr. (\$20.67) per ton, f.o.b. Lille, for forge. The Bordeaux prices of these grades are 610 fr. (\$23.79) for foundry and 590 fr. (\$23) for forge. The entente of French, Belgian and Luxemburg producers, at its recent meeting, agreed to advance export prices on phosphoric foundry iron as follows: F.o.b. Basle, Switzerland, ex-duty, advanced from £3 19s. 3d. (\$19.26) per ton to £4 2s. (\$19.93) per ton; f.o.b. Thionville, for Italy, advanced from £3 0s. 6d. (\$14.70) to £3 2s. 6d. (\$15.18); f.o.b. Antwerp, for all overseas shipment, advanced from £3 5s. 6d. (\$15.92) per ton to £3 8s. (\$16.82) per ton. The price f.o.b. Antwerp for Great Britain is unchanged at £3 5s. 6d. (\$15.92), and the price f.o.b. Dutch frontier is unchanged at £3 7s. (\$16.04) per ton. The entente was renewed for another year.

Semi-Finished Material.—To adjust bloom and billet prices in the domestic market to the higher levels of finished products, an increase of 25 fr. (98c.)

per ton has been made, the first since May 15. The new prices are 560 fr. (\$21.84) per ton for blooms and 590 fr. (\$23) per ton for billets. Sheet bars are unchanged at 600 fr. (\$23.40) per ton. Demand for open-hearth material is heavy despite recent advances in prices of from 120 to 180 fr. (\$4.68 to \$7.02) per ton by most mills. One producer in the northeast is asking an advance of only 100 fr. (\$3.90) per ton on open-hearth grade.

Finished Material.—The sheet market continues quiet and prices are unchanged. Mills, however, are well booked with tonnage, and delays in delivery on medium-gage sheets range from three weeks to three months. Plate prices vary from 780 to 800 fr. per ton (1.38c. to 1.41c. per lb.), depending upon the location of the mill. There is an active demand for hoops, but the capacity is large and deliveries are good. The base price for hoops is 800 fr. per ton (1.41c. per lb.), but some mills are granting rebates for desirable business.

sales has increased from 32 per cent to 50 per cent of all sales, and as export business is at considerably lower than domestic prices, the mills have actually lost money, it is said.

These figures are in dispute. Should the decision of the arbitration court be rejected by either party, the Ministry of Industry has authority under a law of 1923 to declare the decision in force, thereby precluding a strike or a lockout.

German Lockout Affects Four-fifths of the Industry

(By Radiogram)

BERLIN, GERMANY, Nov. 5.

LOCKOUT of iron and steel employees, which began Nov. 1, continues, with 220,000 workers locked out. Works producing 80 per cent of all the German iron and steel output are closed down. The Steelworks Syndicate has refused to book any more domestic or foreign orders.

Stocks in producers' and traders' hands are sufficient to meet domestic demand for a short time, but increased imports are expected from the Saar district and from France. Until the conflict has been terminated Germany must withdraw entirely from the international market, as a result of which western European prices for iron and steel products are reported to be rising.

Exports to Far East Still Small

NEW YORK, Nov. 5.—Export trade in steel products is still limited to orders for small lots and specialties. Chinese merchants are inquiring for small tonnages of plate cuttings and second-hand material, but the recent advance in the scrap market here has resulted in higher prices than they are willing to pay. Recently Chinese buyers have been inquiring for wire shorts and, finding this material difficult to obtain because of lack of interest among mills and exporters, have advanced their offering prices to \$50 per ton, c.i.f. Chinese port. Much of this lack of interest by sellers is said to be the result of continued claims made by the Chinese buyers on shipments of wire shorts and the low prices offered in China.

Japanese buying is being done largely from British and Continental mills. Welsh tin plate mills are reported seeking tonnage for the rest of this year, although they are well filled with orders for delivery in the first quarter of 1929. Recent quotations on tin plate by American mills have ranged from \$5.15 to \$5.20 per base box, c.i.f. Japanese port. Sheet prices are unchanged at \$76 per ton, c.i.f. Japan, which is too high to permit business, as the Japanese domestic market set by the quotations of the Kawasaki Dockyard Co., Kobe, the leading domestic maker, is \$72.50 per ton.

Russia Near Pre-War Steel Output

Pig Iron Production Still Lags—Steel Shortage Foreseen With Large Machinery Building Program

MOSCOW, RUSSIA, Oct. 20.—Production of iron and steel in the Government business year, which ended Sept. 30, was close to the pre-war output in steel and rolled products, but considerably smaller than the production of 1913 in pig iron. Output of pig iron for the year 1927-1928 was 3,282,000 metric tons, compared with 4,207,000 metric tons in 1913. Production represented 96 per cent of the program for the business year just closed. Steel ingot production exceeded the year's program by 4 per cent, reaching 4,143,000 metric tons, compared with a pre-war output of 4,247,000 tons. Production of rolling mill products was 3,286,000 metric tons, compared with 3,509,000 tons in 1913.

The program for pig iron, output in the year 1928-1929 calls for 3,884,000 metric tons, which is 602,000 tons more than this year's production and 323,000 tons less than the pre-war output. Serious shortage of iron, steel and rolled products is predicted in official circles for the new year. While the production program of iron and steel has been increased by about 12 per cent, the output of general machinery is to be increased 24 per cent, agricultural machinery 28 per cent, and shipbuilding 33 per cent. It is expected that the Government railroads will receive only 87 per cent of their requirements. There is a decided shortage in supplies of bar iron, structural material and sheets for roofing.

To remedy this scarcity of iron and steel, the Council of Economy has called for a census of all available iron and steel scrap in the country, and the holders of this material are to be required to make sales to the Ore and Metal Board. It is expected that

about 900,000 tons of scrap will have been delivered to the board by October, 1929.

Of 1,979,000,000 rubles to be invested by the Government in industrial construction and extensions to existing plants, the heavy iron and steel industry is to receive 248,000,000 rubles, compared with 201,000,000 rubles in the past year. The Council of Economy has ordered more rapid construction of the Telbesse Smelting Works in Siberia, which will cost, together with another large plant at Magnitogorsk, about 300,000,000 rubles. The Telbesse works is in a coal region, and local ore will be sufficient for 20 years on the basis of an annual pig iron output of 640,000 tons. Official consideration is being given to the establishment of a bridge building corporation to be known as the Moststroï.

German Wage Dispute Is Before Arbitration Court

BERLIN, GERMANY, Oct. 23.—The wage dispute in the Rhenish-Westphalian steel industry has been brought before an arbitration court. Meanwhile the employees continue to demand a wage increase of 15 pf. an hour, and the mills claim that the average profit from sales has not increased this year, so that no wage advance is justified.

According to the syndicate controlling semi-finished material, railroad and structural steel and reports of the Bar Iron Syndicate, the average return has been 3.17 per cent lower than in October, 1927. Although prices have been advanced, the proportion of direct and indirect export

This Issue in Brief

Business peak will be reached in 1929, forecaster declares. After reaching the peak, business will decline until some time in 1930, depending on how long commercial money rates continue their present upward general trend, Simonds forecasting line indicates.—Page 1153.

* * *

Correct heat treatment of rust-resisting steels is very important, says Dr. Hatfield. Incorrect heat treatment may destroy homogeneity, with consequent setting up of electrolytic corrosion.—Page 1165.

* * *

Proportion of arc welds and acetylene welds has decreased during past 14 years in automobile welded body construction, while spot and flash welds have increased. Reduction in arc welds is due to change in methods.—Page 1154.

* * *

Doubles turnover of plating department by mechanical handling. All material to be plated in cash register plant is conveyed to a central overhead receiving station in charge of one man, who routes it by gravity conveyors to various stations. The same central overhead station receives plated parts and routes them by conveyors to departments performing the next operations.—Page 1152.

* * *

For localized carbonizing and hardening, the most convenient and least expensive method is to copper-plate parts in bulk. Then parts are machined at the places where they are to be hardened. The copper-plating protects the surfaces which are not to be hardened.—Page 1153.

* * *

Aircraft builders will use one million dollars' worth of steel in 1929, according to estimate. Though estimated quantity (4650 tons) is not large, its value is relatively high, as alloy steel is used almost exclusively.—Page 1161.

Do not depend entirely on laboratory tests when using rust-resisting steels, warns British metallurgist. Make frequent shop tests, because in manufacturing processes it is rare that pure substances are used, and small amounts of impurities may make a big difference in corrosion resistance.—Page 1165.

* * *

Barrel-plating superior to still tank-plating, for copper-plating parts to be carbonized and hardened at certain points, cash register manufacturer finds. Attributes this to the dense, compact plate obtained by the burnishing effect of the parts rolling over each other in the barrel.—Page 1153.

* * *

Portable spot welder cuts cost of welding difficult assemblies. Where it was formerly necessary to jig the sub-units with many loose toggle clamps, portable spot welders are now used to fasten the parts into one rigid assembly and the piece is removed for final welding.—Page 1155.

* * *

Speeds up production of special bolts by mounting three dies on header of drop-in die-forging machine. Thus three operations can be done in one heat. Dies are mounted one above the other. Grooves in side of frame in front of header are opposite the dies. Operator pushes heated bar against the header and, as the header goes back for second stroke, he drops his rod to second position and thence to third.—Page 1157.

* * *

Cadmium-plating in cash register plant is wholly automatic. Parts are loaded on metal racks covered with rubber, and carried by plating conveyor through nine operations, returning to the loading station.—Page 1152.

Corrosion resistance of ordinary commercial steel can be much increased, says Dr. Hatfield, by making it free from oxides and gas holes. He suggests that rust is a protective film, and that progressive oxidation may result from puncturing and local destruction of the film through various causes, such as the presence of foreign matter, leading to local electrolytic effects.—Page 1165.

* * *

Spot welding accomplished without surface markings. In automobile body plant, lower welding die is insulated and carries away no current. The current flows out through terminal clamped to inner frame of automobile door.—Page 1155.

* * *

Strength at elevated temperatures, without impaired resistance to scaling, is found in nickel-chromium steels to which tungsten or silicon has been added, says Dr. Hatfield. Ordinary steels lose a substantial proportion of their strength when they attain temperatures in excess of black heat.—Page 1165.

* * *

October daily pig iron production averaged 6.6 per cent over September. Output of 108,832 tons a day during October was highest daily rate since May, 1927.—Page 1182.

* * *

Solves problem of diverting blooms promptly to any of four destinations, without obstructing production stream. Chain transfer table in new Timken tube mill is located at right angles to shear runout table, so that all blooms can be handled, regardless of their ultimate destination. One operator controls not only the transfer table, but also the two runout tables connected with it.—Page 1166.

ESTABLISHED 1855

A Stock Market Appraisal

ON other occasions this year we have referred optimistically to the boiling stock market and have rejected bearish prophecy, discerning much that was explanatory of the general rise. We must admit, however, that as things keep on we find much that is increasingly difficult to understand, and not a few other observers are now expressing themselves to the same effect.

The last two years have seen an immense writing up of the market value of the aggregate of corporate stocks listed on the New York Stock Exchange, and the same is true of the listings on all other exchanges. Meanwhile neither earnings nor dividend distributions of these corporations have increased commensurately. Broadly, this indicates that investors have become satisfied with a smaller return. After all, if the transportation industry, the steel industry and other great industries yield only 5 per cent on the investments in them, why should any one be allowed to do more? If indeed any one is doing better there will be a rush to participate in it and it, too, will be brought down to the economic level.

Look down the list of the securities of the New York Stock Exchange, however, and it will be rare that anything sound yields as much as 6 per cent, and it is uncommon to find 5 per cent. On the contrary, most figurings will come to 4 per cent, 3 per cent, 2 per cent or nothing at all. This obviously implies the belief that earnings are already in excess of dividends or that they are going to be; in other words, that sooner or later dividends will be increased to a rate of 5 or 6 per cent. This naturally raises the question whether earnings are always what they are supposed to be.

There are some industries in which well managed companies are doing new things wherein the estimates and expectations are well founded, without any doubt. On the other hand are some industries wherein the forecasting and discounting are severely straining the imagination. Investors in them may come out all right eventually; but they may have to wait a long time, and at the end of 10 years they may figure that they would have done better had they lent their money at 5 per cent. Speculative pools, taking advantage of the popular psychology of the day, have boosted some stocks far beyond their value upon any basis of reckoning, even with the exercise of the imagination of a Colonel Sellers.

Plainly, the speculative buyers of a good many stocks, as was the case with buyers of Florida lots, are going to see their high-priced acquisitions shrink, for there is a top for everything. The time is bound to come when there are more sellers than buyers and

many will learn that they have overstayed their market; for the pools that are voluble in their recommendations to purchase are going to be silent in respect to any advice about selling. Our own advice to everybody in this juncture is not to gamble, neither for bull account nor for bear. The speculative investor who buys on the basis of a 5 to 6 per cent dividend yield, already in realization or in early prospect, convinced by good knowledge of industrial conditions and special corporate affairs, is warranted in doing so, but not even such a one should be a borrower of money for the purpose.

Progress in Steel Merchandising

WHEN the calendar year's financial results in steel manufacture come to be counted up a fair amount of progress will be shown in the direction of getting prices commensurate with production costs. It is just a year now since a fresh spirit spread over the steel producing trade in this matter and it is a fitting time to cast up the results.

Shipments of bars, shapes, plates and wire are at substantially better prices than one year ago. Sheets and strips on the whole are not. One might think that this is a chance alinement, but perhaps it is not. The products in the first group are all old and well established. There is only occasional chance for any cost reduction, even a small one. Sheet production is not nearly so old and strips are quite a new commodity. Producers of both seem to have reduced their costs by no negligible amount in a year's time. However, some of the bare returns may be misleading, since there has been a large increase in production, and mills in both lines feel amply justified in seeking higher prices for the first quarter of the new year.

Though it appears from the bare figures of prices that not a great deal has been accomplished this year, it must be considered that for about four years the general trend of steel prices had been downward. Of course it was absolutely essential to arrest that decline, but just the same it was a definite achievement to do so.

On account of a large increase in tonnage there were much better earnings in the first quarter of this year than in the last quarter of the old year and not much significance, as to realized prices, attached to the returns. From the first to the second quarter there was practically no change in the tonnage of steel shipped from mills, and there was a substantial increase in total earnings. That was to be ascribed almost wholly to higher realized prices. These third quarter reports do not show a corresponding increase in earnings. One large independent showed a decrease from second quarter. Another showed a very small gain compared

with that of its second quarter. The need of still more careful merchandising is indicated.

The steel industry has accomplished more than it fully realizes in the direction of holding its prices to a relation with total cost, for with the great increase in mechanization the overhead is a much larger proportion of total cost than formerly. There was a time when the bare out-of-pocket cost was the chief consideration. That conception has been formally abandoned but it would bob up if given a chance, and it is the duty of the seller to keep it entirely out of the conscious or unconscious mind.

The Germ of Future Prosperity

EVERYONE knows the intimate connection between advertising and present-day journalism. The relationship between advertising revenue and the success of a publication is so close that some people find it difficult to realize that the editor's first duty is toward his reading patrons, his "circulation." This fact does not prevent the editor as a publicist from appreciating clearly the value of consistent advertising. Quite the opposite, for of course what the advertiser buys from the publisher is an opportunity to tell his story to a carefully selected audience. That audience the editor must maintain. It is therefore no accident that various preachments have appeared in these pages upholding the proposition that publicity pays, even should the whole steel industry engage in it.

In this connection a very definite problem must be met by a small unit of such an industry, making, let us say, a group of special steels, making them well, and getting a fair proportion of the business. No great amount of money is available for sales promotion. A part is to be used for publicity and advertising—a little, certainly not enough to run a campaign in a popular weekly of general circulation; not much more than enough to get good space in one or two of the trade journals. How best to disburse this modest appropriation is indeed a problem.

Strong arguments will be advanced by the proponents of "direct mail" advertising that here is a clear job for them. The advertiser's output is specialized; the market is limited and fairly well known. "Put your own story to your own customers personally through the mails; do not get lost among a hundred other advertising pages," they may advise. But the fly in the ointment is this: Many other direct-by-mail advertisers are also competing for the attention of the prospective purchaser; so much material comes to each business man or householder that only a fraction of it is read, even opened, before it goes to the waste basket.

Consideration of the mass of direct-by-mail advertising and numerous "house organs" indicates that at least four elements are necessary for success; and the combination is so difficult that it is no wonder there are dozens of failures for every successful effort:

1. Adequate resources of information and illustration.
2. Consistent editorial direction.
3. Outstanding quality in the printed matter.
4. An excellent mailing list.

Even though men and materials for the first three may be available (and they are not cheap), lack of the last essential will be their undoing.

Of course, a mailing list can start with the present

and past customers of the firm. But if the ledger is the sole source of names, the advertiser is hedged in a small and diminishing area. Old customers drift away, consolidate, go out of business. Where can they be replaced?

Here, it seems, is the first aid the technical press can give to even the closest adherent of direct-by-mail advertising. How else but by advertising in the trade press can such a manufacturer of basic supplies or equipment as we are visualizing get his story so cheaply or so effectively before the new men who are continually entering the field? How better can he impress these newcomers with the progressiveness, the responsibility and the reliability of his firm than by consistent and attractive advertising? Originally, as prospective customers, their purchasing power is doubtless small; nevertheless the little fellows of today are the big boys of tomorrow. If a vendor can establish cordial relations with a small business, he has the inside track to the real sales later on. Even though a specialty of specialties is being handled, and interest maintained adequately by direct mail, the trade press is and always will be necessary to reach the great outside unknown market which holds the germ of future prosperity.

Making Competition Fair

WHEN the Sherman law was passed it was the common idea that the head and front of possible offending by business was such restraint of trade as resulted in extortionate prices. Latterly much more emphasis is put on forms of unfair competition that demoralize relations between competitors and thus cripple industry and trade. No tendency is so marked in business today as the giving way of individualism to group action. The cooperative spirit is taking hold of business men and is making them willing to subordinate individual advantage to the interest of the group. As it is put by Charles F. Abbott elsewhere in this issue, he who resorts to unfair competitive methods "scuttles the ship in which he himself is afloat."

The latter-day movement to regulate competition does not aim to fix prices but rather to get rid of unethical practices. Some of these latter are listed by Mr. Abbott. It is felt that, when the views of a given industrial group on practices that should be banned are crystallized in a code, competition can be lifted to a higher plane. Professional ethics have long been a powerful influence in medicine, though obviously unenforceable by law.

Competitive attacks are commonly defended on the ground of retaliation. Yet reprisals are often based on nothing more than distrust. Cooperation in adopting a selling code, it is argued, would do much to promote mutual confidence and dispel suspicion.

The Federal Trade Commission has cooperated with various industries in formulating codes of practice and has branded violations as "unfair methods of competition," presumably punishable by law. That the Trade Commission can do much in encouraging the adoption of codes is conceded, but it is an open question—still undecided by the courts—whether enforcement by law is possible or advisable. Unfair competition can manifest itself in such devious ways as to make its ferreting out in all the labyrinths of modern trade a stupendous

task. The most effective remedy lies in cultivating a spirit of self-respect and of loyalty in industrial and commercial groups rather than inviting further invasion of business by the Government.

Studying for Leisure

BOUT a fortnight ago two thousand admirers gathered to do honor to nine "Pioneers of American Industry." While some of the nine might be more properly thought of as organizers and executives than as "pioneers," no one would begrudge the wealth and honors heaped upon them for great achievements. This is the roll:

Cyrus H. K. Curtis, publishing.
Glenn H. Curtiss, aircraft.
George Eastman, photography.
Thomas A. Edison, invention.
Harvey S. Firestone, rubber.

Henry Ford, automobiles.
Julius Rosenwald, merchandising.
Charles M. Schwab, iron and steel.
Orville Wright, aviation.

One point is worth mentioning: Not a single one of them had a university education. Mr. Schwab wittily referred to this fact and sounded a warning. "Many graduates come from college with an education that exceeds their intelligence," he said.

Dr. Nicholas M. Butler, president of Columbia University, rejoined with the remark that such men as the honor guests were giving the human race so many mechanical aids that the problem of the near future would be to teach men and women how to use their leisure time to best advantage, rather than to prepare them for an "occupation." In other words, the swing of the pendulum brings us back to the earlier ideal of going to college to become a cultured citizen, rather than to learn a profession.

Selling Code Is Prime Need

Industries Must Set Up Standards to Check Unfair Competition—Remedy for Short-Sighted Selling Lies in Cooperation, Not Laws

BY CHARLES F. ABBOTT*

"The individual who refuses to cooperate with his competitors scuttles the ship in which he himself is afloat."—Charles F. Abbott.

WE are now face to face with the problem of distribution, of scientific marketing and selling. Most men will agree that, even with business activity at a high pitch, prices have been unsatisfactory, profits have been disappointing and competition has been more difficult to meet.

Short-sighted selfishness is the root of most selling troubles. Until it gives way to a spirit of justice and fairness and a sense of duty to one's industry, we cannot expect real relief. It is only through sincere cooperation and fair play that a way can be found to dissipate unenlightened competitive practices.

No cure for this malady can be obtained through any legal process; the only hope rests in spreading the spirit of fair dealing and industry-consciousness. To this end the best available plan is the setting up of ethical standards and then striving for their general adoption.

Moses gave the world the Ten Commandments, the first of all ethical codes. Murders are still being committed, but crime has been sharply reduced throughout civilized countries and most of the people everywhere are at least trying to live up to the code of living set forth in the decalogue.

Only Unskilled Amateurs Break the Rules to Win

In business many of our unfair practices are blamed on the buyer. But we must not forget that most of the unfair tactics used by the buyer were taught him by the over-anxious seller, who is now being confounded by tricks of his own creation.

Who can deny that it is unfair for a seller to submit a second and lower price when the order rightfully belongs

to a competitor? Or that it is improper for a manufacturer to solicit business from jobbers and then go directly to the jobbers' customers with prices as low or lower than those established for the jobbing trade?

The acceptance of a standard selling code is essential. Eventually this need will be recognized. Little men think themselves wise when they take an hour to figure out how they can beat out a competitor. Big men are continuously searching for ideas that will build up their business. Herbert Casson once stated that in business as in golf it is only the unskilled amateurs who have to break the rules to win; and in both golf and business they are soon found out.

Making Each Sale Stand on Its Own Bottom

In the past sales executives have devoted too much attention to volume instead of profits. Hard pressed to obtain business and keep it away from competitors, they have been driven into a state of volume-mindedness. Today, this attitude is being changed by the campaign to increase net profits now being pushed by far-sighted commercial executives.

Sales totals are being "broken down" to determine selling costs. By finding the percentage of selling expenses to the sales of each sales representative attention is being focused on the net profit from each sale. Sales organizations are becoming "profit conscious," and this calls for a radical change in personnel and policies. The day of the volume seeker is passing.

Production Must Be in Keeping with Demand

Industry must understand and accept the theory of stabilized production. It must recognize the folly of attempting 100 per cent output with a 50 per cent demand. It must recognize the spirit of live and let live and avoid prac-

*Executive director American Institute of Steel Construction, New York.

tices that invite reprisals and lead to price demoralization. It must add a profit to total cost in fixing selling prices. It must learn that a million times nothing is still nothing. Failure to adhere to a one-price policy invites price wars. The one-price policy is a basic fundamental of sound salesmanship. Without it, a selling program is at the mercy of the buyers.

Fair dealing calls for a price structure that is in keeping with a reasonable profit. If concessions are to be made, they should be based on cost reduction instead of cutting into the margin of profit.

Refusal to Cooperate Injures Entire Industry

The obvious advantages of doing business on a stable and equitable price basis accounts for the growing interest in a standard selling code. Such a code is still regarded as visionary by some, but certainly nothing is to be lost in cultivating the sense of fair play innate in every man and encouraging habits of cooperation. Few factors do more to retard the natural progress of a business or a movement than the lack of intelligent cooperation.

The individual who refuses to cooperate with his competitors, and who insists upon ruthless price cutting as a means of obtaining business, is worse than a criminal. He is a fool. He not only pulls down the standing of his company; he not only pulls down his competitors; he pulls down himself and his whole trade. He scuttles the ship in which he himself is afloat.

Codes of Selling Practice Now in Effect

Practical codes of selling practice have been prepared and adopted by many organizations with splendid results. Among those that have done so are the Better Business Bureau, the International Advertising Association, the National Association of Purchasing Agents, the American Society of Civil Engineers, the American Institute of Architects, the Chamber of Commerce of the United States and the National Association of Credit Men. Industries that are profiting by the use of codes of practice include the Associated General Contractors, the American Face Brick Association, the Electric Power Club, the National Slate Association, the American Electric Railway Association, the National American Wholesale Lumber Association, the Motion Picture Theater Owners of America and the National Retail Hardware Association.

There is a distinction between so-called codes of standard practice and those that deal exclusively with ethics. Some five years ago the American Institute of Steel Construction prepared and adopted a Code of Standard Practice. This code includes rules that control all contractual relations between the buyer and the seller. Written in a positive form, it clearly specifies just what each party may expect. Its use has eliminated the misunderstandings and controversies that previously existed. Many economies have followed its general acceptance and the public has benefited to a large extent.

Selling Practices That Are Harmful

Codes of selling practice deal with the ethics involved in sales relations between manufacturers, jobbers, retailers and consumers and between each other within these groups.

The jobbing industry extends an invaluable service to the public in being able to supply small orders promptly. Its overhead expenses and other items, added to the cost of its stock plus a reasonable profit, go to make up its sales prices. Unless the manufacturers are willing to recognize the value of this service, and refrain from quoting prices directly to the customer that fail to include the distributor's charges, then the warehouse industry cannot possibly continue. Its elimination would inflict a handicap upon the public in taking away a service that no producer is equipped to extend.

There are manufacturers who produce raw materials

that are sold to industries for fabrication into various products and resold by them to jobbers, retailers or consumers. If the original producer were to set up a fabricating plant of its own, supply the raw material at production costs and operate the plant as a means of increasing the output of the producing unit without regard to profits in the rehandling, and sell the output directly to jobbers, retailers or consumers at prices lower than the fabricating industry could possibly quote, then such a policy would naturally be held unfair and unethical. Dissatisfaction would follow, and conditions would force the intermediate industry to seek another source of supply.

An unethical practice that should be universally condemned is for a buyer to lead the seller to believe that his prices are high when he is actually the low bidder. It never pays to jeopardize an important source of supply and, unless all transactions can be concluded on a basis of reasonable profit, then substitutions follow with serious impairment in quality and service.

Commercial bribery is another unethical practice which dissipates sound salesmanship and stamps all parties addicted to it as irresponsible and dishonest.

Failure to apply a fixed price policy is an unethical practice. To submit a price as a "practice shot" with five or six lower ones held in reserve is an unfair policy. The buyer suffers from the lack of stabilized prices, while the seller loses if he makes successive price cuts when his first quotation may have been the lowest. A salesman without courage is like a ship without a rudder. He is continually being blown about in different directions by the winds of fear, doubt and uncertainty.

A manufacturer who depends on the jobber as his logical distributor engages in an unethical practice whenever he sells the financially irresponsible or those without equipment or recognition in the industry, and at prices as low or lower than those scheduled for the jobber.

The following subjects could well be covered in a code of selling practice:

1. A one-price policy.
2. Commercial bribery.
3. Attitude toward competitors.
4. Misrepresentation.
5. Secret rebates.
6. Unfairness of selling at or below cost.
7. Preferential allowances.
8. Price discrimination.
9. Arbitration.
10. An agreement to uphold the standards as established by the industry and avoid substitution or impairment of quality or workmanship.

How Federal Commission Can Aid in Enforcing Codes

The Federal Trade Commission is now prepared to supervise trade practice conferences whenever its assistance is solicited by a representative majority of the group interested. Forty of these conferences have already taken place and about 30 applications are pending.

The commission holds that a clandestine violation of a trade practice conference rule by one who has openly subscribed to that rule is an unfair method of competition within the meaning of the Federal Trade Act.

Industry is awakening to a realization that its competitive methods must be adjusted upon a basis that will permit fair profits. Failure to do so may invite Government regulation to protect the public, which eventually suffers when business exists on an unprofitable basis. Rancor, hatred and jealousy must give way to just relationships based upon codes of ethical practice.

Business men on the average are growing better. They are becoming more intelligent and better educated. This makes for legitimate advancement and prosperity. The secret of better business is to climb up from retaliation to reciprocity. Codes of selling practice will speed up that evolution.

October Iron Output Very Large

Daily Rate Gained 6755 Tons or 6.6 Per Cent Over September—

Largest October Since 1918—No Gain or Loss in Furnaces

ACTUAL data covering pig iron production for October correspond quite closely with the estimates published in THE IRON AGE, Nov. 1, and collected by wire on Oct. 30. The October daily rate was 108,832 gross tons per day; the estimated figure as published was 108,800 tons.

Total October coke pig iron output was 3,373,806 tons or 108,832 tons per day for the 31 days as against 3,062,314 tons or 102,077 tons per day for the 30 days in September. This is an increase for October of 6755 tons per day or 6.6 per cent. In September the increase was 0.88 per cent with the August increase 2.1 per cent. The October daily rate last year was 89,810 tons. The daily rate

last month was the largest in 17 months or since May, 1927, when it was 109,385 tons per day. The October rate this year is also the largest for that month since 1918; in fact there have been but two October daily rates exceeding that of this year—in 1918 and in 1916.

Operating Rate Active on Nov. 1

On Nov. 1 there were 197 furnaces active, having an estimated operating rate of 108,800 tons per day. This compares with 106,755 tons per day as the operating rate for the 197 furnaces active on Oct. 1, eleven furnaces having been blown in and 11 shut down during October. The higher operating rate for the same

number of furnaces is explained by the greater effort to increase output, usual in October.

Of the 11 furnaces blown in during October five were Steel Corporation stacks and six belonged to independent steel companies. There were four Steel Corporation furnaces and four independent steel company stacks shut down besides three merchant furnaces. Thus there was a net gain of three steel-making furnaces and a net loss of three merchant furnaces.

Steel and Merchant Iron

Steel-making iron last month was made at the rate of 88,051 tons per day, a gain of 5461 tons over the

*These totals do not include charcoal pig iron. The 1927 production of this iron was 164,569 tons.

Daily Pig Iron Output in October Was 6.6 Per Cent More Than in September; Composite Prices Substantially Unchanged
Inclined line represents the gradually increasing theoretical needs of the country, ascertained by a balancing of the ups and downs in production. It shows an average yearly increase in consumption of about 415,000 tons

82,590 tons per day in September. The daily rate for merchant iron also increased to 20,781 tons as against 19,487 tons—a gain of 1294 tons per day for October.

Furnaces Blown In and Out

During October the following furnaces were blown in: One Lackawanna stack of the Bethlehem Steel Co. in the Buffalo district; one Bethlehem stack of the Bethlehem Steel Co. in the Lehigh Valley; one Swede furnace of the Alan Wood Iron & Steel Co. in the Schuylkill Valley; one Eliza furnace of the Jones & Laughlin Steel Corporation and two Edgar Thomson, one Duquesne and one Carrie furnace of the Carnegie

Steel Co. in the Pittsburgh district; one Cambria stack of the Bethlehem Steel Co. in western Pennsylvania; one South Chicago furnace of the Illinois Steel Co. in the Chicago district, and one furnace of the Ford Motor Co. in Michigan.

The following furnaces were blown out or banked last month: One Swede furnace of the Alan Wood Iron & Steel Co. and the Keystone furnace of the Reading Iron Co. in the Schuylkill Valley; one Clairton stack of the Carnegie Steel Co. in the Pittsburgh district; one Cambria stack of the Bethlehem Steel Co. in western Pennsylvania; the Martins Ferry furnace of the Wheeling Steel Corporation in the Wheeling district; the furnace of

the Jackson Iron & Steel Co. in southern Ohio; one South Chicago stack of the Illinois Steel Co. and one Madeline furnace of the Inland Steel Co. in the Chicago district; one Bessemer and one Ensley furnace of the Tennessee Coal, Iron & Railroad Co. in Alabama, and the Rockdale furnace of the Tennessee Products Corporation in Tennessee.

Possibly Active Stacks Reduced

The two Warwick furnaces of the Warwick Iron & Steel Co., Pottstown, Pa., have been sold and will be dismantled. This reduces the number of possibly active stacks in the United States from 339 to 337.

Slight Reduction in Power Output

Production of electric power by public utility power plants in the United States in September is reported by the Geological Survey at 7270 millions of kwhr. This is a reduction of more than 3 per cent from the August total of 7505, but is nearly 2 per cent ahead of the July total of 7143. Less of the September power was produced by hydraulic plants, the reported amount being 2785, which is about 38 per cent of total power production. This compares with 3044 in August, about 40½ per cent; and with 3075 in July, about 43 per cent.

Iron and Steel Markets

Pig Iron Prices Still Rising

Fresh Advances at Chicago, Cleveland and St. Louis—

Rail Orders Total Nearly 300,000 Tons—

Scrap Down Again at Pittsburgh

WITH prices still swinging upward, the pig iron market shows vitality suggestive of boom conditions. The finished steel market is also strong, with an advance of \$2 to \$3 a ton on sheets an early probability, but mill backlogs continue to taper, following exceptionally heavy shipments in the past month.

Unfilled tonnage, however, has been reduced so little that production is not materially affected, and fresh demands springing up from the railroads and other sources are of promising size.

The one index that seems to point to a less active market situation is scrap. Heavy melting steel at Pittsburgh has declined 25c. a ton for the second time in two weeks, and at Philadelphia it has dropped 50c. a ton.

With the large shipments of finished steel in October, it will be surprising if ingot statistics for that month do not show an output at least equal to the tonnage for March, the previous high month of the year. November steel production points to a gradual recession, activity now ranging from 85 to 90 per cent. The average for Steel Corporation plants has declined to 85 per cent, partly because of the shutting down of the Gary rail mills, bringing the rate of the Chicago subsidiary down to 75 per cent.

That the setback in the Chicago district is only temporary is indicated by sales of the week, which were the highest so far this year and with one exception the largest in three years. Orders for 185,000 tons of rails formed an important part of the total. Rail bookings for the country exceeded 290,000 tons, of which the New York Central accounted for 191,550 tons—70 per cent for immediate specification and the remainder on option. Other orders included 48,000 tons placed by the St. Paul and 5000 tons purchased by the Monon.

Pending railroad equipment business, swelled by a Wabash inquiry for 2000 box cars, now calls for a total of nearly 10,000 cars, requiring 140,000 tons of steel. The Santa Fe is expected to enter the market for 6000 cars and the Illinois Central for 2500.

Demand for steel from the automobile industry has declined from its recent peak, but heavy buying is expected to set in again by Dec. 1. Meanwhile, Ford output has increased to 6000 cars a day, and the Chevrolet company has released steel specifications for 125,000 cars of its new model, on which production will start shortly.

Line pipe business, which has been an important tonnage item this year, promises to make further heavy drafts on the mills. Figures are being taken on a gas line from Louisiana to St. Louis, calling for 115,000

tons, and another from Louisiana to Birmingham, requiring 40,000 tons. Gas lines in prospect, but not definitely before the trade, include one for the Texas Corporation from Tulsa, Okla., to Lockport, Ill., involving 60,000 tons, and a 350-mile line for the Western Natural Gas Co. from Wyoming to Salt Lake City.

Shipbuilding continues to react to the stimulus of the Merchant Marine act. Bids have been opened in New York on four freight vessels, calling for 13,000 tons of steel, mainly plates.

Pig iron prices have advanced 50c. a ton at Chicago for the second time in two weeks, and equal increases have been registered at Cleveland and St. Louis. Prices for foundry and malleable pig iron at Cleveland are now \$2 to \$2.50 a ton higher than in midsummer.

Sales at Cleveland totaled 69,000 tons and at St. Louis, 45,000 tons, in large part for first quarter delivery. At Chicago, pig iron shipments in October were heavier than for any previous month in 1928, and shipments for the year are expected to set a new record.

Despite the pressing demand for pig iron, complete blast furnace returns for October show a loss of three active merchant stacks during the month. This was canceled by a net gain of three steel works furnaces, the total number of active stacks Nov. 1, at 197, being exactly the same as on Oct. 1. The average operating rate, however, increased from 106,755 tons on Oct. 1 to 108,800 tons a day on Nov. 1.

The tin plate price for 1929 will probably be announced between Nov. 15 and Nov. 20. If an advance is made it is not expected to exceed \$2 a ton.

The new base prices on hot-rolled strip, recently announced, do not govern cooperage stock, as was first supposed. The base on this product, as quoted by some makers, is 2.10c. per lb., Pittsburgh, or \$2 a ton above the base on narrow strips.

Cold-rolled strips are now definitely established at 2.85c. a lb., Pittsburgh or Cleveland, or \$2 a ton above the recent minimum price. Consumers covered liberally before the advance.

Several manufacturers of wire nails have adopted a plan under which jobbers will be given a differential of 10c. per 100 lb. under prices charged other classes of carload buyers.

The locking out of 220,000 steel workers in Germany on Nov. 1 has closed plants representing 80 per cent of the iron and steel capacity of that country.

Making the eighth advance in 11 weeks, from a low of \$17.04 in August, THE IRON AGE composite price for pig iron has reached \$18.34 a gross ton, compared with \$18.25 last week. The finished steel composite remains at 2.369c. for a second week.

Steel Backlogs Declining and Deliveries Are Less Extended —Pig Iron Makers Seek Still Higher Prices

PITTSBURGH, Nov. 5.—In point of mill engagement, the steel market is quite as active as it has been at any time recently, but the contraction in new commitments, which began in the second week of October, continues. With completed orders exceeding fresh bookings, backlogs are growing slimmer. Makers of sheets still profess inability to make shipments of the common finishes in less than two weeks without deferring deliveries on prior specifications, and the promise on full-finished sheets is four to five weeks. Strip makers are well obligated on probable production this month, but in bars and shapes makers have caught up with their orders to an extent that they now are promising reasonably prompt deliveries on new purchases.

The mills have at no time in the recent rush of business been seriously backward in deliveries of plates, wire products or tin plate, while the principal backlog business in pipe has been in that for oil and gas lines. A considerable tonnage of the latter is embraced in inquiries and projects now being discussed. One inquiry calls for 60,000 to 70,000 tons and two other projects nearing the inquiry stage will take fully 100,000 tons.

Rail orders for 1929 delivery are flowing steadily to the mills, and, with the election out of the way, it is be-

lieved that a large number of railroad cars and a goodly number of locomotives will come up for bids.

Taken as a whole, less steel is moving to the motor car builders than was true recently, and structural steel lettings to local fabricators remain very small. October was such a good month in shipments of finished steel products that it will occasion surprise if steel ingot production figures, when announced, do not show that October equaled the previous high record for the year in April. Given an order book such as the industry started with

last month, plus the urgency of shipments there was during that month, and pretty nearly all the available productive capacity is required. The maintenance of the October rate at present is due to the momentum of last month, but the general report as to business is that it has merely receded from the abnormal to the normal.

Prices still are very firm. The comment is heard that there could not have been as much of an advance in invoice prices as in quotations from the second to the third quarter of the year or earnings for the latter period would have made a better showing, seeing that high mill operations must have made for low producing costs.

Wire makers are considering a change in nails that will impose an extra of 10c. per 100 lb. on the carload buyer other than wholesale distributors.

The new base prices on hot-rolled flats do not include, as was at first supposed, cooperage stock, on which a new base of 2.10c. or \$2 a ton above the base on narrow strips, has been announced by some makers.

Producers of pig iron continue to seek higher prices, but have not yet

been successful in realizing the latest advances. Steel works scrap has gone down another 25c. per ton. Some melters who were expected to buy, and for delivery to whose plants dealers bought in advance of actual orders, have been able to get along without purchases, and pressure to sell the speculative shipments is largely responsible for the decline. The market also is weakened by the fact that some dealers, believing the upswing to be over, are selling short when they find a mill willing to pay \$17.50 for heavy melting steel.

Ferroalloys.—The contract price of spiegeleisen for the first half of next year will be the same as that for the past year, or \$30, furnace, for 19 to 21 per cent material. Current prices of all of the commonly used ferroalloys are to carry over into next year. There is a rather brisk spot demand for spiegeleisen, with sales of single carloads at \$33, furnace. Requirements of other alloys are being met largely through specifications on existing contracts. There is no rush by consumers to sign contracts for next year.

Pig Iron.—Producers are seeking higher prices, several having announced an advance of 50c. a ton on foundry iron to \$18, Valley furnace, for No. 2 grade, while for the malleable grade most makers want \$18.50, and on Bessemer as much as \$19 is asked. The common quotation on basic iron is \$18, Valley furnace, but the most recent sale, 4000 tons for December-January delivery to a Pittsburgh district steel company, was at \$17.50 and that was for an iron of somewhat special analysis. Similarly with other grades, the advanced quotations are yet to be realized. A few small sales of foundry iron have been made at \$18, base, Valley furnace, but a considerably larger tonnage is under quotation at \$17.50. To a large extent, quotations of \$18 for basic and \$19 for Bessemer merely indicate that the producers making them have none of these grades for sale at present. Interest in the market on the part of melters is not especially active, as most of them have sufficient iron under contract or in stock to see them

through the remainder of the year. The movement of iron on old orders is much heavier than strictly new business. W. P. Snyder & Co. make the average price of Bessemer iron at Valley furnaces in October \$17.53, compared with \$17.20 in September and \$18 in October last year, and of basic \$17.28, compared with \$16.50 one month ago and \$17 one year ago.

Prices per gross ton, f.o.b. Valley furnace:

Basic		\$17.50 to \$18.00
Bessemer		18.00 to 19.00
Gray forge		17.00 to 17.50
No. 2 foundry		17.50 to 18.00
No. 3 foundry		17.00 to 17.50
Malleable		18.00 to 18.50
Low phos., copper free		26.50 to 27.00

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Wire Products.—Some manufacturers have announced and others are considering adoption of a plan whereby jobbers shall be asked to pay one price for carload lots of nails and all other carload buyers an advance of 10c. per 100 lb. extra. The matter still is more or less in a state of flux. Nail and wire business is not holding up to its October gait, but is making a fairly good showing compared with this time last year. Prices are steady.

Sheets.—Except that makers are able to promise more prompt delivery on new orders than they could a few weeks ago, the situation shows no particular change. On black and galvanized sheets, bookings are sufficient to provide full engagement of capacity for two to three weeks and in blue annealed there is at least two weeks' business in sight. On automobile body sheets, leading makers are well sold up for the next four weeks. Incoming business is falling behind shipments, but there has been no let-down in mill operations, which remain at practically full physical capacity. Prices are firm.

Fluorspar.—Leading domestic producers have announced a price of \$18 per net ton, at mines, for gravel spar analyzing 85 per cent or more calcium fluoride and not over 5 per cent silica. It is figured that the recent increase in the duty on imported spar of \$2.50 per net ton will produce a price of \$18, Atlantic seaboard, for the imported material; on that basis foreign spar still can be delivered in this district

for less than the American product at \$18, mines, delivered by rail, but the latter will get the call on the score of more uniform quality and the fact that consumers may get supplies at shorter notice and will not be obliged to buy a cargo at a time. The freight charge on foreign spar from the seaboard to this district ranges from \$3.13 to \$3.48 per ton, while the rail rate from domestic mines is \$5.25, but much tonnage is brought to local consumers by river at a total charge of about \$3.50 per ton.

Tin Plate.—New business in packers' can sizes of tin plate waits on an announcement of the prices for the first half of next year. The fact that some container manufacturers will carry over stocks for which there was no use on account of the abrupt ending of the growing season this past fall is another reason for light forward interest. Much tin plate, however, is being moved to take care of the salmon pack of next spring, and export demands are of sizable proportions. Much interest is observed locally in a reopening of the case of the all-rail rate on tin plate to the Pacific Coast. A hearing will take place soon upon a plea of the Youngstown Sheet & Tube Co. for a reduction in the Chicago rate from 75c. per box to 65c. from its Chicago district plant to counterbalance the reduction of four months ago in the Pittsburgh rate to 75c. The Western railroads are opposing a reduction in the Chicago rate, and it is said an effort is being made to overcome the demand for a lower Chicago rate by lifting the Pittsburgh rate.

Hot-Rolled Flats.—Makers in this district expect this month to be good in strip production and shipments, since the common experience was that last month's shipments, which were of record size from most mills, were closely approximated by incoming business. Makers have firm price ideas on new business for early delivery because they do not need new business very badly. Application of the new base prices and the recently adopted card of extras appears to be more of a first quarter than a current matter. A separate base price for

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 down to and including 2½ in. squares, the price is \$5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a \$5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

Rails

Per Gross Ton

Standard, f.o.b. mill.....	\$43.00

Per Cent Off List

Carbon, 0.10% to 0.30%, base (carloads).....	55
Carbon, 0.30% to 0.40%, base.....	50
Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.	

cooperage stock has been announced by some makers of this line, which embraces widths from ½ in. to 1¾ in. in gages No. 17, 18 and 19, of 2.10c., base Pittsburgh, plus the extras in the recently announced card. Most users are under contract for the remainder of this year and the new base will find more general application on first quarter contracts. Some makers of 3-in. strips also have a separate base on that width of 2.10c.

Cold-Rolled Strips.—Makers here start the new month with good backlogs, and on ordinary current business are demanding 2.85c., base Pittsburgh, or \$2 a ton over the price at which the bulk of current shipments are invoiced.

Semi-Finished Steel.—There has been no letdown in sheet and strip mill operations, and a good movement of billets, slabs and sheet bars on contracts naturally results. Spot demands, however, do not amount to much, and while a premium of \$1 a ton for prompt shipments of billets was paid a short time ago, no such cases have recently come to light. Wire rods are steady at \$42, base Pittsburgh or Cleveland.

Bars, Plates and Shapes.—Incoming business in these products continues to lag behind shipments on older orders, and it is largely because producers had larger bookings than could be rolled and shipped last month that there has been no material reduction in mill operations. The common asking price for all three products is 2c., base Pittsburgh, but actual business at that price seems to be in single carloads for small buyers or for earlier shipment than most mills like to promise. The ordinary tonnage price—and most of the current inquiries are of the ordinary tonnage variety—is 1.95c. The large-lot or preferred buyer is drawing against contracts carrying 1.90c. or less, and the market is not now subject to the test of large in-

quiries. The cost of producing plates is as much of a factor of price and maintenance as the size of the demand.

Rails and Track Supplies.—The Carnegie Steel Co. was awarded 13,310 tons of the 191,550 tons of rails placed by the New York Central Lines, and now has a good backlog. Light-section rails are slow. Demand for track fastenings is light by comparison with the orders for standard-section rails.

Tubular Goods.—The Western Natural Gas Co., having completed organization, is expected to inquire soon for 350 miles of 20-in. pipe for a gas line to run from two gas producing fields in Wyoming to Salt Lake City. Line pipe furnishes most of the backlogs that the mills have, although there is a fairly good demand for seamless oil well pipe and a rather well sustained demand for butt welded pipe. Lap welded pipe for other than pipe lines is not very active.

Cold-Finished Steel Bars and Shafting.—October shipments were very heavy with makers in this district, but did not tax productive capacity. Third quarter contracts were well worked off in the heavy movement of last month. The advance of \$2 a ton is now well established by liberal specifications on fourth quarter contracts. Some doubt exists that another advance will be made for first quarter, although it is contended that the spread between hot-rolled and cold-finished bars is too narrow for fair profits.

Coke and Coal.—Spot furnace coke prices are unchanged, but as the supply situation is somewhat easier, sales at more than \$2.90 per net ton at ovens are becoming fewer. A local steel company which recently put on a blast furnace solved the problem of additional coke supplies by starting some of its old type ovens. Two blast furnaces and possibly a third now operating on Connellsville coke or coke made from Connellsville coal are likely to go out soon for relining and it will be a month at least before the Struthers furnace begins to take coke. Absorption of released coke should make for an easier market unless there is a corresponding reduction in output. Spot foundry coke is moving steadily at firm prices. There is no strength worthy of note in the coal market, because supplies are so plentiful in relation to requirements.

Old Material.—Dealers are finding it difficult to interest steel companies in new purchases of heavy melting steel. Some dealers had bought this grade for shipment to certain points in anticipation of mill purchases, but the mill orders did not materialize, and the dealers have forced the material on the market. The result has been a further decline of 25c. a ton. This grade now is offered at \$17.75 and even at \$17.50, with no takers. Few dealers have needs sufficiently pressing to pay more than \$17.25 to cover their sales. Two companies which were expected to buy scrap in the open market escaped the neces-

sity of doing so by purchases of billet and bloom crops, of which another steel company had a considerable accumulation. One company took 25,000 tons and the other, which secured a supply from still another steel company, bought 10,000 tons. Except for the offerings of scrap which have resulted from bad guessing on the part of some dealers, the supply is not materially greater than it has been. It is probable that the course of prices over the remainder of the year will be governed by the rate of steel works engagement. While incoming business in finished steel is somewhat less than shipments on orders, little recession in ingot production has developed. Continued high ingot output would force additional scrap buying, but the common belief is that there will be some falling off between now and the end of the year and that the mills will try to get along with their stocks and the material they have contracted for. About half of the heavy melting steel in this month's Pennsylvania Railroad list, it is reported, went to Youngstown at about \$18.80 and the remainder to this district at a price lower to the extent of the difference in the freight rates. About 2000 tons of heavy melting steel offered by this road in a special list recently was sold at more than \$19, delivered Youngstown. The November list of the Norfolk & Western contains 4911 gross tons.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:		
Heavy melting steel.....	\$17.25 to	\$17.75
Scrap rails	17.00 to	17.50

Chicago

Steel Sales Again Reach a High Point—Pig Iron Advanced Second Time in Two Weeks

CHICAGO, Nov. 5.—Added needs of miscellaneous steel users, plus heavy purchases of standard-section rails, have brought sales in this district to the highest point of the year and, with one exception, to the highest point in three years. Specifications are fully equal to shipments, which represent ingot output at a shade above 85 per cent of capacity. Forward buying is more active, though 30 to 60 days' requirements is still representative of the average buyer's order. Ingot output is now about 17 per cent higher than a year ago. In September, 1927, both backlogs and shipments began to diminish and little or no improvement occurred in October. This year, ingot output has gradually increased during the fall weeks, and the first week of November finds local mills well entrenched, with the outlook favorable for a sustained rate of shipments. Prices for plates, shapes and bars are stronger, as quotations tend to narrow to a range of 2.05c. to 2.10c. per lb., Chicago.

The railroad equipment market remains active, with inquiries for 9620 cars now pending and considerably more in prospect. Structural awards are not keeping pace with other steel activities, but shops remain well engaged on orders taken in the late summer and early fall.

Pig iron prices, after remaining for a few days at \$19.50 a ton, Chicago furnace, have been advanced another 50c. to \$20 a ton. Liberal purchases have been made at the higher quotations. The scrap market, though recently affected by weakness in the East, has again been strengthened by heavy sales locally.

Pig Iron.—Northern No. 2 iron, after holding a short time at \$19.50 a ton, local furnace, has been advanced to \$20. Numerous sales in large and small lots establish prices at the higher level. A user in Wisconsin will buy 3000 to 5000 tons for first quarter delivery and three nearby foundries will take a total of 3000 tons for delivery over the remainder of the year. Shipments in October were the heaviest in any month so far this year; producers, in analyzing shipping orders on hand, estimate that deliveries from local furnaces in 1928 will establish a record for all time. Sales of Southern iron are frequent at \$22.26 a ton, delivered Chicago. This iron reaches many points of consumption in this territory at a disadvantage in price of not over 50c. a ton. Quotations at \$16.25 a ton, Birmingham, are strong. Demand for charcoal iron is insistent and furnace stocks are smaller and unbalanced. Prices are steady at \$24 a ton, furnace.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	\$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	22.26
Low phos., sil. 1 to 2, copper free	\$29.00 to 29.50
Silvery, sil. 8 per cent.	29.79
Bess. ferrosilicon, 14-15%	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—Contracting for 1929 in ferrosilicon is practically complete, and the bulk of users of ferromanganese have also stated their needs for the coming year. All told, not less

than 12,000 tons of ferromanganese has been added to sellers' books. Carload sales of spiegeleisen in the 19 to 21 per cent grade are being made at \$33, Hazard, Pa.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$88.50; spiegeleisen, 19 to 21 per cent, \$40.76.

Plates.—Active inquiry for railroad cars now in this market totals not less than 9620 cars, which will require about 140,000 tons of steel. The most recent request for prices comes from the Wabash, which will buy 2000 box cars. It is believed by the local trade that part of the steel needed for 3300 cars to be purchased by Canadian carriers will be furnished by Chicago mills. A check made by Western steel producers leads them to believe that not less than 40,000 cars will be in the market before the end of the year and that about one-half of that number will have been placed by Jan. 1. Reports here are that the Santa Fe inquiry will be for 6000 cars, and the Illinois Central is expected to call for bids on 2500 cars. Users of plates expect that deferred deliveries will result from the probable requirements of car builders, and new buying is for more distant needs. Plate mills are now engaged at 80 per cent of capacity. The Texas Corporation is in the market for 2800 tons and the Roxana Petroleum Corporation will buy 2000 tons for tanks. Oil storage tank construction programs are being rushed, and orders placed at mills are usually for immediate shipment. Deliveries on the more common widths of plates range from two to five weeks. Prices in this market are strengthening, and quotations of 2c. per lb., Chicago, are no longer obtainable except on the most desirable business. A more frequent quotation is 2.05c., while 2.10c. is more common than a week ago.

Mill prices on plates, per lb.: 2c. to 2.10c. base Chicago.

Bars.—Orders for mild steel bars are unabated. Automobile parts makers appear to have hit a uniform stride and specifications from that source have not diminished in the last 10 days. Several new models which are to make their appearance this month will call for increased quantities of steel at an early date. Orders

for heavy forgings are well sustained and shops hold close to capacity output. Farm implement manufacturers are swinging into production for spring delivery, and their steel requirements are measurably larger. Prices for mild steel bars are stronger at 2.05c., Chicago, which is rapidly taking the place of 2c. for all but the most attractive business. The iron bar market is without feature. Demand for alloy steel bars is steady and prices are unchanged. Specifications in October for rail steel bars were fully equal to production, which compared favorably with the best months so far this year. New orders are in good total volume, but are individually small and do not afford economical operation. Improved demand is noted from the bed trade, and shipments to barn equipment manufacturers are in good volume. Prices are firm at 1.95c. a lb., Chicago Heights.

Mill prices per lb.: Soft steel bars, 2c. to 2.10c., base, Chicago; common bar iron, 2c. to 2.10c., base, Chicago; rail steel bars, 1.95c., base, Chicago Heights mill.

Cast Iron Pipe.—Three makers of cast iron pipe participated in a contractor's job at Waukegan, Ill. The orders totaled 300 tons and they were taken at \$45.50 a ton, delivered, or \$37, Birmingham. Current orders by railroads seldom reach car lot proportions. Contractors in the North Central States are active on old jobs and the bulk of pipe purchased late in the summer has been delivered.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, \$45.20; 4-in., \$49.20; Class A and gas pipe, \$4 extra.

Structural Material.—Preliminary estimates of the steel needed by the Youngstown Sheet & Tube Co. for extensions to its Indiana Harbor, Ind., plant are placed at 8000 tons, but it is believed that this may be increased by at least 1000 tons. Bridge work, both highway and railroad, is unusually active. Contracts for two highway bridges in Wisconsin call for 2500 tons and a like tonnage will be needed for a bridge at Liberty Bend, Mo. The Northern Pacific will buy 1200 tons for miscellaneous bridge work. A Chicago architect is preparing plans for a warehouse that will require about 10,000 tons. Fabricating shops are busy for this time of the year, but most operations are being sustained by work taken earlier in the year. The pending list is large, but contracting is slow except in small tonnage business. An increase is noted in inquiry for jobs requiring less than 100 tons each. Prices obtained by fabricators are low and no strengthening influence is in sight.

Mill prices on plain material, per lb.: 2c. to 2.10c. base, Chicago.

Reinforcing Bars.—Transactions in this market in the past week were confined largely to orders of less than 100 tons each. The pending list is formidable, and there is now fully as much tonnage on which estimates have been made as there was in the first week of November, 1927. Awards in October were not as heavy as in the corresponding month of 1927. A substantial volume of business in late

summer brought October deliveries to a higher level than a year ago.

Wire Products.—Demand for nails has improved, but lags behind shipments. Manufacturers continue to take liberal quantities of wire. The jobbing trade is spotty, though some improvement is shown in orders from the Northwest and the South. Jobbers continue to buy at close range. Prompt delivery is expected, and producers are forced to carry large and well balanced stocks. Spring terms on woven wire fencing are announced for Nov. 5.

Rails and Track Supplies.—Local mills have taken orders for 185,000 tons of rails. This figure includes the allotments by the New York Central, which placed a total of 191,550 tons, of which 70 per cent is for immediate specification and the remainder is taken on option. The distribution is as follows: Bethlehem Steel Co., 82,030 tons; Dominion Iron & Steel Corporation, 11,690 tons; Carnegie Steel Co., 13,310 tons; Illinois Steel Co., 69,140 tons, and Inland Steel Co., 15,380 tons. The Chicago & North Western inquiry for 30,000 tons is still open. Total inquiry now before local sellers is for 150,000 tons. Although rail buying started earlier than last year, it has not progressed as rapidly as it did in the fall of 1927. Accessory purchases in the week reached 3500 tons for immediate needs and 10,000 tons for future delivery. Fresh inquiry totals 20,000 tons. Prices for tie plates are steady at \$43 a ton. Rail mill output averages a shade above 50 per cent of capacity.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Old Material.—A Chicago mill has closed for 25,000 tons of heavy melting steel at \$15 a gross ton, delivered. Dealers are trading in this grade at \$14.85 to \$15.10 a gross ton, delivered. Lower prices in the East shook confidence a trifle, but after a temporary halting of sales the Chicago market again became active and a number of grades have been sold at

higher prices. Scrap is moving rapidly and unloading tracks are congested at several consuming points. Large shipments of heavy melting steel are moving to Gary mills. The cast iron borings market is strong. Sales have been heavy, and brokers are busy covering their obligations. A producer is asking \$12.75 a ton for November delivery and 25c. higher for shipments in December. Inquiry by malleable and gray iron foundries is unusually active, but individual sales are small, as users decline to carry stocks larger than immediate needs dictate. In some cases buyers are offering stiff resistance to current prices.

Prices deliv'd Chicago district consumers: Per Gross Ton

Basic Open-Hearth Grades:	
Heavy melting steel.....	\$14.50 to \$15.00
Shoveling steel.....	14.50 to 15.00
Frogs, switches and guards, cut apart, and misc. rails	15.75 to 16.25
Hydraul. compressed sheets	12.50 to 13.00
Drop forge flashings.....	10.50 to 11.00
Forg'd, cast and r'd steel carwheels	17.75 to 18.25
Railr'd tires, charg. box size	17.50 to 18.00
Railr'd leaf spring cut apart	17.25 to 17.75

Acid Open-Hearth Grades:	
Steel couplers and knuckles	16.00 to 16.50
Coil springs	18.25 to 18.75

Electric Furnace Grades:	
Axle turnings	14.00 to 14.50
Low phos. punchings.....	16.00 to 16.50
Low phos. plate, 12 in. and under	15.50 to 16.00

Blast Furnace Grades:	
Axle turnings	12.00 to 12.50
Cast iron borings	12.00 to 12.50
Short shoveling turnings..	12.00 to 12.50
Machine shop turnings....	7.50 to 8.00

Rolling Mill Grades:	
Iron rails	15.00 to 15.50
Rerolling rails	17.00 to 17.50

Cupola Grades:	
Steel rails less than 3 ft..	17.50 to 18.00
Angle bars, steel.....	16.50 to 17.00
Cast iron carwheels.....	14.25 to 14.50

Malleable Grades:	
Railroad	15.75 to 16.25
Agricultural	12.50 to 13.00

Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heav.	26.00 to 31.00

Per Net Ton	
Rolling Mill Grades:	
Iron angles and splice bars	14.50 to 15.00
Iron arch bars and transoms	20.50 to 21.00
Iron car axles	26.50 to 27.00
Steel car axles	15.50 to 16.00
No. 1 railroad wrought...	13.25 to 13.75
No. 2 railroad wrought...	13.00 to 13.50
No. 1 busheling	11.50 to 12.00
No. 2 busheling	6.00 to 6.50
Locomotive tires, smooth..	13.25 to 13.75
Pipes and flues.....	9.50 to 10.00

Cupola Grades:	
No. 1 machinery cast....	15.50 to 16.00
No. 1 railroad cast.....	14.50 to 15.00
No. 1 agricultural cast....	14.00 to 14.50
Stove plate	11.75 to 12.25
Grate bars	12.50 to 13.00
Brake shoes	11.75 to 12.25

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Sheets.—Prices are firm, and deliveries average not better than four weeks, with hot mills engaged at 85 per cent of capacity. Light tank manufacturers are taking liberal quantities, but the roofing trade continues to lag behind its usual seasonal activity. Jobbers are distributing a heavy tonnage, but they hold stocks low and depend on mill deliveries to meet current requirements. Backlogs are growing small and in the past few

days specifications have totaled less than production. Spot sales are few in number and of small individual size.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.90c.; No. 24 galv., 3.65c.; No. 10 blue ann'd, 2.15c. Deliv'd prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Coke.—Shipments remain heavy and all ovens in this district are lighted. Quotations for by-product foundry coke are firm at \$8 a ton, local ovens.

Bolts, Nuts and Rivets.—The upturn in specifications noticed a week ago did not hold its ground under the influence of a marked decrease in demand from railroads. Agricultural implement manufacturers, however, are taking liberal quantities. Prices for these commodities are firm.

Ryerson Company Offers Securities to Public

Joseph T. Ryerson & Son, Chicago, on Nov. 2 ceased to be a closed family institution with the offering for public subscription of \$5,000,000 in debentures and 100,000 shares of capital stock. A new corporation known as Joseph T. Ryerson & Son, Inc., has been formed and the financing arises out of the sale of a portion of the Ryerson family holdings. The management of this corporation will remain unchanged. The debentures will be offered at 96 and interest to yield over 5½ per cent, and the stock will be offered at \$39 a share.

The Ryerson business heretofore has not made public its earning statement, due to private ownership. In connection with the financing, net earnings for this year based on operations to Sept. 30 are estimated at \$2,102,000 before Federal taxes. For 1927, net was \$1,669,360. The business was started in 1842 with capital of \$10,000.

Factory Earnings Near a Record

Average weekly earnings in representative factories in New York State are reported by the State Industrial Commissioner to have been \$29.72 in September. This is the second highest figure ever reached, having been exceeded only by the \$29.78 of March, 1927. The gain over August was 34c., while the September figure was 15c. higher than a year earlier. All employees, including both shop and office, are covered in the returns.

Lamson & Sessions Co., Cleveland, will build a bolt and nut manufacturing plant at Birmingham to supply its Southern and Southwestern trade. An 8-acre site has been acquired in North Birmingham and the erection of a moderate sized plant will be started shortly for the manufacture of a complete line of bolts and nuts.

New York

Gas Line to Take 60,000 Tons of Pipe—Pig Iron Prices Still Show Rising Tendency

NEW YORK, Nov. 5.—Pig iron demand is well sustained. Although purchases for first quarter are on the increase, orders are still predominantly for early delivery. Sales in this district during the week totaled more than 14,000 tons. In the main, prices still show a rising tendency. Buffalo foundry iron is firm at \$17.50, base furnace, and a leading producer has announced an advance of 50c. to \$18, effective immediately. Eastern Pennsylvania makers have advanced foundry iron to \$21, base furnace, for first quarter. Quotations on current business, however, have not been entirely uniform. A sale in New Jersey last week brought out a price that figured back to less than \$20, base eastern Pennsylvania furnace. The New York Air Brake Co. is inquiring for 500 tons of malleable, 100 tons of low phosphorus, 100 tons of high manganese and 50 tons of silvery for its Watertown, N. Y., plant. The American Locomotive Co. is in the market for 200 tons of foundry for its Schenectady, N. Y., works. A Connecticut melter wants 1000 tons of foundry iron for delivery in the current quarter. Abendroth Brothers, Port Chester, N. Y., have closed for 250 tons each of No. 2X and No. 1X, and the Foran Foundry & Mfg. Co., Flemington, N. J., has bought 500 tons each of No. 2 plain and No. 2X.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil.	1.75 to 2.25	\$22.41
*Buf. No. 2, del'd east. N. J.		20.78
East. Pa. No. 2 fdy., sil.	1.75 to 2.25	21.39 to 22.52
East. Pa. No. 2X fdy., sil.	2.25 to 2.75	21.89 to 23.02
East. Pa. No. 1X fdy., sil.	2.75 to 3.25	22.39 to 23.52

Freight rates: \$4.91 from Buffalo, \$1.39 to \$2.52 from eastern Pennsylvania.

*Price delivered to New Jersey cities having rate of \$3.28 a ton from Buffalo.

Plates, Shapes and Bars.—The Export Steamship Co., 25 Broadway, New York, opened bids Monday on four 10,000-ton freight boats to be built under the loan provisions of the recently enacted Merchant Marine Bill. An award to a shipbuilding company probably will be made within a few days. The four boats will take 13,000 tons of steel, mostly plates. Other boats of larger tonnage are to be submitted for bids by the same company within a short time. The demand for plates, shapes and bars is steady. Structural steel lettings of the week were in fair aggregate volume, though no individual awards of outstanding size were included. The common price for plates is 2.27½c., New York, but large buyers are being supplied at \$1 a ton less and small buyers are paying \$1 a ton more. The minimum on shapes is 2.19½c., New York, some buyers paying \$1 or \$2 a ton additional. The steel bar price

is strong at 2c., Pittsburgh, for current small lots not covered by contract. Contract customers are being supplied at 1.90c. and 1.95c., Pittsburgh.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.29c. to 2.34c.; plates, 2.22½c. to 2.27½c.; struc. shapes, 2.19½c. to 2.22½c.; bar iron, 2.14c. to 2.24c.

Pipe.—The Texas Corporation has inquired for 530 miles of 12¼-in. o.d.

*No. 28 and lighter, 36 in. wide, 20c. higher per 100 lb.

pipe for a gas pipe line to connect Tulsa, Okla., with Lockport, Ill., amounting to 60,000 to 70,000 tons, but the award is understood to be dependent on the outcome of negotiations for the marketing of the gas. Two or three other gas lines, which will take upward of 100,000 tons of pipe, are also in a tentative stage.

Sheets.—A good many consumers whose specifications in September were believed to be sufficiently heavy to cover a considerable part of their fourth quarter requirements have come into the market for additional supplies, and their orders have been booked at the current prices, which are higher in the case of black and galvanized sheets than the invoice prices of recent shipments. Although mills have made no announcement regarding first quarter prices, an advance of \$2 a ton on some grades seems to be expected. The volume of current business is very satisfactory in view of the heavy commitments still to be discharged from mill books. Prices are firm at Pittsburgh bases of 2.75c. for black, 3.50c. for galvanized and 2c. to 2.10c. for blue annealed, depending on width.

Reinforcing Bars.—Business has been rather quiet in the last week, the majority of the jobs placed having called for less than 100 tons. No action has been taken on the Delaware, Lackawanna & Western Railroad terminal at Jersey City, calling for 8500 tons. No new projects of outstanding size have come before the trade recently, but the tonnage in pending jobs bulks large for this time of year. Prices are unchanged.

Cast Iron Pipe.—The market is very quiet, but improvement in municipal lettings is expected after the election, involving projects to be voted upon by the electorate. Warwick, R. I., has not yet awarded 14,000 tons, on which the New York agent for the French maker is low bidder, and action may be postponed for some time. Hartford, Conn., has awarded 80 tons of 6 to 12-in. pipe and fittings to an unnamed maker, and R. D. Wood & Co. are low bidders on a small tonnage of 12-in. pipe for New Brunswick, N. J. Prices are unchanged, with Northern foundries continuing to quote a wide range on competitive jobs.

Prices per net ton, deliv'd New York: Water pipe, 6-in. and larger, \$35.60 to \$36.60; 4-in. and 5-in., \$40.60 to \$41.60; 3-in., \$50.60 to \$51.60; Class A and gas pipe, \$4 to \$5 extra.

Coke.—Demand for foundry coke continues rather brisk, with prices unchanged at \$3.50 to \$3.75 per net ton, Connellsville. The standard furnace grade is firm at \$2.85 to \$3.05, Connellsville, but the market is very quiet, largely on account of the continuing warm weather. Standard brands are unchanged at \$4.85 per net ton, ovens, or \$8.56, delivered to northern New Jersey, Jersey City and Newark, and \$9.44, to New York or Brooklyn. By-product foundry coke prices are \$9 to \$9.40, Newark or Jersey City, and \$10.06, New York or Brooklyn.

Warehouse Business.—Jobbers report continued activity and less weakness in prices. Black sheets are quite firm and galvanized sheet prices are being maintained better than for several months, although concessions are still obtainable. Business in structural material and bars is good and some substantial orders have been taken in the past week.

Old Material.—Buying prices have developed a downward movement in the past week, with most grades of scrap 25c. to 50c. a ton lower. A broker shipping No. 1 heavy melting steel to Bethlehem, Pa., is offering \$14.50 per ton, delivered, 50c. less than the previous buying price. Practically no buying is being done for shipment to other eastern Pennsylvania consumers of No. 1 steel. Yard grade is quoted at \$12 per ton, Pottsville, Pa., a reduction of 50c. a ton, but a broker acting as buying agent for a Phoenixville consumer is still paying up to \$13 per ton, delivered. It is difficult to determine the price of heavy breakable cast as the two leading consumers at Harrisburg, Pa., and Florence, N. J., are not accepting shipments. Blast furnace

scrap is quoted at \$9.50 per ton, delivered Bethlehem, Pa., and machine shop turnings at \$11.50 per ton, delivered Phoenixville, Pa. Specification pipe for a Lebanon, Pa., consumer has been reduced 50c. a ton to \$14.50 per ton, delivered.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	\$11.75 to \$12.25
Heavy melting steel (yard)	8.25 to 9.50
No. 1 hvy. breakable cast.	11.25 to 11.75
Stove plate (steel works)	8.75 to 9.00
Locomotive grate bars	9.25 to 10.25
Machine shop turnings	7.50 to 8.00
Short shoveling turnings	7.50 to 8.00
Cast borings (blast furn. or steel works)	6.50 to 7.00
Mixed borings and turnings	6.25 to 6.75
Steel car axles	18.00 to 18.50
Iron car axles	25.25 to 26.25
Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.75
Forge fire	8.00 to 8.50
No. 1 railroad wrought	12.25 to 12.75
No. 1 yard wrot, long	11.25 to 11.75
Rails for rolling	13.50 to 14.00
Cast iron carwheels	13.00 to 13.50
Stove plate (foundry)	9.50
Malleable cast (railroad)	10.00 to 10.50
Cast borings (chemical)	11.25

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast	\$17.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size	15.00
No. 2 cast (radiators, cast boilers, etc.)	14.50

and some producers have about cleaned out the large stock piles they had a few months ago. Pickands, Mather & Co. on Monday blew in a furnace in Toledo, which had been out for relining.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	\$19.50
S'th'n fdy., sil. 1.75 to 2.25	22.25
Malleable	19.50
Ohio silvery, 8 per cent.	28.00
Basic Valley furnace	\$17.50 to 18.00
Stand. low phos., V'ley fur.	26.50 to 27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Iron Ore.—An exceedingly tight market has developed through the scarcity of vessel tonnage. Ore firms could easily supply all the additional ore that might be needed were they able to ship it before navigation closes. The scarcity of basic pig iron and the advance in pig iron prices have caused the Struthers Furnace Co., Struthers, Ohio, to decide to blow in its stack about Dec. 1, but this furnace had considerable difficulty in finding ore that can be delivered this year. Ore firms have their vessels scheduled for ore cargoes until the close of the navigation season, although at present rates they would find it more profitable to divert some of their boats to the grain trade. Much of the wild tonnage of vessel companies interested only in transportation is now handling grain. The Struthers company has succeeded in securing several lots aggregating 100,000 tons and expects to line up enough ore to carry it through the spring. Heavy ore shipments in October brought the total movement for the season ahead of the corresponding period last year. Water shipments during October were 8,453,952 tons, an increase of 1,731,195 tons over the corresponding period last year. The total movement by water until Nov. 1 was 49,719,931 tons, a gain of 613,217 tons over the same period last year.

Fluorspar.—The domestic fluorspar price, which developed a firmer tone previous to the 50 per cent advance in the duty on foreign fluorspar, has been definitely established at \$18 a ton for gravel material, or \$1 a ton advance. One 500-ton lot and several small lots have been sold at the advance. Producers have not yet announced their price for next year.

Coke.—Some of the makers of premium grades of Connellsville foundry coke have opened their books for the first half at present prices and have

Cleveland

Steel Demand From Automobile Industry Takes a Spurt— Pig Iron Advanced 50c. by Lake Furnaces

CLEVELAND, Nov. 5.—The demand for finished steel continues fairly heavy. Specifications received by some of the mills which experienced a lull during part of October showed a gain the past week. The automotive industry is taking a heavy tonnage of steel bars and is crowding the mills for delivery. The demand for structural shapes is well sustained, but plates are only moderately active. Demand from the automotive industry, which has shown some seasonal decline, has taken a spurt with the release of specifications from the Chevrolet Motor Car Co. for steel for 125,000 cars for its new models, the production of which it will start shortly. The quantity released in sheets and strip steel is estimated at 25,000 to 30,000 tons.

New inquiry in the building field is not as active as recently. Considerable repair work is in prospect in the Lake shipbuilding industry, but, with the exception of two car ferries, no new boats are in prospect.

The market has a firm tone. Steel bars are holding to 1.95c., Pittsburgh, and to 1.90c. to 2.05c., Cleveland. Plates and structural shapes range from 1.90c. to 1.95c., Pittsburgh. Cold-rolled strip appears to have been definitely established at 2.85c., Cleveland and Pittsburgh.

The pig iron buying movement for the first quarter has increased in volume and another price advance of 50c. a ton has been made on foundry and malleable grades by Lake district furnaces.

Pig Iron.—Buying has increased in volume and a further price advance of 50c. a ton on foundry and malleable grades has been made by Cleveland and other Lake furnaces. The advance does not appear to check buying, as producers report sales at the new prices. Prices now are \$2 to \$2.50 a ton higher than those prevailing in the summer, when foundries

covered for the last half. An Ohio steel maker has purchased 15,000 tons of basic iron at \$17.50, furnace. This will be shipped from the same producing point to the same consuming point as a 10,000-ton lot, the sale of which at the same price, was reported a week ago. The freight rate is \$1.65, compared with a \$1.26 Valley rate, making the price equivalent to \$17.89, Valley furnace. Sales of foundry and malleable iron by Cleveland interests totaled 69,000 tons the past week. While most of the iron was for the first quarter, there were quite a few prompt shipment orders. Cleveland furnaces now quote foundry and malleable iron at \$18.50 for outside shipment and at \$19, furnace, for local delivery. Other Lake furnaces serving central and western Ohio and Indiana quote \$19. In Michigan, there is a price range of from \$19.50 to \$20. Some of the Valley furnaces have marked up their price to \$18 for foundry and to \$18.50 for malleable. Low phosphorus iron has not yet moved up with other grades, some small-lot business having been taken at \$26.50. Shipments continue heavy,

*Net base, including boxing and cutting to length.

taken a few contracts. Foundries are running well in this territory. Specifications are good, although there is not much new business. Prices are unchanged. Ohio by-product foundry coke is quoted at \$7.75, Painesville.

Bolts, Nuts and Rivets.—The volume of bolt and nut business in October showed a gain of from 5 per cent to 10 per cent over that of the previous month, and business in November has started out well. Orders are good from the automotive industry, and makers report a steady demand from the railroads. Rivet business also shows quite an improvement; a leading local manufacturer reports that its October volume was the best of any month this year.

Sheets.—While new business fell off in this territory the past week, mills are getting heavy specifications from the automotive industry and tonnage entered is holding up to shipments. Buyers are experiencing difficulties in finding mills that can make shipments as soon as desired, as the best deliveries are two weeks on galvanized and three to five weeks on other grades. The market generally has a firm tone, although price cutting has not entirely disappeared.

Strip Steel.—Specifications are heavy for both hot and cold-rolled strip. Some hot-strip business in small lots has been taken at the new prices and based on the new card of extras. Two producers of cold-rolled strip in this territory have followed other mills in marking up their price to 2.85c., Pittsburgh and Cleveland, which is now generally in effect. Consumers covered heavily before the advance.

Semi-Finished Steel.—Some small lot inquiries are coming out, but a local producer is unable to quote on these, being sold up for the remainder of the year. Sheet bar consumers are pressing for deliveries.

Reinforcing Bars.—A \$2 a ton price advance on rail steel bars to 1.95c., mill, has been made by a western Pennsylvania mill. It is stated that the advance has been necessitated by a \$4 a ton increase in the price of rerolling rails. New billet steel bars are still available at 1.85c., Cleve-

land. Inquiry is confined to small lots.

Wire Products.—Nails show a firmer tone, although occasional shading is reported. The demand is moderate. Wire is active and firm.

Old Material.—Indications of an easier tone, which appeared more than a week ago, have become more pronounced, and prices have declined 50c. to 75c. a ton in some sections. The weakness is mostly on steel making grades. Locally, the weakening effect so far has been only sentimental, as prices here had not advanced to the extent that they did in the Pittsburgh and Youngstown districts. The demand is less active than it was, as some of the mills are now regulating shipments, and brokers are being offered more scrap than they need. In spite of the easier situation on other grades, blast furnace scrap has strengthened in the Cleveland market, selling as high as \$11.50 to dealers. In the Valley district, \$17.50 seems to have become the ruling mill price for No. 1 heavy melting steel, but dealers are offering only \$16.75 to \$17 for Youngstown delivery. In Detroit, dealers are offering 50c. to 75c. a ton less for scrap than a few days ago.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel.	\$14.50 to \$15.00
No. 2 heavy melting steel.	14.00 to 14.50

Rails for rolling	16.25 to 16.50

this quarter and at \$20.50 per ton for next quarter, prior to the advance, but sellers did not, in most cases, offer the usual opportunity to consumers to cover at the old price. At present, buying is small, but the principal consumers are said to be showing more interest in covering for the first quarter. Basic iron is strong, eastern Pennsylvania furnaces quoting on a basis of \$19.50 per ton, furnace. About 20,000 tons of basic for a Coatesville, Pa., consumer has not yet been closed. Demand for low phosphorus continues good, sellers reporting active buying by wire rod producers and manufacturers of rolls. The New York State producer of low phosphorus iron reports its stocks considerably reduced, but does not expect to blow in its furnace until next year.

Prices per gross ton at Philadelphia:

Philadelphia

Pig Iron Advanced 50c. a Ton—Scrap Prices Decline—Easier Tone in Steel Market

PHILADELPHIA, Nov. 5.—A decrease in the volume of new steel business is evident. Mills continue a good rate of operation, but deliveries are less extended on most products.

Foundry iron prices have been advanced by eastern Pennsylvania furnaces to \$20.50, furnace, for the rest of this year and to \$21, furnace, for first quarter delivery. Iron and steel scrap is decidedly weaker, recent sales showing reductions in price of about 50c. a ton, and sellers are freely offering to sell other grades at lower levels.

Ferromanganese.—Large consumers are not all covered for next year. Contracting for British ferromanganese is reported to have been rather small. For delivery throughout 1929, the quotation is \$105 per ton, seaboard.

Pig Iron.—Eastern Pennsylvania furnaces have advanced foundry iron to \$20.50 per ton for delivery to the end of this year and to \$21 per ton, base, for first quarter contracts. Some tonnage was closed at \$20 per ton for

lots. Deliveries range from about 10 days to three weeks. Bids for the building of four vessels, requiring 13,500 tons of plates, for the Export Steamship Co., New York, were opened today. The Department of Water Supply, Philadelphia, opens bids this week on a fabricated pipe line at Lardner's Point, for which about 9000 tons of plates will be required. Diamond pattern floor plates have been advanced \$2 a ton to 3.65c. per lb., Pittsburgh.

Sheets.—Occasional concessions of \$1 a ton from 2.75c., Pittsburgh, on black sheets continue to be reported, but the market on galvanized is firm at 3.50c., Pittsburgh, or 3.82c., Philadelphia. Blue annealed sheets are unchanged at 2c. and 2.10c., Pittsburgh, or 2.32c. and 2.42c., Philadelphia. There are reports of business taken at less than 2c., Pittsburgh, for blue annealed sheets narrower than 45 in., but sheet producers believe that these refer to sales of continuous mill sheets. Local consumers are specifying freely on their contracts and buying some additional tonnage.

Warehouse Business.—With some jobbers, October was the best month of the year and in most cases it is reported as considerably ahead of September. This month shows a continuation of active buying, and prices are being maintained with less shading than usual.

Imports.—In the week ended Nov. 3, 6935 tons of iron ore arrived at this port, of which 6700 tons was from Algeria and 235 tons from Spain. A total of 612 tons of chrome ore arrived from Portuguese Africa. Pig iron imports were 2100 tons from the United Kingdom and 152 tons from the Netherlands. Steel arrivals were as follows: From Sweden, 31 tons of steel billets and 42 tons of steel bars; from the United Kingdom, 15 tons of steel hoops, 8 tons of strip steel and 15 tons of steel scrap; from Germany,

57 tons of structural shapes, 16 tons of steel bars and 10 tons of steel scrap; from France, 10 tons of structural shapes and 501 tons of skelp.

Old Material.—Based on recent sales and the prices at which dealers are freely offering to sell most grades of scrap, the market is off about 50c. a ton. It is generally conceded that the maximum price of No. 1 heavy melting steel today is \$16 per ton, delivered, and a small tonnage has been sold to an eastern Pennsylvania mill at \$15.50. No. 2 grade has been bought by a Harrisburg consumer at \$12.50 per ton, delivered, and by a Pottsville, Pa., mill at \$12.75, delivered. Heavy breakable cast has declined to \$16 per ton on a recent sale to a Pottsville, Pa., consumer. One broker has sold 1000 tons of cast iron carwheels at \$16.50 per ton, delivered. Although transactions are not reported in other grades, brokers are offering to accept orders at about 50c. a ton less than the recent price peak.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel.	\$15.50 to \$16.00
Scrap T rails.....	15.00 to 15.50

above last year's 93,949 tons. A decline of 14 per cent in shipments from India and almost complete stoppage of those from Germany have been more than offset by an increase of over 24,000 tons coming from the United Kingdom, which holds first position this year, against third position last year.

Automobile Output Passes 4,068,000 in 10 Months

Production of cars and trucks during the first 10 months this year reached 4,068,727, surpassing all previous marks for a corresponding period, according to reports to the National Automobile Chamber of Commerce. The previous high mark for the first 10 months was in 1926, when 4,062,110 cars and trucks were turned out.

October output was estimated at 397,000 motor vehicles, compared with 434,915 in September, and 227,510 in October last year. October was 75 per cent greater than October, 1927, but 8 per cent under September, this year.

Reports indicated that more than 800,000 American cars and trucks would be sold outside of the United States this year. During the first nine months more than 627,000 vehicles were shipped to 107 countries. This foreign demand exceeds last year's high mark of 643,634 vehicles.

Spanish-English editions of standard specifications of the American Society for Testing Materials, published by the Superintendent of Documents, Government Printing Office, Washington, for sale at 5c. per copy, have now appeared for carbon steel and alloy steel axles and other forgings for railroad use and for welded and seamless steel pipe.

Van Norman Machine Tool Co., Springfield, Mass., on Oct. 1 took over the sale of its products for garage and automotive trade, such as valve grinders, etc., which have been marketed through the Van Dorn Electric Tool Co., Cleveland. The Van Norman company will also market electric tools made by Stanley Rule & Level Division, Stanley Works, New Britain, Conn., including electric drills and other small tools, to automobile and garage trade. Distribution will be through jobbers. Leo F. Hunderup has been appointed sales manager.

A new Prest-O-Lite gas plant has commenced operations in Birmingham, Ala., to supply the local demand for dissolved acetylene used in oxy-acetylene welding and cutting. With this addition, the Prest-O-Lite chain now numbers 34 acetylene producing plants situated in industrial centers throughout the country.

Decline in Pig Iron Imports in September

Imports of pig iron in September are reported by the Department of Commerce at 10,437 gross tons. This is a reduction of 20 per cent from the August incoming movement of 12,990 tons, but is much higher than the 6055 tons for July. A marked change has taken place in the origin of pig iron, compared with August. The

Netherlands supplied 40 per cent of the September total, followed by British India with 36 per cent and the United Kingdom in third position. In the preceding month British India supplied almost 60 per cent and shipments from the Netherlands were below those from Great Britain. Imports in September almost balanced the exports of 10,228 tons.

For the first nine months the total of 104,777 tons is about 11 per cent

UNITED STATES IMPORTS OF PIG IRON BY COUNTRIES OF SHIPMENT (In Gross Tons)

Pacific Coast

Oil Storage Tanks Take Upward of 4000 Tons of Plates— Steel Demand Less Active

SAN FRANCISCO, Nov. 3 (*By Air Mail*).—Featuring the Pacific Coast iron and steel markets this week was the award of a number of oil storage tanks, calling for more than 4000 tons of plates, to the Western Pipe & Steel Co. Demand, generally, is by no means active.

Pig Iron.—This market is quiet. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic		\$25.00 to \$26.00
*Utah fdy., sil.	2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil.	2.75 to 3.25	24.00 to 25.00

*Delivered San Francisco.

**Duty paid, f.o.b. cars San Francisco.

Bars.—The only award in excess of 100 tons this week called for 350 tons for highway work in Ventura County, and was placed with S. Pearson of Santa Monica, Cal. Inquiries include 188 tons for a bridge near Benham, Cal.; 129 tons for a bridge in Orange County, Cal., and 114 tons for a bridge near Wolf Point, Mont., across the Missouri River. Quotations on out-of-stock material, both in Los Angeles and San Francisco, are about 1.80c., base. On merchant bar steel, 2.35c., c.i.f., appears firm both at San Francisco and Los Angeles.

Plates.—Improvement in demand for plates is noted. Outstanding awards were 1800 tons for six 118,000-bbl. tanks for the Texas Co., Los Angeles; 1650 tons for three 170,000-bbl. tanks for the Wilshire Oil Co., and 565 tons for one 80,000 and three 10,000-bbl. tanks for the Hancock Oil Co., Los Angeles, all placed with the Western Pipe & Steel Co. Opening of bids on 231 tons of 24-in. riveted pipe for Seattle has been postponed until Nov. 2. Bids were opened this week on 185 tons of 20-in. shore pipe for the United States Engineer Office, San Francisco. Prices continue to range from 2.20c. to 2.25c., c.i.f. Coast ports.

Shapes.—Only one award exceeding 100 tons was reported in the week. This was 175 tons for a telephone building at San Bernardino, Cal., and was booked by the Union Iron Works. An award is expected within a few days on 2300 tons for the Methodist Book Concern Building in San Francisco, on which the McClintic-Mar-

shall Co. is low. Inquiries of the week include 300 tons for two apartments on Broadway, San Francisco; 170 tons for a bridge near Benham, Cal., and 667 tons for a bridge over the Missouri River near Wolf Point, Mont. On the latter project, the Missouri River Valley Bridge & Iron Co. is low bidder. Plain domestic material continues firm at 2.35c., c.i.f.

St. Louis

Pig Iron Sales of 45,000 Tons Include 33,000 Tons of Basic— Steel Demand Continues Active

ST. LOUIS, Nov. 5.—Heavy sales again featured the pig iron market, with the demand for basic in the lead. Of total sales of 45,000 tons by the St. Louis Gas & Coke Corporation, the basic total was 33,000 tons, divided into lots of 15,000 tons, 10,000 tons, 6000 tons and 2000 tons, the second and last-named orders for delivery this year, and the remainder for first quarter of next year. All of the basic sales were to melters in the St. Louis industrial district. Buying has been largely by makers of steel underframes for railroad cars. Of 11,450 tons of foundry iron, all for first quarter, 7800 tons was sold to radiator manufacturers in lots of 3500 tons, 3100 tons and 1200 tons, and 3650 tons in lots of 100 to 500 tons, much of which will go to stove manufacturers, who are enjoying an unexpectedly large reorder business. The local maker has advanced its price 50c. a ton to \$20 to \$20.50. The leading Southern maker sold 1000 tons, principally for prompt shipments, to stove manufacturers. Southern interests have not opened their books for first quarter.

Prices per gross ton at St. Louis:

No. 2 fdy., sil.	1.75 to 2.25, f.o.b.
Granite City, Ill.	 \$20.00 to \$20.50
N't'n No. 2 fdy., deliv'd St. Louis.	21.66
Southern No. 2 fdy., deliv'd	20.67
Northern malleable, deliv'd	21.66
Northern basic, deliv'd	21.66

Freight rates: 81c. Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Coke.—Shipments of domestic grades of coke have been heavy from by-product ovens to out-of-town dealers as a result of colder weather. Dealers in St. Louis, proper, however, continue to buy in small quantities, permitting the ovens to carry stocks for them. The heavier melt has brought increased buying of metallurgical grades.

Rails and Track Supplies.—The Missouri Pacific has issued an inquiry for 4,000,000 tie plates, 2,000,000 of which are to be copper bearing. Inquiries for rails for 1929 are expected to be issued shortly by the lines centering here.

Cast Iron Pipe.—H. E. Conner, Redwood City, Cal., took 144 tons of 4 and 6-in. Class B pipe for the improvement of E Street, Tulare, Cal. Bids on 1284 tons of 24-in. Class B pipe for Seattle were held over until Nov. 2. For this project alternate bids are also being taken on riveted steel pipe. Lewiston, Idaho, has opened bids on 109 tons of 2 to 8-in. Class B pipe.

Steel Pipe.—The Hancock Oil Co., Los Angeles, has awarded a contract for 10 miles of 4-in. and 10 miles of 6-in. line pipe, requiring about 800 tons, to Allen Brothers, Inc. Oil country goods continue to move well in the southern part of the State.

Finished Iron and Steel.—October was a very satisfactory month, with bookings not quite so heavy as in September, although sufficiently large to insure 100 per cent operations, according to the Granite City Steel Co. The demand for all grades of sheets, including galvanized, black and blue annealed, continues unabated, with prices firmer than they have been for many months. The demand for plates in the district is not exceptionally heavy, although sufficient to operate this department of the Granite City Steel Co. almost at capacity. Warehouse business in October ran from 10 to 15 per cent ahead of the preceding month and October, 1927.

Old Material.—The market for old material continues strong. Although heavy melting and heavy shoveling steel are unchanged, other price advances are recorded. Miscellaneous standard-section rails, railroad springs, No. 1 busheling, cast iron borings, rails for rerolling and steel angle bars are 25c. a ton higher, while No. 1 railroad wrought is up 50c. a ton. Wrought iron bars and transoms, in which there has been no activity until this week, jumped \$1.75 a ton, and railroad malleable advanced \$1. The fact that large car orders are expected in the district has added

Relay. rails, 70 lb. and over		26.50 to 29.00

Detroit

Automobile Production Ahead of a Year Ago

DETROIT, Nov. 5.—Automobile production for October, estimated at 397,000 units, is approximately an 8 per cent decline from the production of the previous month, and is reflected in the employment barometer of the Employers' Association of Detroit, which has shown a total decrease of 11,600 during October. A total of 285,936 individuals on the combined payrolls of representative firms employing two-thirds of the city's industrial population is 3648 less than that of the week previous, but is 93,525 ahead of the same period a year ago.

The Ford Motor Co. has in the past week surpassed all employment records, with a total of 186,313 individuals on the payroll. The two large local plants are now employing 125,000 men. The production rate on the model A cars has reached 6000 daily, with a total of 615,000 units of that line in service. A special body style is being planned by the Ford company, which will be priced about \$100 higher than the regular line. Production on the deluxe model will be begun about the first of the year.

The Willys-Overland Co. has reduced its production, and is preparing to get under way on the new Whippet model before the first of the year.

An increase of about 50 per cent is being planned for the plant of the Wire Wheel Corporation of America, which is now turning out about 52,000 wheels a month.

The J. W. Brown Mfg. Co., now working on 10-hr. shift, expects to add a night shift in the next three weeks. This company has received a large order from the Ford Motor Co.

In the structural market, firmness

of structural shapes, bars and plates has succeeded in bringing out a substantial amount of industrial work in small jobs. Speed of erection is an important factor, and the number of bidders on any one job is inclined to be low. The small shops for the past six or eight weeks have been busy and

at the present time have approximately three weeks' work ahead. The large shops are practically filled up for the remainder of the year.

Bids are being taken on the National City Bank of Battle Creek, which will include about 400 tons of structural steel.

Boston

Price Advance by Buffalo Furnaces Not Fully Established by Sales of the Week

BOSTON, Nov. 6.—The recent advance to \$17.50, base furnace, on Buffalo pig iron has not been adhered to in all of the transactions of the past week. The new prices are being obtained in some instances, however. Buffalo furnaces have solicited car lots at \$17 per ton, furnace base, and furnaces east of Buffalo have made cuts on sizable tonnages. A furnace took 1000 tons of No. 2X iron at less than \$22 a ton, delivered, the actual figure being at or close to \$21.50, according to the purchaser. About two-thirds of the 8000 tons sold by furnace representatives here the past week is to be delivered this year, the rest early in 1929. Sales included 1000 tons of No. 2X to a Massachusetts foundry, 1000 tons No. 2X and No. 1X to another New England consumer, 1000 tons No. 2 plain and No. 2X to a New Jersey melter and many smaller tonnages.

Foundry iron prices per gross ton deliv'd to most New England points:

*Buffalo, sil. 1.75 to 2.25..	\$22.41

*Including quantity differentials.

Cast Iron Pipe.—Prices on small pipe have been advanced \$1.50 to \$2 a ton. For 4-in. stock, \$46.10 a ton, delivered common Boston freight rate points, is the prevailing price, and for 6 to 12-in. stock, \$41.10. The market for 16 in. and larger pipe is openly \$40.10 a ton, but concessions undoubtedly can be obtained on desirable tonnages. Salem, Mass., will close bids Nov. 6 on 100 tons of 6-in. pipe. Private business is exceptionally good for this time of the year.

Old Material.—Shipments of old material out of New England are holding up well, and there seems to be a somewhat better demand for machinery cast from New England foundries. Brokers report that material is coming out more freely, probably because of a feeling among owners that the advance in values has been checked. On the surface there appears to be a little easier market for heavy melting steel, yet all transactions reported in this territory the past week have continued within a range of \$11.50 to \$12 a ton, on cars, shipping point. The export market is at a standstill, presumably because of the inability of shippers to secure vessel space at desired rates.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	\$11.50 to \$12.00
Scrap T rails	 11.00 to 11.50
Scrap girder rails	 10.50 to 11.00
No. 1 railroad wrought	 11.50 to 12.00
No. 1 yard wrought	 9.50 to 10.00
Machine shop turnings	 7.00 to 7.50
Cast iron borings (steel works and rolling mill)	 6.25 to 6.60
Bundled skeleton, long	 9.00 to 9.50
Forge flashings	 9.50 to 10.00
Blast furnace borings and turnings	 6.25 to 6.60
Forged scrap	 7.00 to 7.50
Shafting	 14.50 to 15.00
Steel car axles	 16.50 to 16.75
Wrought pipe 1 in. in diameter (over 2 ft. long)	10.00 to 10.50
Rails for rolling	 11.00 to 11.50
Cast iron borings, chemical	10.00 to 10.25

Prices per gross ton deliv'd consumers' yards:

Textile cast	 \$14.00 to \$14.50
No. 1 machinery cast	 15.50 to 16.00
No. 2 machinery cast	 13.50 to 14.00
Stove plate	 11.00 to 11.50
Railroad malleable	 15.00 to 15.50

Coke.—The New England Coal & Coke Co., Boston, and the Providence Gas Co., Providence, R. I., have announced that no change will be made in the contract price of foundry coke of \$11 a ton, delivered within a \$3.10 freight rate zone. That price has

been in effect for at least six months. Both companies have opened their books for first half contracts.

Fabricated Steel.—Bids have been asked on 4000 tons of fabricated steel for the United Shoe Machinery Cor-

poration's Boston office building. In addition, there are many small inquiries. Fabricators, however, are sadly in need of tonnages, and some low prices are being made even on small jobs.

Birmingham

Heavy Demand for Finished Steel Continues But Pig Iron Buying Is Light

BIRMINGHAM, Nov. 5.—The pig iron market has been unusually quiet in the past two weeks, only a few small-lot sales being reported. Nearly all melters are covered for the year and they have shown little interest in first quarter iron. Shipments are slightly greater than production. The base price remains at \$16.25 for deliveries during November and December. The Tennessee company has changed its Ensley No. 2 and 4 furnaces from foundry to basic iron. The No. 2 furnace of the Republic Iron & Steel Co., blown out last June for relining, is now ready for operating. Eighteen furnaces are in blast, of which 13 are on foundry, four on basic and one on ferromanganese.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.....	\$16.25
No. 1 fdy., 2.25 to 2.75 sil.....	16.75
Basic	16.25

Finished Steel.—No evidence appears of a letup in the heavy buying of the past several weeks. Bars, plates and shapes are doing better than at any time in the past several seasons. Mills are adhering closely to quotations. Rail inquiries are increasing, and the Tennessee company is expected to announce the reopening of its Ensley rail mill by the middle of this month. Structural steel lettings have been light during the week, but some good tonnages are up for figures. Reinforcing bar manufacturers are securing enough tonnage in small orders to maintain backlogs. Structural plate works report a good run of inquiries. The Tennessee company is now operating five open-hearths at Ensley, an increase of two during the

week. Seven remain in operation at Fairfield, and the Gulf States Steel Co. is working four at Alabama City.

Cast Iron Pipe.—The market is quieter than it has been in some time. Recent inquiries have involved small tonnages. Plants are operating at 60 to 70 per cent of capacity, and even at this rate backlogs are being reduced considerably. Makers are holding closely to the quotations of \$36 to \$37 on 6-in. and larger sizes, and it is reported that an advance of \$1 a ton on the smaller orders will be made shortly.

Coke.—New sales continue light. Most foundries are well covered through the first quarter. The Woodward Iron Co. placed 22 additional ovens in operation last week and is now operating 222 of its 230 ovens. Other operations in the district are the same. Prices are unchanged, quotations being \$5 for both spot and foundry coke.

Old Material.—A gradual easing up in the market has developed during the past two weeks. Orders are lighter. No price changes have been made. There has been a decided drop in shipments during the last 10 days.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel.....	\$12.50
Scrap steel rails.....	\$12.00 to 12.50
Short shoveling turnings..	8.00 to 8.50
Cast iron borings.....	8.00
Stove plate	13.50
Steel axles	19.00 to 20.00
Iron axles	21.00 to 22.00
No. 1 railroad wrought...	10.00 to 10.50
Rails for rolling.....	14.00 to 15.00
No. 1 cast.....	15.00

Cast iron carwheels.....	13.00 to 13.50
Cast iron borings, chem...	13.50 to 14.00

Buffalo

Pig Iron Buying at New Prices Emphasizes Strength of Market—Steel Mills Continue High Operations

BUFFALO, Nov. 7.—Buying of pig iron at the new prices has not been heavy, but it has been in sufficient volume to indicate that the new prices

are firm. Furnace stocks are low and shipments against old orders are steady. The melt is apparently heavy. A sizable amount of buying for the first quarter has been done, but considerable requirements are not covered. Inquiry includes several lots, both malleable and foundry, up to 500 and 1000 tons. A fair volume of recent business at the new prices is for delivery in this last quarter, but some will run into the first quarter. An indication of the strength of the market is that a lot of 5000 to 10,000 tons of foundry purchased in this dis-

trict by an outside speculative interest has been taken by a furnace.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25.	\$17.50 to \$18.50
No. 2X fdy., sil. 2.25 to 2.75	18.00 to 19.00
No. 1X fdy., sil. 2.75 to 3.25	19.00 to 20.00
Malleable sil. up to 2.25..	18.00 to 19.00
Basic	17.50 to 18.00
Lake Superior charcoal...	27.28

Finished Iron and Steel.—The operation of local mills continues at top notch. Capacity of all of them is being pushed to get out tonnage. Prices of bars, plates, shapes and sheets continue firm. Wire demand is strong, though seasonal products like road building mesh, etc., show a decline. Reinforcing bar demand is fair, and the price firm at 2.515c., warehouse. The Teachers' College job at Buffalo will require about 300 tons of reinforcing steel. A large volume of metal lath is being sold.

Old Material.—After a slight reactionary tendency caused principally by the action of a large consumer in regulating shipments, the market has again developed strength. The regulatory order is still in effect, but is not quite so rigidly enforced. The strength of the local market is being maintained in part by a heavy demand from outside districts. The Youngstown district is taking heavy shipments of No. 1 heavy melting steel, No. 2 heavy melting steel and hydraulic compressed sheets, while turnings and borings are being sent into Pittsburgh district from Buffalo. The stove plate market has dropped off somewhat, as the principal consumer is out of the market, possibly for the rest of the year. Some small sales of knuckles and couplers and rolled steel wheels have been made at \$17.50.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades

No. 1 heavy melting steel.	\$15.75 to \$17.00

Cincinnati

Pig Iron Users Showing More Interest in First Quarter—Steel Demand Has Eased Slightly

CINCINNATI, Nov. 5.—With prices showing a further tendency to advance, pig iron users are showing greater interest in anticipating first quarter needs. Sales the past week amounted to about 7000 tons, including 1500 tons of Jackson County silvery iron for a Michigan consumer and a like tonnage of foundry iron for a central Ohio melter. A local dealer booked an order for 1000 tons of low phosphorus iron for delivery to an Ohio customer. The chief inquiry is for 2500 tons of foundry iron for a Springfield, Ohio, company. Northern Ohio foundry iron has gone up another 50c. a ton and now is quoted at \$18.50, base furnace, while a Tennessee furnace, which has been taking first quarter business at \$16.25, base Birmingham, has withdrawn that quotation for delivery after Dec. 31. Southern makers are reported to be contemplating an increase of 75c. a ton for the first quarter, although no announcement of the new schedule is expected for a week or two. The only seller at Ironton, Ohio, with stock on its yards, is quoting \$18, base furnace.

Prices per gross ton, deliv'd Cincinnati:
So. Ohio fdy., sil. 1.75 to 2.25.....\$19.89
Ala. fdy., sil. 1.75 to 2.25..... 19.94
Ala. fdy., sil. 2.25 to 2.75..... 20.44
Tenn. fdy., sil. 1.75 to 2.25..... 19.94
S'th'n Ohio silvery 8 per cent..... 26.89

Freight rates, \$1.89 from Ironton and Jackson, Ohio; \$3.69 from Birmingham.

Finished Material.—A slight curtailment of buying by steel consumers is seen, although the lull is regarded as temporary. District sheet mills report October bookings were in excess of capacity, but decreased specifications the past week have brought the unfilled tonnage down to a point almost identical with that of a month ago. Production continues at 100 per cent of capacity, with the present scale of operations assured for two weeks. The volume of business has been maintained at a high level. Prices are steady at 4c., base Pittsburgh, for automobile body stock; 2c. for blue annealed; 2.75c. for black, and 3.50c. for galvanized. Recent advances in primary materials, as well as the

strong position of producers, make likely an increase in first quarter sheet prices, according to district mills. Demand for wire goods is sluggish and common wire nails are unchanged at \$2.69 per keg, delivered Cincinnati. Bars, shapes and plates are moving fairly well at 1.95c. to 2c., base Pittsburgh. A nearby maker of rail steel reinforcing bars has increased prices \$1 a ton to a minimum of 1.90c., base mill.

Coke.—A considerably lessened demand for by-product foundry coke the past week suggests the possibility that shipments this month will fall well behind those in October. However, the increased movement of domestic grades is expected to offset partially the slump in foundry coke. By-product coke makers have announced an advance of 50c. and 25c. a ton in egg and walnut sizes respectively, the new schedule effective Nov. 1 being \$5, ovens, on egg and \$3.75 on walnut. Foundry coke is unchanged at \$7, ovens, or \$9.64, delivered Cin-

cinnati. Prices at Detroit also are undisturbed on both foundry and domestic grades.

Old Material.—Heavy melting steel is off 25c. a ton and scrap rails for melting have declined 50c., but other items are firm and unchanged. Since district mills are booking good orders and are likely to maintain operations at a satisfactory rate during the remainder of the year, dealers are not anticipating drastic shrinkage in prices. However, developments of the past week have made them more conservative in purchasing available material. Lists closing this week include the Norfolk & Western, 5000 tons, and Baltimore & Ohio, 9800 tons.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:
Heavy melting steel.....\$13.25 to \$13.75
Scrap rails for melting..... 13.50 to 14.00
Loose sheet clippings..... 9.50 to 10.00
Bundled sheets 10.25 to 10.75
Cast iron borings..... 9.75 to 10.25
Machine shop turnings..... 9.25 to 9.75
No. 1 busheling..... 11.00 to 11.50
No. 2 busheling..... 6.50 to 7.00
Rails for rolling..... 14.00 to 14.50
No. 1 locomotive tires..... 14.00 to 14.50
No. 2 railroad wrought..... 13.50 to 14.00

Dominion Iron and Steel Business Continues on High Level—Prospective Building Construction Large

TORONTO, ONT., Nov. 5.—Canadian business is on an exceptionally high level. Of 10 indicators reported by the Dominion Bureau of Statistics for September, every one exceeded the figure for the previous year and in two cases gains of 75 per cent or more were recorded. While the figures deal with many phases of business, the iron and steel industry easily leads. With 1927 figures equaling 100, business in the pig iron industry in Canada was at 175 for the first nine months of 1928, and steel was at 185 for the same period. Employment advanced to 109; car loadings to 119; building permits, 148; imports, 116; exports, 113; coke, 129; coal, 104.

An indication of Canadian agricultural prosperity has been the extensive purchasing of farm machinery. More business has been done in the farm implement trade in western Canada during 1928 than in any one of the past 15 years, and a further illustration of the increasing purchasing power of the farmer is that most of the transactions have been for cash.

Pig Iron.—Spot sales in October reached a new high record, and the demand is being carried into November. Forward buying was not large in October, although a few small contracts were closed. While some inquiry is coming out for forward delivery, the bulk of new business is for spot shipment. Spot sales hold to a weekly average of about 1200 tons. Some belated water shipments are being made, but as Lake navigation

nears its close such shipments are falling off. Prices remain firm.

Prices per gross ton:

Structural Steel.—Current and prospective business is in large volume. It is estimated that approximately \$20,000,000 worth of structural steel work in Canada is pending. Included in this estimate are large buildings in eastern Canada and a good deal of bridge work for the railroads in western Canada and for the railroads and municipal governments in eastern Canada. Among pending awards are 500 tons for a new hotel at Orillia, Ont.; 350 tons for a garage at Bay and St. Albans Streets, Toronto, for Hyslop Brothers; 200 tons for plant addition for Hinde & Dauch Paper Co. of Canada, Toronto; 2000 tons for Hudson Bay Co. store at Calgary, Alta. Awards include: 100 tons to the Dominion Bridge Co. for club house on Pine Avenue, Montreal; 200 tons to the Sarnia Bridge Co. for General Hospital at Sarnia, Ont.; 150 tons to the Dominion Bridge Co., Redford Building, for addition to plant of Willys-Overland, Ltd., Toronto; 1500 tons to Manitoba Bridge & Iron

Works, Winnipeg, Man., for bridge at Miniota, Man., for the Canadian National Railways.

Old Material.—Hamilton and Toronto buyers continue to place good orders for heavy melting steel and turnings. Machinery cast, stove plate and malleable scrap are also moving freely to consumers throughout Ontario. Montreal dealers report a good demand for heavy melting steel, machinery cast, stove plate and wrought iron and steel axles.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal

Flashings	10.75 to 11.25

Pennsylvania Railroad to Electrify Its Lines

The Pennsylvania Railroad has announced that electrification of its entire service will be continued at a total cost of \$100,000,000. Approval of the plans by the board of directors was made public last week by W. W. Atterbury, president. The work of electrification will be spread over seven or eight years, and will be accomplished by sections.

At present the road is electrified from the Sunnyside yards, Long Island City, to Manhattan Transfer, and from Philadelphia to Wilmington. The latter section has just been completed. The next step will be the electrification of the line between Trenton, N. J., and Philadelphia, which will be completed about 1930. The Newark to New Brunswick section will then be done in about a year and a half, after which the New Brunswick to Trenton section will be undertaken. The next development

will be in and around Pittsburgh. Overhead construction will be used.

In five years the Pennsylvania will require between 250 and 300 electric locomotives. The Copper and Brass Research Association has estimated that the electrification project will call for about 55,000,000 lb. of copper.

Texas and Pacific Buys Machine Tools

The Missouri-Kansas-Texas Railway has bought the following machine tools for use in its shops at Smithville, Tex.: Putnam heavy-duty, motor-driven axle lathe, Putnam 48-in., heavy-duty carwheel borer and Oster motor-driven pipe shearing and cutting machine from Manning, Maxwell & Moore, and a Cincinnati 42-in. vertical boring and turning mill, two United States 18-in., motor-driven floor grinders, Sidney 24-in. lathe and Sidney 18-in. lathe from Huey & Phillips Machinery Co., Dallas, Tex.

Increase in Number of Steel Workers

Iron and steel plants to the number of 201 had 267,160 employees on the payroll in September, compared with 265,848 employees in the same plants in August. The increase was 1/2 per cent. There was, however, a reduction in the amount of payroll, which came to \$8,180,197 for one week in September, against \$8,296,664 for the corresponding week in August, a loss of 1.4 per cent.

Similarly, 981 identical plants turning out foundry and machine shop products showed 247,851 employees in September, a gain of 1.1 per cent over August, while the payroll for one week at \$7,346,854 in September showed a gain of 0.1 per cent over August. Machine tool plants to the number of 145 had 33,099 employees in September, a gain of 11.9 per cent over August. The payroll for one week in September was \$1,077,449, a gain of 12.4 per cent over August.

Imports of Iron Ore Decline

September iron ore imports are reported by the Department of Commerce at 211,494 gross tons, compared with 225,538 tons in August, which was the highest total since last February. The September figures, except for August, are the largest since April,

but are below those of September, 1927, when 224,524 tons came in.

Imports in the first nine months were 9 per cent below those for last year. The total of 1,887,201 tons included considerably more than 1,000,000 tons from Chile, which country accounted for 56 per cent of the aggregate imports. French Africa and Cuba remain respectively in second and third positions. Imports coming from Sweden within the first nine months were only one-tenth as great as last year, due mainly to the strike in the Swedish mines.

Railroad Equipment

Wabash to Buy 2000 Automobile Cars

INQUIRY from the Wabash for 2000 automobile cars was the outstanding development of the week. The Chicago & North Western has inquired for 325 freight cars in addition to the 400 last week and a Texas oil company expects to buy 200 tank cars. Details of the week's business follow:

Lehigh & New England is asking for bids on repairs to 200 50-ton gondola cars.

Richardson Refining Co., Fort Worth, Tex., expects to purchase 200 3000-gal. tank cars.

St. Louis-San Francisco has ordered underframes and parts for rebuilding 10 box cars from American Car & Foundry Co.

Rapid City, Black Hills & Western has ordered one 70-ton locomotive from Heisler Locomotive Works and is inquiring for three observation and two baggage and mail cars.

Central Railroad of New Jersey will rebuild 499 ice cars at its own shops.

Delaware, Lackawanna & Western has ordered two dining cars from Pullman Car & Mfg. Corporation.

New York, New Haven & Hartford is inquiring for 20 underframes for wood baggage cars.

Wabash Railway is in the market for 2000 automobile box cars.

Chicago, Rock Island & Pacific will buy five baggage cars.

Chicago & North Western will purchase 300 flat cars and 25 70-ton hopper cars.

In Germany there are 275 plants manufacturing agricultural machinery and employing 45,000 to 50,000 workers, as against 135, which employed about 25,000 workers in 1913, according to a report received by the Department of Commerce from Trade Commissioner James E. Wallis, Jr., Berlin.

Non-Ferrous Metal Markets

Copper Quiet and Firm, Tin Moderately Active and Steady, Lead and Zinc Without Change

NEW YORK, Nov. 5.

Copper.—Consumers have become decidedly less insistent in placing orders for copper and the runaway conditions, which were regarded as imminent a week ago, have given way to extreme quietness. Consumers both here and abroad have not bought much copper the past week. This has relieved the pressure on producers and left prices where they were. Electrolytic copper is firm at 16c., delivered in the Connecticut Valley, with the price to foreign consumers 16.25c., c.i.f. European ports, as the official quotation of Copper Exporters, Inc. Domestic consumers are fully covered for the rest of the year, and it is esti-

*Refinery quotation; delivered price ¼c. higher.

mated that they have purchased 80 to 90 per cent of their January requirements, with some February metal contracted for. Foreign consumers must still buy some metal for this year and considerable for January and February. The entire aspect of the market has changed, however, in that buying for at least three months ahead has taken the place of hand-to-mouth purchases. Producers have assured consumers that there is copper enough to go around and the fear of a scarcity has practically disappeared. The Lake copper market is also very quiet at 16c. to 16.12½c., delivered.

Copper Averages.—The average price of Lake copper for October, based on daily quotations in THE IRON AGE, was 15.50c. The average price of electrolytic copper was 15.16c., refinery, or 15.41c., delivered in the Connecticut Valley.

Tin.—In the week ended Saturday,

Nov. 3, about 1200 tons changed hands in a quiet market. The business was about equally divided between consumers and dealers. The two most active days were Oct. 30 and Nov. 1, when the sales on each day were about 400 tons. This year's delivery was principally involved, with far futures neglected. Considerable tin was declared for delivery on Nov. 1 against November contracts. Deliveries into consumption in October were 6475 tons, with 4598 tons in stock and landing on Oct. 31. The market today is very quiet, preceding election, with spot tin quoted at 49.25c., New York. Under continued speculative conditions in London, prices today were again higher, with spot standard quoted at £229 7s. 6d., future standard at £224 15s. and spot Straits at £229 7s. 6d. The Singapore price today was £224 10s.

Lead.—Substantial buying by nearly

all classes of consumers is reported in a moderately active market. Orders are mostly for November delivery but some December contracts have been made. Prices are firm at 6.32½c., St. Louis, and 6.50c., New York, the latter being the contract quotation of the leading interest.

Zinc.—This market continues quiet, but producers report a fair amount of business nearly every day. The feature is the continued steadiness of prices at 6.25c., East St. Louis, or 6.60c., New York. The price of ore remains at \$40, Joplin, with production and sales last week again practically offsetting each other.

Antimony.—Chinese metal is unchanged in a very quiet market at 10.50c. for spot and 10.25c. for futures, duty paid, New York.

Nickel.—Ingot nickel in wholesale lots is unchanged at 35c., with shot

nickel at 36c. and electrolytic nickel at 37c. per lb.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Nov. 5.—A substantial volume of spot business has been placed in this market and prices are stronger. The old metal market is active in small-lot sales and prices for the red metal grades are higher.

Prices, per lb., in carload lots: Lake copper, 16.75c.; tin, 50.25c.; lead, 6.40c.; zinc, 6.35c.; in-less-than-carload lots; antimony, 11c. On old metals, we quote copper wire, crucible shapes and copper clips, 12.50c.; copper bottoms, 11.25c.; red brass, 10.75c.; yellow brass, 8.25c.; lead pipe, 5c.; zinc, 3.50c.; pewter, No. 1, 27c.; tin foil, 27c.; block tin, 39c.; aluminum, 12c., all being dealers' prices for less-than-carload lots.

MANSFIELD, OHIO, 800 tons, building for Mansfield Tire & Rubber Co.

CLEVELAND, 150 tons, crane runway for Bourne-Fuller Co.

CLEVELAND, 100 tons, hangar for United States Air Line.

BATTLE CREEK, MICH., 400 tons, National City Bank.

FORT WAYNE, IND., 1500 tons, bank building.

CHICAGO, 10,000 tons, warehouse; Zuckery Davis, architect.

MILWAUKEE, 900 tons, garage.

NORTHERN PACIFIC RAILROAD, 1200 tons, bridges.

SAN FRANCISCO, 300 tons, two apartment buildings, Broadway near Laguarda Street; bids being taken.

Fabricated Structural Steel

Chicago Warehouse Will Take 10,000 Tons— Awards of 26,500 Tons

WITH a warehouse at Chicago calling for 10,000 tons, and a bridge at Longview, Wash., for 13,000 tons, new projects which have come out in the last week totaled 37,500 tons. The following awards, amounting to 26,500 tons, include no jobs of outstanding size:

NEW YORK, 10,640 tons reported to the Structural Steel Board of Trade; 6500 tons in the following jobs not previously reported: Column cores for buildings at Varick and Carleton Streets and at Spring Street and Sixth Avenue, and apartment building at Forty-eighth Street and Third Avenue, to Levering & Garrigues Co.; apartment building at 420 Lexington Avenue, to Paterson Bridge Co.; Midtown Hospital at 309 East Forty-ninth Street and Wilson Publishing Building at 952 University Avenue, to A. E. Norton, Inc.; apartment building at Eighty-sixth Street and East End Avenue, to Lehigh Structural Steel Co.

BROOKLYN, 250 tons, building for Brooklyn Ash Removal Co., Inc., to Shoemaker Bridge Co.

NEW YORK CENTRAL RAILROAD, 800 tons, bridge at Rensselaer, N. Y., to Phoenix Bridge Co.

NEWARK, N. J., 920 tons, hotel at 15 Hill Street, to Hinkle Steel Construction Co.

HOLLAND, N. J., 2000 tons, power house, to Belmont Iron Works.

CUMBERLAND, MD., 1000 tons, plant for Celanese Corporation of America, to Pittsburgh Bridge & Iron Co.

PHILADELPHIA, 2800 tons, Atwater Kent Building, to Shoemaker Bridge Co.

McKEES ROCKS, PA., 225 tons, building for Pressed Steel Car Co., to Pittsburgh Bridge & Iron Co.

MERCER COUNTY, PA., 120 tons, bridge, to Pittsburgh-Des Moines Steel Co.

PITTSBURGH, 300 tons, Madison grade school, to J. E. Moss Iron Works.

PORT ARTHUR, TEX., 1500 tons, refinery for Texas Co., to Petroleum Iron Works.

SOUTHERN PACIFIC RAILROAD, 600 tons, bridges, to American Bridge Co.

BATTLE CREEK, MICH., 650 tons, building for Nichols & Shepard, to Indiana Bridge Co.

DETROIT, 350 tons, additions to plant of Hupmobile Motor Co., to Guibert Steel Co.

DETROIT, 510 tons, Cunningham Store, to Whitehead & Kales Co.

DETROIT, 120 tons, building for Fisher Body Corporation, to Mahon Structural Steel Co.

MILWAUKEE, 200 tons, building for Ladish Drop Forge Co., to Hackendahl & Schmidt, local.

MENOMINEE AND GREEN BAY, WIS., 2500 tons, bridges, to Wisconsin Bridge Co., Milwaukee.

INDIANA HARBOR, IND., 5000 tons, mill building for Youngstown Sheet & Tube Co., to Hansell Elcock Co., Chicago; previously reported as 3935 tons.

SAN BERNARDINO, CAL., 175 tons, telephone building, to Union Iron Works.

LOS ANGELES, 1800 tons, plates for six 118,000-bbl. tanks for Texas Co., to Western Pipe & Steel Co.

LOS ANGELES, 1650 tons, plates, three 170,000-bbl. tanks for Wilshire Oil Co., to Western Pipe & Steel Co.

LOS ANGELES, 565 tons, plates, one 80,000 and three 10,000-bbl. tanks for Hancock Oil Co., to Western Pipe & Steel Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

BOSTON, 4000 tons, United Shoe Machinery Corporation office building.

NEW HAVEN, CONN., 500 tons, armory.

WHITE PLAINS, N. Y., 500 tons, Elks Club.

STANDARD OIL CO. OF NEW JERSEY, 500 tons, oil tanks in Texas.

DURHAM, N. C., 300 tons, dormitory for Duke University.

Reinforcing Steel

Illinois Highway Work Calls for 1000 Tons

AWARDS of less than 2700 tons reported during the last week were considerably under the recent average. New projects, calling for 2400 tons, included 1000 tons for highway work in Illinois. Awards follow:

BROOKLYN, 100 tons, building for Carl H. Schultz Corporation, to Concrete Steel Co.

BROOKLYN, 200 tons, Pizer Building, to Kalman Steel Co.

GLENS FALLS, N. Y., 100 tons, telephone building, to Kalman Steel Co.

PHILADELPHIA, 800 tons, building for Atwater Kent Mfg. Co., to Truscon Steel Co.

CHICAGO, 225 tons of rail and billet steel bars, apartment building at 2912 Commonwealth Avenue, to Concrete Engineering Co.

EVANSTON, ILL., 300 tons of rail steel bars, apartment building, to Calumet Steel Co.

MINNEAPOLIS, MINN., 500 tons of rail steel bars, Hodgson Building, to Inland Steel Co.

ST. LOUIS, 100 tons, garage at Ninth and Chestnut Streets, to Missouri Rolling Mills Corporation.

SACRAMENTO, CAL., 350 tons, highway work in Ventura County, to S. Pearson.

Reinforcing Bars Pending

BOSTON, Brighton district, 220 tons, high school.

BROOKLYN, 165 tons, building for National Lead Co.

BUFFALO, 300 tons, Teachers' College.

CHICAGO, 300 tons, apartment building on Independence Boulevard; A. L. Himelblau, architect.

SPRINGFIELD, ILL., 1000 tons, State highway work.

HELENA, MONT., 114 tons, bridge over Missouri River near Wolf Point; Missouri River Valley Bridge & Iron Co., low bidder.

SACRAMENTO, CAL., 188 tons, bridge over Southern Pacific tracks near Benham; bids Nov. 21.

SACRAMENTO, 129 tons, bridge in Orange County; bids opened.

PERSONAL

J. LESTER PERRY, whose appointment as Worcester, Mass., district manager for the American Steel & Wire Co. was mentioned in THE IRON AGE, Sept. 20, has been associated with the company since young manhood, when he entered the cost department at the Worcester works. He has always been engaged in the Worcester district, comprising plants

man of the rope mill at South works in 1917 and later was assigned to the main office as wire rope engineer. In 1919 he was transferred to the New Haven plant, becoming assistant superintendent in 1922 and superintendent in 1925.

FREDERICK B. RENTSCHLER, president Pratt & Whitney Aircraft Co.,

C. J. FREUND, supervisor of apprentices for the Falk Corporation, Milwaukee, spoke on "Apprentice Training in Foundries" at the regular monthly meeting of the Wisconsin Gray Iron Foundry Group, held at the Republican House, Milwaukee, Nov. 7. HAROLD S. FALK, vice-president and works manager of the Falk Corporation, led the discussion.

JOHN E. OLSON, for many years with the Chicago sales organization of the Niles-Bement-Pond Co., has joined the sales force of the E. C. Cummings Co., 545 West Lake Street, Chicago, representing a number of well known manufacturers of machine tools.

W. H. WILLIAMS, who as vice-president of the Delaware & Hudson Co. was also senior vice-president of its subsidiary companies, the Chateaugay Ore & Iron Co. and the Hudson Coal Co., has resigned and has been succeeded as senior vice-president of the Chateaugay and Hudson companies by F. W. LEAMY, who is also vice-president of the Delaware & Hudson Co. J. R. LINNEY has been appointed vice-president in charge of operations of the Chateaugay and Hudson companies. RALPH W. CLARK, formerly New York manager of Pilling & Co., is vice-president and general sales agent of the Hudson Coal Co. The sales of low phosphorus pig iron made by the Chateaugay Ore & Iron Co. will be handled as heretofore by Pilling & Co., Philadelphia and New York.

DWIGHT E. WOODBRIDGE, Duluth, whose long connection with Lake Superior iron mining has made him well known to IRON AGE readers, has been appointed as directing engineer of Fremont Grant, Inc., 165 Broadway, New York, and will have charge of operations at the company's gold properties in Mariposa County, Cal. Bought by Gen. John C. Fremont in 1843, this tract of 70 square miles was found to carry 14 miles, or about one-fifth, of the great Mother Lode. In all about \$30,000,000 in gold has been taken from the Grant, but for 20 years it has been idle. Active development will begin soon and Mr. Woodbridge will establish operating headquarters at Mt. Bullion, Cal.

JAMES A. FARRELL, president United States Steel Corporation, MYRON C. TAYLOR, chairman of its finance committee, JOHN HULST, vice-president and chief engineer and I. LAMONT HUGHES, vice-president in charge of operations, made a few days visit last week of corporation plants at Lorain, Cleveland and Youngstown.

JOHN A. MANLEY, for the past three years manager of sales development for Fairbanks, Morse & Co., Chicago, has been elected vice-president in charge of sales. He was graduated

M. W. REED

J. L. PERRY

C. F. HOOD

at Worcester, New Haven, Conn., and Trenton, N. J., and had been assistant district manager since 1925. He became assistant superintendent of the North works in 1916, superintendent of the South works in 1917 and superintendent of the North works in 1918, holding the latter position until his promotion in 1925. He succeeds CLINTON S. MARSHALL, who, after 50 years of service with the Steel & Wire company and its predecessor, the Washburn & Moen Mfg. Co., retires from the more strenuous duties of management to become district superintendent. In this position he will act in an advisory capacity.

CLIFFORD F. HOOD and MALCOLM W. REED, who have been named assistant district managers at Worcester, were previously superintendents at the South works and New Haven works, respectively. Mr. Hood was graduated in electrical engineering from the University of Illinois and has been continuously employed at the company's Worcester plants since leaving college except in 1917 and 1918. He began work in the cable department at South works and later served as superintendent of that division. He became assistant superintendent at South works in 1925 and superintendent in 1927. Mr. Reed is a graduate of the United States Naval Academy and served as an ensign in the navy before entering the wire rope department at the North works of the Steel & Wire company. He became fore-

Hartford, Conn., has been made a director of the newly formed Boeing Airplane & Transport Co.

GANO DUNN, president J. G. White Engineering Corporation, New York, has been made an alumni trustee of Columbia University, New York, to serve for six years. He was graduated from that university's School of Mines in 1891. Mr. Dunn is a former chairman of the Engineering Foundation, a former chairman of the National Research Council, and a past-president of the American Institute of Electrical Engineers.

CLIFFORD E. MESSINGER, vice-president Chain Belt Co., Milwaukee, has been elected a director of the Second Wisconsin National Bank, Milwaukee.

HORACE C. KNERR, consulting metallurgical engineer, Philadelphia, will address the Baltimore-Washington chapter of the American Society for Steel Treating at Baltimore on Friday evening, Nov. 16. His subject will be "The Use of Metals in Aircraft Construction."

HOWARD E. OBERG, for several years representative of the Billings & Spencer Co.'s machinery division at Detroit, has been called in to the main office at Hartford, Conn., to become sales manager of the machinery division.

from Northwestern University in 1911 and entered the sales department of the Republic Tire & Rubber Co. After four years with this organization he joined the advertising staff of one of the Chicago newspapers. Later for years he was connected with Hart, Schaffner & Marx, studying the problems of the retail merchants.

FRED C. P. DANIELS, formerly division superintendent of No. 1 open-hearth furnace, steel and roll foundries and shops at the Bethlehem, Pa., plant of the Bethlehem Steel Co., has been named vice-president in charge of operations of the Garrison and Midland plants of Mackintosh-Hemphill Co., Pittsburgh. In this position Mr. Daniels returns to his first field of endeavor, having entered the employ of Mackintosh-Hemphill Co. upon his graduation from Worcester Polytechnic Institute in 1904. In 1911 Mr. Daniels became connected with the Pittsburgh Iron & Steel Foundries Co., Midland, Pa., as assistant superintendent and metallurgist, being particularly interested in the development of and pioneering in alloy products for the rolling mill industry. From 1914 until 1923 he was employed by the Wheeling Mold & Foundry Co., having been intimately connected with the sale, manufacture and use of iron, steel and alloy rolls. From 1923 until 1928 he was connected with the Bethlehem Steel Co.

Visit America for Russian Tractor Plant

A commission of thirteen Soviet engineers engaged on the construction of the new \$17,500,000 Dzherzinsky tractor plant at Stalingrad has arrived in the United States to purchase equipment and arrange for engineering cooperation on the construction and layout. The delegation is headed by Mr. Tsentsipper, chief engineer on the construction work.

"The Dzherzinsky plant, on which work was recently begun, will have an annual capacity of 20,000 tractors and will be the largest tractor factory in the U. S. S. R.," stated Mr. Tsentsipper at the offices of the Amtorg Trading Corporation, New York. "We expect to complete the work by 1930 and to attain an output of 4000 tractors in 1932. The full capacity of the plant will be reached by 1935."

Tractors are also being produced in the U. S. S. R. in the Tractor Division of the Putilovetz Works in Leningrad, which has been producing 1500 tractors annually and is being enlarged to an annual capacity of 5000 tractors. During the current year it is expected to turn out 3000 tractors at the Putilovetz plant.

The Dzherzinsky commission will visit a number of American tractor plants and will arrange with a number of firms for special training of Soviet engineers in American production methods.

OBITUARY

EGBERT HABBERTON GOLD, president Vapor Car Heating Co., Chicago, died Nov. 3, at his home at Holland, Mich. Born at Cornwall, Conn., he went to Chicago in 1890 and was for 15 years manager and director of the Gold Car Heating Co., which was later reorganized as the Vapor Car Heating Co.

RICHARD DEVENS, for the last year associated with the Link-Belt Co., Chicago, as sales engineer for its line of crane products in the Eastern territory, with headquarters at 233 Broadway, New York, died at his home in that city on Nov. 3. He was born at Boston 63 years ago and was graduated from the Massachusetts Institute of Technology in 1888. Prior to his association with the Link-Belt Co., he was for 22 years manager of the New York office of the Brown Hoisting Machinery Co., Cleveland.

WALTER W. NOWAK, European manager for the Niles-Bement-Pond Co. and the Pratt & Whitney Co., died in Paris on Nov. 1. He had been with the affiliated companies since his graduation from Cornell University in 1905, representing them at first on the Pacific Coast and later in Chile, Argentina and Brazil. While in Chile, he secured the contract for the equipment of the central repair shops of the Chilean State Railways, at that time the finest installation of the kind in South America. For the last 10 years, he had been in entire charge of the European business of the companies with headquarters in London and Paris. He was one of the best known American machine tool representatives in Europe.

ALBERT P. PREYER, district manager of sales at Cincinnati for the American Rolling Mill Co., Middletown, Ohio, died Oct. 30 at Hendersonville, N. C., following an attack of pneumonia. He was 43 years of age and a graduate of Cornell University.

SHAFFER N. HOLSTEIN, superintendent of the blooming and bar mills of the American Rolling Mill Co., Middletown, Ohio, died suddenly of acute indigestion on Oct. 29. He was 64 years of age and had been associated with the company for 15 years.

ALFRED G. PLACE, chief electrical engineer for the Youngstown Sheet & Tube Co., Youngstown, whose death in that city on Oct. 25 was mentioned in THE IRON AGE last week, was born at Woburn, Mass., Sept. 27, 1887. He was graduated from the Massachusetts Institute of Technology in 1908. He went to the Sheet & Tube company in 1913 as an electrical engineer. At the time of his death he was vice-

president of the American Institute of Electrical Engineers.

BURTON S. GIER, founder of the Gier Pressed Steel Co., Lansing, Mich., and a director of the Motor Wheel Corporation, died Oct. 19, at Rochester, Minn., aged 61 years. He went to Lansing in 1905 and in 1908 formed a partnership with Elmer Dail, which was known as the Gier & Dail Mfg. Co., to manufacture light pressed metal work. Out of this company grew two manufacturing plants, the Dail Steel Products Co. and the Gier Pressed Steel Co., the latter now being a unit of the Motor Wheel Corporation. Mr. Gier was vice-president and treasurer of the Motor Wheel Corporation until January, 1928, when he resigned on account of ill health.

FREDERICK S. BLACKALL, vice-president and general manager of the Taft-Peirce Mfg. Co., Woonsocket, R. I., whose death occurred on Oct. 6, was widely known as a consulting engineer, contractor and manufacturer of automatic machines, precision tools and printing machinery. He was born in Brooklyn 63 years ago. From 1888 until 1903 he was president of Blackall & Baldwin, New York electrical contractors. At the time of his death, besides his association with the Woonsocket company, he was president of the Interchangeable Parts Co., vice-president and general manager of the Mott Haven Co. and a director of Parks & Parks, Inc. In recent years Mr. Blackall had been forced, on account of ill health, to remain comparatively inactive in the management of his affairs, his son, Frederick S. Blackall, Jr., having assumed many of his responsibilities.

ARTHUR E. PARSON, treasurer and general manager of the Brown-Lipe Gear Co., Syracuse, N. Y., died on Oct. 31, on a train en route from Cleveland to Syracuse, of heart disease. He was 61 years of age and his early work as a patent attorney brought him into close association with the founders of the gear company. He served as legal advisor to the firm for a number of years and in 1911 became actively identified with it.

W. H. SHOEMAKER, consulting superintendent of erection for the Phoenix Bridge Co., Phoenixville, Pa., died suddenly Nov. 3, at his home in Phoenixville. He was 64 years of age and had been with the Phoenix company for about 30 years, the past 17 of which he was superintendent of erection. In August he was appointed consulting superintendent of erection, ill health having forced his partial retirement from business activity.

Machinery Markets and News of the Works

Outlook Continues Favorable

Machine Tool Demand Expected to Maintain Present Pace Through November and Possibly to End of Year

ALTHOUGH sales of machine tools in the past week in some centers fell off slightly, generally attributed to the approach of election day, the volume of inquiry carried over from last month gives reasonable assurance that business in November will at least equal that of October. In fact, the outlook for the remainder of the year is considered favorable.

Automobile companies are reported to have their shop equipment well rounded out for the production of new models, but in general industrial lines there is a good demand for single tools.

Tractor manufacturers in the Chi-

cago territory are looked upon as one of the most promising sources of business, notwithstanding their already large purchases this year. The International Harvester Co. is preparing a large list for its Fort Wayne, Ind., plant, and the Allis-Chalmers Mfg. Co., Milwaukee, intends to make sizable additions to the equipment of its tractor plant at Springfield, Ill.

The White Motor Co., Cleveland, has bought a dozen or more machines for the manufacture of a new type of truck motor. The E. W. Bliss Co., Brooklyn, has continued its purchases of tools for the production of the Bliss Jupiter airplane engine.

New York

NEW YORK, Nov. 5.—A slight falling off in machine tool orders was generally attributed to the fact that it was pre-election week. A good deal of business is pending or in sight, and a continued good demand through the remainder of the year is expected, particularly if the outcome of the election is regarded favorably in business circles. The E. W. Bliss Co., Brooklyn, has placed additional orders for the manufacture of Bliss Jupiter airplane engines. Further expansion of facilities by the Wright Aeronautical Corporation may come within the next few months. Development of the aviation industry is one of the most promising signs for 1929.

Niles-Bement-Pond Co. has sold a 79-in. driving wheel lathe, four four-spindle drum-type milling machines, one eight-spindle drum-type milling machine, a 30-in. x 20-ft. Time-Saver lathe, a Niles-Acme 16-in. shaper, two Morris 3-ft. radial drills, Long & Alstatter I-beam punch, Marshalltown rotary shear, Burke tapping machine, Cincinnati high-speed bench tapping machine, Brown & Sharpe universal grinder, three Ransom grinders and a Cincinnati high-speed two-spindle drill. Pratt & Whitney division sold six No. 2 jig borers, 10 lathes of various types and sizes, No. 3 die sinker, two 6-in. vertical shapers and a No. 12 profiling machine.

Plans are being arranged by Montana Power Co., 25 Broadway, New York, for new hydroelectric power plant near Great

Falls, Mont., with initial capacity of 70,000 hp., to cost more than \$3,500,000 with transmission system.

Liquidometer Corporation has been organized with capital of 110,000 shares of stock, no par value, to take over and expand Liquidometer Co., Thompson Avenue, Long Island City, manufacturer of gasoline gages and other liquid measuring instruments. New company will develop output, including manufacture of seven new types of gages and instruments. A stock issue of \$750,000, is being sold, part of fund to be used for expansion. William S. Yerkes is president.

Kleinert & Klie, 250 Park Avenue, New York, architects, are completing revised plans for a six-story automobile service, repair and garage building at 798-804 Union Street, Brooklyn, to cost more than \$200,000 with equipment.

Crane Co., 836 South Michigan Avenue, Chicago, and 23 West Forty-fourth Street, New York, has purchased property on Dutch Kills Basin, Long Island City, totaling 77,000 sq. ft., for new factory branch and distributing plant, with pipe department, etc. Company has also acquired buildings and property at White Plains, N. Y., for a similar plant.

Hornl Signal Mfg. Corporation, 290 Hudson Street, New York, manufacturer of traffic signal equipment, brass and bronze signs, etc., has arranged for sale of stock, part of fund to be used for expansion in production.

Kent Garage Investing Corporation, 350 Madison Avenue, New York, has purchased property, 100 x 140 ft., at Sixty-first Street and Ninth Avenue, for multi-story automobile service, repair and gar-

age building, to cost more than \$1,500,000 with equipment.

Improved Cinder Co., 90 West Street, New York, has plans for a two-story metal reduction plant, 25 x 130 ft., at Brooklyn, to cost more than \$60,000 with equipment. Kleinert & Klie, 250 Park Avenue, New York, are architects.

Leslie W. Rolfe, 1718 Fifth Avenue, Troy, N. Y., and associates have organized Rolfe Pump & Machinery Corporation, and plans operation of local plant to manufacture pumping equipment, parts, etc. James W. Clark, 39 First Street, is interested in new company.

Western Electric Co., 195 Broadway, New York, has leased six-story building at Johnston Avenue and Pine Street, Jersey City, N. J., for new storage and distributing plant in conjunction with works at Kearny.

Jersey Central Power & Light Co., 20 South Street, Asbury Park, N. J., has purchased property on Raritan Bay, South Amboy, N. J., for new steam-operated electric generating plant, to have initial output of 50,000 kw. It is reported to cost more than \$4,500,000, instead of smaller amount previously noted.

Wright Aeronautical Corporation, Lewis Street, Paterson, N. J., has awarded contract to John W. Ferguson Co., 152 Market Street, for another plant unit, to cost about \$70,000.

Public Service Electric & Gas Corporation, Public Service Terminal, Newark, N. J., is completing plans for two-story power substation at Bloomfield, N. J., to cost over \$65,000 with equipment.

C. F. Pease Co., Chicago, maker of blue print machinery and drafting room supplies, has removed its New York sales room, formerly in Grand Central Terminal, to 12 East Forty-fourth Street where entire seventh floor will be occupied. T. K. Murney is Eastern sales manager.

Vandermark Mfg. Co., 510 Broadway, New York, has been organized to manufacture adjustable curtain rods. Alvah Vandermark is president.

Automatic Electric Steam Corporation, 1 East Forty-second Street, New York, has been organized as subsidiary of Ross Safety Switch Corporation to manufacture electrical equipment for electric steam radiation. Company is licensed under Ross patent rights and principal products are radiator control switches and electric immersion heating elements. All manufacturing is being done under contract.

New England

BOSTON, Nov. 5.—Business in high-production machinery was fairly active the past week. One local house sold a number of machines to Massachusetts manufacturers, but details are withheld. The trade looks for better business before the close of 1928, as there has been a noticeable increase in inquiries for various types of lathes, jig

The Crane Market

NEW inquiry for overhead cranes has been small in the past week, but there is some desirable business pending, and with election past increased business is expected. A number of inquiries for locomotive cranes are in the market from contractors, and two for export have been closed in the past week.

In the Pittsburgh district there is an inquiry for a 5-ton overhead crane from the Westinghouse Electric & Mfg. Co. for its East Pittsburgh, Pa., works. There is also an inquiry for a 5-ton, 44-ft. span crane for the Pottstown, Pa., plant of

McClintic-Marshall Co. and for a 5-ton, 57-ft. span crane for the Enameled Metals Co., Etna, Pa.

In the Chicago district the Western Electric Co., is inquiring for a 2-ton, 70-ft. span crane and a 7½-ton, reel handling crane. The Chicago Bridge & Iron Co., is in the market for a 10-ton electric crane.

Among recent purchases are:

Ulen Contracting Co., 120 Broadway, New York, 25-ton locomotive crane for export from Industrial-Brownhoist Corporation.

Asiatic Petroleum Co., 65 Broadway, New York, 15-ton crawl-tread locomotive crane from the Austin Co.

Carnegie Steel Co., two 15-ton, 37-ft. span, double drum, mill type cranes for the Duquesne works, from Alliance Machine Co.

Ladish Drop Forge Co., Cudahy, Wis., 10-ton, overhead electric crane from a Wisconsin builder.

International Harvester Co., Rock Island, Ill., 10-ton, 39-ft. span, 5-motor, gantry crane from Milwaukee Electric Crane & Mfg. Corporation.

boring machines, presses and drilling equipment.

Used tool dealers are doing practically no direct business with users, but are selling some equipment in single units to salesmen who resell to manufacturers at prices higher than asked by machinery dealers. Inquiries for used tools are few.

Small tools continue to move freely, and it is expected that sales in 1928 in all probability will be the largest for any year since the war.

General Electric Co., West Lynn, Mass., has started work on a two-story, 20 x 100 ft. power house addition.

Work has been started on a one-story addition, 44 x 149 ft., by the Providence Lithograph Co., Prairie Avenue, Providence, R. I. Miscellaneous electrical equipment will be used.

Westfield Boy's Trade School, Westfield, Mass., C. Derby, principal, is having plans prepared for a two-story and basement addition, 72 x 118 ft. Ralph M. Sizer, 12 Elm Street, Westfield, is architect.

Ovens, power equipment, conveying and other machinery will be installed in new one-story plant, 100 x 150 ft., to be built by Fraser Baking Co., 50 Cherry Street, Burlington, Vt., to cost over \$85,000.

Horace R. Whittier Co., Bristol, Conn., has broken ground in Pequabuck, Conn., for an enameling plant, one-story, 50 x 100 ft. It recently sold its Bristol plant to a gas making company. Used and new baking and miscellaneous equipment will be required.

Lynd-Farquhar Co., 419-425 Atlantic Avenue, Boston, machine tools, will move to larger quarters at 326-330 Congress Street, South Boston, about Dec. 1.

Plans have been filed by Pratt & Whitney Aircraft Corporation, 450 Capitol Avenue, Hartford, Conn., for a one-story sheet metal shop addition.

Enterprise Mfg. Co., 164 First Street, Boston, manufacturer of copper and metal specialties, will establish a new plant at Cambridge, where production will be concentrated in future.

Gillette Safety Razor Co., 15 West First Street, Boston, has authorized increase in capital from 2,000,000 to 3,000,000 shares of stock, no par value, part of proceeds to be used for expansion.

Stamford Gas & Electric Co., Stamford, Conn., has plans for a new artificial gas plant, 50 x 105 ft., to cost over \$175,000.

Green Mountain Power Co., operated by People's Hydro-Electric Vermont Corporation, Montpelier, Vt., is planning new hydroelectric power project in Vermont

early next year, to cost more than \$1,000,000 with transmission lines. Company has work under way on similar project at Middlesex, Vt., to have initial capacity of 5000 hp. Arrangements have been concluded for purchase of hydro-electric and steam power plants of Woodbury Granite Co., near Hardwick, Vt., to be improved for increased capacity. E. C. Deal is president.

Officials of Wetmore-Savage Automobile Equipment Co., 584 Commonwealth Avenue, Boston, have organized Wetmore-Savage Aircraft Corporation, with capital of \$105,000, to operate local manufacturing and distributing plant. Robert B. Wetmore is president, and Charles Hyde, treasurer.

Providence Brass & Aluminum Foundry Co., 219 Aborn Street, Providence, R. I., has been organized to manufacture brass, bronze and other metal castings. Company has plant at above address and is in market for additional furnace molding machine and ingot metals. Arsen G. Avedisian is proprietor.

Landers, Frary & Clark, New Britain, Conn., have awarded contract to Morton C. Tuttle Co., Boston, for one-story enameling building, 135 x 200 ft., and one-story storage building, 30 x 123 ft. Platforms and concrete roadway are included and estimated cost of entire operations is \$110,000.

South Atlantic

BALTIMORE, Nov. 5.—Western Electric Co., 195 Broadway, New York, has acquired 125 acres at River View Park, Baltimore, for new plant for which plans will be drawn at once. Initial unit is reported to cost more than \$5,000,000.

Virginia-Carolina Rubber Co., 3500 Lewis Street, Richmond, Va., manufacturer of automobile tires, etc., is arranging expansion program to cost more than \$400,000, including buildings and equipment. Department will be established for production of mechanical rubber goods in addition to present output. Company is arranging for sale of note and stock issues to total about \$500,000.

Board of District Commissioners, District Building, Washington, will receive bids until Nov. 15, for metal shop, wood shop, including 11 motor-driven wood-turning lathes, and foundry equipment for McKinley high school, until Nov. 19 for 3041 steel single tier lockers for public schools.

Virginia Public Service Co., Charlottesville, Va., is disposing of bond issue of \$3,000,000, part of proceeds to be used for extensions and improvements, including transmission line construction. Company is said to be planning hydroelectric

power plant on Big and Little Rivers, Rockbridge County, to cost about \$2,000,000.

Board of Education, Baltimore, is said to be planning installation of manual training equipment in new three-story Northeast junior high school to cost \$500,000, for which bids will soon be asked on general contract. William W. Emmaft, Union Trust Building, is architect; C. L. Reeder, 916 North Charles Street, is mechanical engineer.

Draper Mfg. Co., Hopedale, Mass., manufacturer of textile looms and other textile machinery, has taken options on property near Spartanburg, S. C., for new branch assembling plant, to cost more than \$65,000 with equipment.

Chamber of Commerce, Charleston, S. C., is at head of project to construct and operate municipal airport on 800 acres at Ten-Mile Station, to include hangars, repair and reconditioning shops and other units, to cost more than \$60,000.

Joseph E. Sperry, Calvert Building, Baltimore, architect, has filed plans for five-story automobile service, repair and garage building to cost about \$200,000 with equipment.

Albert Lewis, Greenville, S. C., and associates plan construction of one-story ice-manufacturing plant, 75 x 100 ft., to cost about \$70,000 with equipment.

Salem Quarries, Inc., Winston-Salem, N. C., is planning an expansion program, including installation of quarrying, crushing and other machinery, power equipment, etc.

Lorenson-Harbottle, Inc., Aberdeen, N. C., has been organized to engage in fabrication of sheet metal, plates and shapes, including such products as vegetable bins, waste baskets, radiator enclosures. Company will also specialize in repair and maintenance of motors and power equipment. Plant has been erected and machinery installed.

Philadelphia

PHILADELPHIA, Nov. 5.—Pennsylvania Railroad Co., Broad Street Station, Philadelphia, has authorized electrification of its lines from New York to Philadelphia and thence to Wilmington, Del., about 325 miles, to be carried out over a period of seven to eight years at cost of about \$100,000,000, to be expended at rate of approximately \$15,000,000 per year; 60 per cent of cost will be for overhead transmission and catenary line construction, power substations, switching stations, etc., and 40 per cent for rolling stock. Initial work will cover electrification between Trenton and Philadelphia during coming year. Contracts

have been made with Philadelphia Electric Co. and Public Service Electric & Gas Co., Newark, N. J., for power supply and these utilities will expand generating and transmission facilities.

Lumber & Millwork Co., York Road, Philadelphia, will erect two-story addition to cost about \$50,000.

Publicker Commercial Alcohol Co., Snyder Avenue and McKean Street, Philadelphia, will rebuild plant destroyed by fire Oct. 28.

Keystone Brass & Rubber Co., 826 Arch Street, Philadelphia, has leased two floors in building at 117 North Third Street for expansion.

Philadelphia Nonferrous Foundry Co., Philadelphia, has been formed by Edward W. Taylor, Jr., 3030 Queen Lane, and associates, to operate a local plant for production of aluminum, brass, bronze and other metal castings. Andrew R. McCown, 814 Carpenter Street, is also interested in new organization.

New interests have become identified with Bellanca Aircraft Corporation, Wilmington, Del., and plans are being arranged for expansion. About \$2,000,000 will be added to company capital, considerable part of fund to be used for development work. Company has secured an initial order for 300 airplanes for an aviation service to be operated in West Virginia. Guiseppe M. Bellanca will continue as head of company.

School District of Upper Darby Township, Upper Darby, Pa., care of Heacock & Hokanson, 1211 Chestnut Street, Philadelphia, architects, plans installation of manual training equipment in new two-story junior high school to cost \$750,000, for which bids are being asked on general contract until Nov. 15.

Vacuum Oil Co., 61 Broadway, New York, has plans for a three-story addition, 40 x 80 ft., to its lubricating oil plant at Paulsboro, N. J., to cost over \$50,000 with equipment. H. J. Wright is chief engineer.

Diamond Machine Co., 453 North Marshall Street, Philadelphia, has purchased local property for new one-story tool manufacturing plant and machine works, to cost over \$40,000,000 with equipment.

George Bendon, Philadelphia, has leased property at 118 East Cumberland Street for a machine and automobile repair shop.

E. Keeler Co., Williamsport, Pa., manufacturer of boilers, has removed its Philadelphia office from Rush Building to 711 Bulletin Building. George W. Crawford and H. L. Peel are sales engineers in charge.

Buffalo

BUFFALO, Nov. 5.—Contract has been let by Joseph A. Sanders, 115-17 Lathrop Street, Buffalo, manufacturer of sheet metal products, roofing, etc., to William A. Walker, 24 Vernon Place, for two-story addition to cost about \$50,000 with equipment. H. E. Plumer & Associates, 775 Main Street, are architects and engineers.

New York Central Railroad Co., Buffalo, and 466 Lexington Avenue, New York, is said to be arranging early call for bids for one and two-story car repair shops at East Buffalo yards, to cost over \$65,000. F. B. Freeman is chief engineer.

Stewart Motor Corporation, 93 Dewey Avenue, Buffalo, manufacturer of motor trucks, has awarded general contract to Crooker & Carpenter, Crosby Building, for one-story addition, to cost about \$30,000 with equipment.

Officials of New York Car Wheel Co., Niagara Street and Forest Avenue, Buffalo, headed by Frederick B. Cooley, president, have acquired a substantial interest in Houde Engineering Corporation, 537 East Delavan Avenue, manufacturer of automobile shock absorbers. Houde company has work under way on addition to triple, approximately, present capacity.

Pratt & Letchworth Co., 189 Tonawanda Street, Buffalo, manufacturer of steel and malleable iron castings, has work under way on a one-story addition to power department, to cost about \$20,000.

Emil Steinhurst & Sons, Inc., 1158 Mohawk Street, Utica, N. Y., manufacturer of gas fired hot air furnaces, radiator shields and inclosures and other sheet metal products, is installing new power-driven machinery for production of heavy sheet metal shapes. Company will then be in position to manufacture steel stair raisers, road decks, metal shelving and other products.

Glor Brothers & Willis Mfg. Co., Attica, N. Y., maker of farm machinery and equipment, has been dissolved and business will be taken over by Hudson Mfg. Co., Hastings, Minn. Hudson company is said to be planning to spend \$100,000 in new buildings and equipment.

Cleveland

CLEVELAND, Nov. 5.—Machine tool inquiry is plentiful, but sales were not as large the past week as during the early part of the month. October business with most dealers showed a gain over September. The White Motor Co. has purchased a dozen or more machines required to manufacture a new type of truck motor. Orders from the automotive industry in the Michigan territory have declined following active buying, and it is believed that motor car companies now have their equipment well rounded out.

Wheeling & Lake Erie Railway has sent out an inquiry for estimating purposes for an 80-in. wheel press and horizontal punching machine. Plants of local machine tool builders are well filled with orders, and deliveries are slow. A manufacturer of drilling machinery reports that it has more orders on its books at present than at any previous time in its history.

Wheeler Radiator Mfg. Co., 1637 Colamer Road, Cleveland, is enlarging its plant by an addition to its office and extensions to its manufacturing department. Latter will include a chromium plating department.

Plans are being completed by Atlas Foundry Co., West Sixty-ninth Street, Cleveland, for one-story addition, 32 x 90 ft., to cost about \$38,000 with equipment. A. G. Simon, Hippodrome Building, is architect.

Gears & Forgings, Inc., 3010 Woodhill Road, Cleveland, has awarded general contract to Industrial Construction Co., 308 Euclid Avenue, for three-story and basement addition, 72 x 72 ft., to cost about \$50,000 with equipment.

City Council, Lorain, Ohio, has authorized purchase of steam turbine and auxiliary equipment for municipal pumping plant, to cost about \$28,000.

City Ice & Fuel Co., 6611 Euclid Avenue, Cleveland, is disposing of a preferred stock issue of \$2,400,000, part of proceeds to be used for expansion, including new ice-manufacturing plants. Plans are under way for new plant at

Willoughby, Ohio, to cost about \$200,000 with equipment.

Timken Roller Bearing Co., Canton, Ohio, plans new one-story manufacturing addition, 131 x 285 ft., to cost more than \$125,000 with equipment. An addition is also proposed for storage and distributing service.

Goodyear-Zeppelin Corporation, Akron, Ohio, a subsidiary of Goodyear Tire & Rubber Co., has approved purchase of site at Fulton Flying Field for construction of plant to manufacture two Zeppelin aircraft for Government, and similar units, consisting of main steel hangar, 360 x 1200 ft., and 200 ft. high, with machine and repair shops, metal-working shop, woodworking department, assembling buildings, and other units, to cost more than \$2,000,000 with equipment. Wilbur Watson & Associates, 4614 Prospect Avenue, Cleveland, are architects and engineers. Paul W. Litchfield is president.

Smith-Armstrong Forge, Inc., 1209 Marquette Road, Cleveland, has been organized to operate metal forge and machine shop. Building has been leased and contract let for remodeling. Equipment orders have been placed, and machinery will probably be installed and ready for operation Dec. 15. Company's product will include forgings for cam and crankshafts, spindles, gear blanks and pinions, bevel gears, die blocks and special parts for automobiles and machine tools. Stock of alloy steels, open-hearth, electric and tool steels and irons will be carried.

Chicago

CHICAGO, Nov. 5.—Inquiry for machine tools carried over from last month bulks large and fresh requests for prices indicate an unusually favorable outlook for November. Business is still quite widely scattered in this territory and in diversified industries. Purchases on a larger scale are indicated by agricultural machinery manufacturers.

International Harvester Co. is preparing a list for its Fort Wayne, Ind., works and Allis-Chalmers Mfg. Co., Milwaukee, plans sizable additions to its tractor plant at Springfield, Ill. It is probable that Emerson-Brantingham Co., Rockford, Ill., will place large orders concurrent with transfer of J. I. Case Threshing Machine Co.'s tractor plant from Racine, Wis., to Rockford. Nash Motors Co., Racine, Wis., is in market for two 16-in. lathes, and the Chicago Board of Education will buy a 16-in. back geared shaper.

Bids will soon be asked by Buda Co., Harvey, Ill., manufacturer of railroad equipment and appliances for one-story addition, to cost about \$70,000 with equipment. Perkins, Chatten & Hammond, 160 North LaSalle Street, Chicago, are architects.

Electric Household Utilities Corporation, South Fifth Avenue and Twenty-second Street, Chicago, will soon begin superstructure for one and two-story plant, 80 x 80 ft., and 80 x 400 ft., at Cicero, Ill., to manufacture electrically-operated domestic appliances, to cost more than \$100,000 with equipment. R. E. Pingrey, 134 North LaSalle Street, is architect.

Standard Oil Co. of Indiana, Inc., 910 South Michigan Avenue, Chicago, will soon begin construction of one-story storage and distributing plant at Mattoon, Ill., to cost about \$80,000 with equipment.

Andrews Wire & Iron Works, 1802 Preston Street, Rock Island, Ill., has awarded general building contract to

Holm-Page Co., 2117 Kishwaukee Street, for one-story addition, 100 x 125 ft., to cost more than \$80,000 with equipment.

Altorfer Brothers Co., Peoria, Ill., manufacturer of electric washing machines and parts, is disposing of a preferred stock issue of \$1,395,000, part of proceeds to be used for expansion. Company is planning one-story unit, 100 x 600 ft., to cost more than \$200,000 with equipment.

General Mills, Inc., Chamber of Commerce Building, Minneapolis, Minn., has awarded general contract to Pike & Cook Co., 416 South Fifth Street, for rebuilding part of flour mill recently destroyed by fire.

Federal Sign Co., 1215 Nicollet Avenue, Minneapolis, Minn., manufacturer of electric and other displays, has asked bids on general contract for new two-story plant to cost about \$35,000. Larson & McLaren, Baker Building, are architects.

Addison Cut Stone Co., 4424 Addison Street, Chicago, has acquired property 109 x 600 ft., for construction of new one-story stone-cutting and finishing plant, to cost more than \$70,000 with machinery.

Star Ornamental Iron Co., 2600 East Twenty-sixth Street, Minneapolis, has been organized to engage in ornamental iron work. Company has plant completely equipped but is in market for materials.

Moline Mfg. Co., Moline, Ill., which early this year succeeded Wilson Body Mfg. Co., is diversifying its line of products and discontinuing largely line of automobile bodies. It is also preparing to introduce line of playground equipment.

Kennedy-Van Saun Mfg. & Engineering Corporation, 2 Park Avenue, New York, manufacturer of crushing, mining and cement machinery and pulverized coal equipment, has established Kennedy-Van Saun Co. of Illinois, 120 South LaSalle Street, Chicago, to handle its business in that territory. T. J. Shearer is manager.

Pittsburgh

PITTSBURGH, Nov. 5.—Interest of the machine tool trade centers in the new Aston process iron plant of the A. M. Byers Co. at Harmony, Pa. No formal inquiry yet has appeared, but dealers are looking for one including the requirements for an entirely new machine shop. Westinghouse Electric & Mfg. Co. is buying in a moderate way against its fourth quarter list. Day to day orders are fairly numerous, and business on the whole is reasonably satisfactory.

Plans are being considered by Pittsburgh Plate Glass Co., Frick Building, Pittsburgh, for two-story addition to branch plant at Crystal City, Mo., 100 x 1000 ft., to cost more than \$750,000 with equipment. Engineering department of company is in charge.

Waverly Oil Works, Inc., Thorn Street, Coraopolis, Pa., will rebuild portion of local lubricating oil plant destroyed by fire Oct. 28. Headquarters are at Fifty-fourth Street and Allegheny Valley Railroad, Pittsburgh.

New interests, headed by Henry S. Sherman and Ralph H. Tate, latter head of Ralph H. Tate Co., Inc., First National Bank Building, Pittsburgh, steel products, have purchased Fort Pitt Spring & Mfg. Co., Pittsburgh, with plant at McKees Rocks, Pa. Company name will be changed to Fort Pitt Spring Co. and expansion carried out. William McBride, heretofore president, has retired from that office.

Mackintosh-Hemphill Co., foot of

Twelfth Street, Pittsburgh, manufacturer of rolling mill machinery, etc., has asked bids on general contract for one-story branch plant at Wooster, Ohio, to cost about \$80,000 with equipment.

Wheeling Electric Co., Wheeling, W. Va., has acquired electric light and power properties of Wheeling Public Service Co., exclusive of traction system. Plans are under way for extensions, including power line construction.

Board of Education, Beaver Falls, Pa., is said to be planning installation of manual training equipment in new high school to cost \$250,000, for which plans will be drawn by Carlisle & Sharrer, Martin Building, Pittsburgh, architects.

Cincinnati

CINCINNATI, Nov. 5.—Machine-tool builders report that sales in October showed a gain over those of September and that the past three months have been the best period for new bookings since 1920. While much of the business has come from the automotive industry, the volume of buying in many lines has been surprisingly good. Geographically, purchases have been well distributed, even the Pacific Coast having contributed its share.

Just what turn demand will take in the next few weeks is puzzling some manufacturers, although the majority are of the opinion that activities will be well sustained at or near the present level. Even if there is a considerable drop in orders, which would be a somewhat unexpected development, there is enough business on the books of local companies to keep operations at a high point during the remainder of the year. This fact is evidenced by the extended deliveries quoted on many types of machines. Preference for small tools and for larger equipment designed for high production work is shown by most buyers.

To what extent automobile makers will come into the market for equipment in the next two months is a matter of speculation, but indications are that companies which already have made substantial purchases in connection with the production of new models will buy additional machines shortly when increased operating schedules have been decided upon. This particularly applies to some units of the General Motors Corporation.

Revised plans are being drawn for one-story addition, 165 x 485 ft., and boiler plant for Leland Electric Co., 222 North St. Clair Street, Dayton, Ohio, manufacturer of small motors, armatures, etc., to cost more than \$225,000 with equipment. Ballinger Co., Twelfth and Chestnut Streets, Philadelphia, is architect and engineer.

Falls City Ice & Beverage Co., Broadway and Thirty-first Street, Louisville, is planning expansion program, including erection of two one-story mechanical shops, extensions in ice department and bottling division, with conveying and other handling equipment, to cost more than \$50,000.

Plans have been arranged for reorganization of American Hoist Co., Hamilton Bank Building, Chattanooga, Tenn., with change of name to American Automobile Appliance Co., capitalized at \$1,000,000. Expansion will be carried out, with extension in production to include automatic air brakes, axle type automobile elevators and kindred equipment.

Cincinnati Grinders, Inc., South Oakley, Cincinnati, has awarded general contract

to Austin Co. for one-story plant to cost about \$65,000, with equipment.

Hart, Freeman & Roberts, Independent Building, Nashville, Tenn., architect, have plans for new multi-story automobile service, repair and garage building, to cost more than \$150,000 with equipment.

St. Louis

ST. LOUIS, Nov. 5.—Contract has been let by Metalcraft Corporation, 4215-19 Clayton Avenue, St. Louis, to Schooley & Chamblin, 6038 Delmar Boulevard, for new one-story plant to cost about \$65,000 with equipment.

Laclede Steel Co., St. Louis, is inquiring for a 42-in. x 29-ft. geared head motor-driven lathe.

N. S. Sherman Machine & Iron Works, 18 East Main Street, Oklahoma City, Okla., is completing plans for one-story addition, 50 x 140 ft., to cost about \$35,000.

Parks Aircraft, Inc., Missouri Theatre Building, St. Louis, has awarded general contract to St. Louis Structural Steel Co., Fifty-seventh Street, for initial unit of aircraft manufacturing plant at East St. Louis, comprising parts and assembling departments, one-story, 100 x 550 ft., to cost more than \$150,000 with equipment. Company was organized recently by Russell E. Gardner, head of Gardner Motor Co., Main Street, and associates.

Superintendent, Sequoyah O. T. School, Tahlequah, Okla., is asking bids until Nov. 12 for one duplex power pump, capacity 100 gal. per min., and for one two-stage air compressor.

Atlas Tool & Mfg. Co., 5707 Manchester Street, St. Louis, will soon begin construction of new one-story plant, 60 x 100 ft., to cost about \$20,000 with equipment.

Oliver-Cadillac Co., 3222 Locust Boulevard, St. Louis, representative for Cadillac automobile, is having plans drawn for three-story service, repair and sales building, to cost about \$100,000 with equipment.

City Council, Trenton, Mo., is having plans drawn by Burns & McDonnell Engineering Co., Interstate Building, Kansas City, Mo., engineer, for extensions and improvements in municipal power plant, including additional equipment.

Detroit

DETROIT, Nov. 5.—Plans are being considered by Detroit Gear & Machine Co., 670 East Woodbridge Street, for four-story addition, 70 x 140 ft., to cost about \$80,000 with equipment.

Tri-Service Mill Building Supply Co., 269 Thirty-second Street, Battle Creek, Mich., is considering one-story addition, to cost more than \$30,000 with equipment.

Rich Tool Co., 1501 East Ferry Street, Detroit, recently organized to take over and operate company of same name, manufacturer of valves and other forged parts for automobile engines, etc., is disposing of stock issue to total about \$3,487,000, part of proceeds to be used for expansion.

Wood Hydraulic Hoist & Body Co., 7924 Riopelle Street, Detroit, has awarded general contract to Otto Randolph, Inc., 53 West Jackson Boulevard, Chicago, for one-story addition, 50 x 340 ft., to cost more than \$75,000 with equipment.

Weber & Pitcher, Fullerton Street, Detroit, manufacturers of chassis for small

trucks and other cars, are said to be planning early rebuilding of part of plant recently destroyed by fire.

Gliders, Inc., Detroit, recently organized with capital of \$37,500 by A. V. Verville, 3318 Tuxedo Street, and associates, plans early operation of local plant to manufacture motorless airplanes. W. J. Scripps, 8100 East Jefferson Street, is also interested in company.

Upton Machine Co., Edgewater Street, St. Joseph, Mich., is considering one-story addition to cost about \$25,000. L. C. Upton is head.

Oakland Motor Car Co., Pontiac, Mich., is having plans drawn for two-story addition, 50 x 100 ft., to cost about \$60,000. Albert Kahn, Inc., Marquette Building, Detroit, is architect and engineer.

Wilcox-Rich Corporation, Wilcox Products Division, Saginaw, Mich., manufacturer of automobile parts and equipment, plans one-story addition, 35 x 275 ft., to cost about \$60,000 with equipment.

Motor Wheel Corporation, Saginaw Street, Lansing, Mich., has awarded general contract to H. G. Christman Co., Lansing, for one-story addition, to cost about \$175,000 with equipment. Company is also considering two other one-story units for hub division and for die and tool department.

Szekely Automotive Parts Corporation, Holland, Mich., has been organized as subsidiary to O. E. Szekely Corporation to manufacture piston rings. Company later expects to widen its field to include other automotive parts and accessories

Gulf States

BIRMINGHAM, Nov. 5.—Plans have been filed by United States Cast Iron Pipe & Foundry Co., American Traders National Bank Building, Birmingham, for one-story plant addition, 80 x 255 ft., to cost close to \$40,000 with equipment.

Chamber of Commerce, Lubbock, Tex., is at head of project to construct and operate a municipal airport, including hangar, repair and reconditioning shop and other units, to cost approximately \$50,000.

Fleischmann Co., 327 South La Salle Street, Chicago, manufacturer of yeast, has plans for two-story addition to branch factory at Houston, Tex., 75 x 100 ft., to cost about \$70,000 with equipment.

City Commission, St. Petersburg, Fla., has authorized plans for a municipal airport in port district, to be known as Albert Whitted airport, with hangars, repair and reconditioning shops and other units.

De Soto Foundry & Machine Co., Mansfield, La., has arranged for bond issue of \$75,000, part of proceeds to be used for expansion in production facilities, particularly in steel castings.

Alabama Power Co., Birmingham, has work in progress on first unit of new steam-operated electric generating plant at Gorgas, Ala., and is scheduling completion in about six months. It is estimated to cost about \$5,000,000; complete project, with transmission lines, will cost approximately \$20,000,000.

Rome Wire Co., Bay Front, Mobile, Ala., has awarded general contract to Doulett & Ewin, Meaher Building, for one-story unit, to cost more than \$30,000 with equipment.

Pan-American Petroleum Corporation, Edwards Hotel Building, Jackson, Miss., has plans for new storage and distributing plant, with part to be equipped for barreling service, to cost about \$100,000.

R. J. Cummings, Bankers Mortgage Building, Houston, Tex., architect, is completing plans for multi-story automobile service, repair and garage building, 100 x 130 ft., at Corpus Christi, Tex., to cost about \$100,000 with equipment.

Tangipahoa Parish School Board, Amite, La., is said to be planning installation of manual training equipment in two-story high school at Independence, to cost \$160,000, for which bids will be asked about middle of November on general contract. Robert H. Goodman, Bank of Baton Rouge Building, Baton Rouge, La., is architect.

General Water Works & Electric Corporation, Fort Worth, Tex., operating Texas-Louisiana Power Co., Fort Worth, and other electric light and power utilities, has arranged for sale of preferred stock to total \$1,400,000, a portion of proceeds to be used for expansion, including transmission lines.

Stockham Pipe & Fitting Co., Birmingham, will erect two-story warehouse and shipping building, 104 x 251 ft., and laboratory, 60 x 95 ft. Contract has been placed with H. K. Ferguson Co., Cleveland. It is expected that plant will be finished by Jan. 1.

Pacific Coast

SAN FRANCISCO, Nov. 1.—Santa Fe Railway Co., Los Angeles, has plans for one-story ice-manufacturing and pre-cooling plant, 100 x 184 ft., at Bakersfield, Cal., to cost \$185,000 with machinery.

Hall-Scott Motor Co., Pine Street, Berkeley, Cal., has awarded general contract to Austin Co. of California, Ray Building, Oakland, for one-story factory unit to cost about \$35,000 with equipment.

Board of Regents, University of California, Berkeley, is said to be planning new central power plant on campus, to cost about \$400,000 with equipment.

Pacific Goodyear Co., Los Angeles, subsidiary of Goodyear Tire & Rubber Co., Akron, Ohio, will carry out an expansion program at local mill, to cost more than \$250,000 with machinery.

Pacific Aero Motive Corporation, 3417 Angeles Mesa Drive, Los Angeles, manufacturer of aircraft equipment, is completing plans for one-story addition, 50 x 120 ft. Harbin Hunter, Rives-Strong Building, is architect.

Edward Hines Western Pine Co., Burns, Ore., has plans for addition to mill to cost about \$75,000 with equipment. Peter Swan, Lewis Building, Portland, is engineer and will be in charge of machinery purchases.

Palin & Sons, Inc., Tacoma, Wash., will rebuild portion of oil refinery recently destroyed by fire.

Board of County Supervisors, Hall of Records, Los Angeles, is asking bids until Nov. 19 for deep well pumping machinery and accessory equipment for County farm property.

Bach Aircraft Co., Los Angeles, has asked bids on general contract for new plant at Metropolitan Airport, near North Hollywood, comprising two main units, 100 x 200 ft., and 50 x 65 ft., to cost approximately \$45,000 with equipment. Mark M. Falk, Washington Building, is architect.

St. Helens Pulp & Paper Co., St. Helens, Ore., has awarded general contract to A. Guthrie & Co., Sherlock Building, Portland, for new one-story

mill, 215 x 320 ft., to cost over \$150,000 with equipment.

Harbor Plywood Co., Aberdeen, Wash., is planning to rebuild part of mill destroyed by fire Oct. 22.

Indiana

INDIANAPOLIS, Nov. 5.—Plans are being completed by C. R. Wermuth, 1036 St. Marys Street, Fort Wayne, Ind., for one-story machine shop, 75 x 108 ft., to cost about \$21,000 with equipment. Pohlmeier & Pohlmeier, Central Building, are architects.

Richmond Casket Co., Sixteenth and F Streets, Richmond, has plans for four-story plant, to cost over \$50,000 with equipment. F. J. Hughes, Inc., U. B. Building, Dayton, Ohio, is architect.

International Harvester Co., 606 South Michigan Avenue, Chicago, has awarded general contract to G. E. Dahm, 319 North Twenty-sixth Street, Lafayette, for one-story machine shop at Lafayette, to cost about \$50,000 with equipment.

Goble Gas Regulator Co., 233 Sycamore Street, Anderson, manufacturer of gas-burning apparatus, has plans for one-story addition, 25 x 80 ft., to cost about \$25,000. E. F. Miller, Farmers Trust Building, is architect.
